Linda Boxer	<i>Professor of Medicine and Chief, Division of Hematology, Department of Medicine</i>
Al Lane	<i>Professor of Dermatology and Chair, Department of Dermatology</i>
Stephen Galli	<i>Mary Hewitt Loveless Professor of Pathology and Chair, Department of Pathology and of Microbiology & Immunology</i>
David Stevenson	<i>Vice Dean and Senior Associate Dean for Academic Affairs, Harold K Faber Professor of Pediatrics</i>

Special thanks must go to Dr. Hannah Valentine for her dedication and wonderful leadership of this and related programs. I also want to thank Jennifer Scanlin, the Program Manager for the Office of Diversity and Leadership, along with Lydia Espinosa, Administrative Associate, for their many contributions.

The Potential of an Evolving Role of the MCAT in the Evaluation of Medical School Applicants

One of the key milestones to gaining entrance to medical school is the Medical College Admissions Test (MCAT) – some version of which has been around since 1922, twelve years after the Flexner Report on Medical Education. Over the past 88 years, the format of the MCAT exam has been reviewed some five times – the last review was nearly two decades ago, even though there have been regular updates in content. Two years ago the Association of American Medical Colleges (AAMC) appointed a 22 member task force led by Dr. Steve Gabbe, Senior Vice President for Health Sciences and CEO of the Ohio State University Medical Center, to critically examine the future of the MCAT. Called the MR5 committee, it is comprised of experts and leaders from academic medicine, including deans, admissions officers, representatives from student and educational affairs and diversity offices, and basic and clinical faculty along with other college faculty and leaders and medical students.

The MCAT has largely focused on knowledge content and aptitude for science and medicine. The MR5 committee has already reached out to over 1200 medical school faculty, residents and students about how the current MCAT format predicts success in medical school – or more broadly, in medicine. An important and unresolved issue is whether medical schools do enough to examine the personal and professional attributes of applicants and how those correlate with outcomes in medicine.

Whether an exam can and should seek to define the personality profile that characterizes a doctor is a matter for serious discussion and debate. Dr. Pauline Chen began addressing this topic in an opinion piece entitled “Do You Have the ‘Right Stuff’ to be a Doctor” in the January 15th issue of the New York Times (see:

<http://www.nytimes.com/2010/01/15/health/14chen.html?scp=3&sq=pauline%20chen&st=cse>).

Dr. Chen notes that some medical schools have begun administering personality tests and have noted some correlation with success in medical school and beyond. Whether this should become a feature of the MCATs is one of the key issues that the MR5 committee will be grappling with over the next two years.

Combining scales and measures to evaluate both the skills to learn and practice medicine and the personality features that define a potential for professionalism and excellence in medicine is important but also challenging. Success in medicine comes in many forms, since career opportunities are highly variegated and can evolve over time. Significant caution needs to be exercised in making sure that personality tests, if used, do not become too proscribed, monotonic or limiting. What defines the personality profile of an MD who discovers new ways of understanding human biology or new ways to treat or prevent disease is likely quite different from metrics that might define a primary caregiver. My guess is that there will be some significant overlap, especially since within the life of a physician careers as an investigator, healthcare provider and administrator can unfold over time or even concurrently. The more important goal would be to delineate personality metrics that might predict adverse outcomes or unsuitability for medicine.

These are important issues, and I suspect that many of you are unaware that these discussions are even taking place – much less possibly moving toward recommendations in the next couple of

years. I will certainly do my best to keep you apprised as information unfolds. Certainly feel free to share your thoughts and I will make sure they get to the MR5 committee.

Stanford Mini-Med School: Take Two

On January 12th we welcomed a new class to the second quarter of our highly successful Mini-Med School. As with our Fall Quarter, the Winter Quarter was filled to capacity (250 participants and a long waiting list). The course remains the most popular among all Stanford Continuing Studies programs. The first session set the bar quite high for all future presentations. Dr. Geoff Rubin, Professor of Radiology, gave a tour de force lecture entitled “Inside Out: How Imaging Technology Offers a Portal to Human Anatomy and Disease” that reviewed the history and current as well as future applications of radiography, CT imaging, ultrasonography, MR imaging and nuclear imaging. And Dr. Dan Bernstein, Alfred Woodley Salter and Mabel Smith Salter Endowed Professor in Pediatrics, delivered the January 19th lecture on “The Developing Heart in Health and Disease”. Future programs will include presentations on vascular disorders of the nervous system, vision in health and disease and a number of other exciting topics.

The programs from the Fall Quarter have started to be available at Stanford on iTunes U. In addition, the School of Medicine will launch a dedicated web site in early February for the lectures. We will let you know when it is available for viewing.

Awards and Honors

- ***The Kidney Transplant Team*** has once again been cited by the Scientific Registry of Transplant Recipients as the best in the nation in exceeding higher than expected results in both patient and graft survival at one and three years following transplantation. Thanks to the leadership of Drs. Stephan Busque and John Scandling and an outstanding transplant team, this service continues as one of the very best anywhere. Thanks and congratulations to an outstanding clinical service.

Dean's Newsletter February 8, 2010

Translating Discoveries: the 2010 Strategic Leadership Retreat

On Friday, February 5th we held our Annual Strategic Planning Leadership Retreat. We brought together just over 90 leaders from the basic and clinical departments, the institutes and the Dean's Office, as well as faculty and staff leaders, student and postgraduate leaders, and leaders and officials from the hospitals, the SHC Board of Directors and the University. Because of the economic downturn, I decided to keep the retreat local and to reduce it from two days to one. It was held at the Quadrus Conference Center on Sand Hill Road, and we took as our theme *Translating Discoveries 2010*. Despite the truncated schedule I found that the retreat provided an outstanding opportunity to review our progress on some of the key initiatives regarding faculty development that were stimulated at the 2009 Strategic Planning Leadership Retreat and

to focus attention on important themes for Stanford Medicine in the years ahead. I will give some of the highlights of the retreat in this newsletter and will plan to drill down on specific initiatives in forthcoming issues.

The retreat was bookended by thought-provoking presentations by two notable leaders. We opened with a talk by Dr. Rick Klausner, former Director of the National Cancer Institute (where I interacted with him quite closely) and past Executive Director for Global Health of the Bill and Melinda Gates Foundation. Dr. Klausner is presently serving as Managing Partner for The Column Group and serves as advisor to a number of world and government leaders on health, science and education. The retreat closed with a dinner presentation by Bob Klein, well-known in California as the leading force for Proposition 71 and President of the California Institute of Regenerative Medicine. Both Rick Klausner and Bob Klein are “out-of-the-box” thinkers, and each raised important questions, challenges and issues regarding the current status of biomedical research and its future – focusing on translational research – or, as Dr. Klausner refers to it, “translatable discoveries.”

Rick Klausner highlighted the limitations of the current funding models for research – especially at the NIH. He also addressed the impediments of moving basic science discoveries to clinical medicine, including the length of time and risks involved and how this is impacting the viability of the biotechnology industry. He advocated a shift in thinking to a greater focus on “problem solving” research. This would require a change in the ethos of the research establishment – away from the way scientists and clinicians currently think and interact and to the way technology transfer occurs. It would require thinking about different – and more broadly defined – funding sources (a theme Bob Klein picked up in his presentation at the end of the retreat). I have to admit that I resonated to Rick Klausner’s problem solving approach, since I tried to invoke it nearly two decades ago in solving problems in child health. In fact I pushed it to the point of establishing a national network to address problem solving in pediatric research (the Glaser Pediatric Research Network), but the funding sources were not available to sustain the effort. Perhaps that is something that is changeable and that could promote this concept on a larger level.

As I noted, Bob Klein also pursued a theme of out-of-the-box thinking about how to fund biomedical research – and offered provocative perspectives on how research might be supported in the future based in part on how the model for Prop 71 and CIRM was formulated. The intriguing prospect of a global fund for biomedical research echoed some of the ideas put forth by Rick Klausner and provide the basis for further thinking and discussion.

We also had two truly outstanding scientific presentations that serve as exemplars of what makes Stanford such a remarkable institution. The topics were chosen to illustrate the connections between basic science and clinical medicine and how knowledge and experience on each side of this equation inform and stimulate the translation of discoveries. Mark Krasnow, Professor and Chair of Biochemistry, reviewed the evolution of his research in the development of the lung, which began in experimental models and has moved to the elucidation of this process in humans and which now has important implications for studying diseases like asthma and cancer. Karl Deisseroth, Associate Professor of Bioengineering and Psychiatry, demonstrated how his experiences with human depression prompted him to better understand current psychiatric

therapies, which led to his fundamental discovery of optogenetics and the development of tools that help elucidate brain function. Both Mark Krasnow and Karl Deisseroth had training in medicine and science, and both recognize the importance of interactions and collaborations between basic and clinical science as well as interactions with faculty in other schools at Stanford in promoting new ideas and fostering the translation of their discoveries.

We also explored three major topics directly related to *Translating Discoveries 2010* through faculty panels that elicited great interaction and discussion. Background material was available to the participants, including excerpts from the recently published book The Vanishing Physician-Scientist (edited by Dr. Andrew Schafer. Ithaca: Cornell University Press, 2009). The panels included:

1. ***Educating Physician Scientists and Translating Scientists.*** Panel members were Drs. Karl Deisseroth, Sam Gambhir, Geoff Gurtner, Seung Kim, Holbrook Kohrt, and Mark Krasnow.
2. ***What Are the Necessary Ingredients for Promoting Interdisciplinary and Interdepartmental Research and Education?*** Panel members were Drs. Russ Altman, Jim Ferrell, Sherril Green, Karla Kirkegaard, Hugh O’Brodvich, and Anne Villeneuve.
3. ***How Can We Better Secure Faculty Success? Exploring Models for Mentoring and Career Development.*** Panel members were Drs. Steve Galli, Ann Leung, Frank Longo, Jody Puglisi, Christy Sandborg, and Mike Snyder.

We will be distilling the discussions that took place by these panels, and I will report on our synthesis, recommendations and action items in future newsletters. As I reflect on the overall discussion, I take note of the common threads that emerged from the discussion and that link these important topics. The first is how much the medical school benefits from being an integral member of a great university. The geographic proximity to the other Stanford schools fosters incredible interactions among faculty and students. In addition, the highly entrepreneurial spirit of our community and our desire to think boldly benefits enormously from the Stanford culture. Our shared focus on quality over quantity permeates the entire Stanford community. Of course that means that in a school like Medicine we have a number of important disciplines that are represented by only a handful (or less) of people. On the other hand, our small size promotes interactions and makes it important that each recruitment seek the very best – whether student, staff or faculty. Another important common thread is time and the many demands we all face in striving for excellence in our multiple missions. The limits of time are expressed differently in education, research and career development.

For example, there is no question that the length of time required to become a physician-scientist or a scientist focused on basic research and/or translational medicine is excessive. While efforts are being made to address this in different residency programs (e.g, cardiovascular surgery, neurosurgery and others) it is really the continuum from undergraduate (college) to medical and/or graduate school to postdoctoral training that poses the challenge. Each of these sectors is discrete and governed by different regulations and certifications. We have been discussing how to take some bold steps and develop new pathways toward educating and

training future physician-scientists and translating scientists in a more focused and compressed manner. I truly think we have the opportunity to do something unique at Stanford, and this will surely be a topic for future exploration and discussion.

The limitation of time is certainly a factor in the ability of our faculty to engage in interdisciplinary research and education. This is true for faculty engaged in full-time research, but is particularly the case for those at the interface between research and patient care. Some of the hurdles can be overcome by seed funding that brings faculty and especially students and postdocs together to address novel research opportunities. This can also be enhanced by shared faculty and student meetings within departments and facilitated by connections forged through the Institutes of Medicine, BioX or chance meetings among faculty and students. At the same time, the pressures of time (for writing grants, doing research, caring for patients, teaching) negatively affect opportunities to attend seminars or other events that might stimulate new knowledge or new possibilities for collaboration.

A number of concrete suggestions were put forth about how to deal with some of these challenges and they too will be discussed in future events and newsletters. A notable external validation of how well we are doing in interdisciplinary research and education – in fact likely far better than virtually any other institution – was also conveyed by one attendee. There is no question that we are more likely to highlight what is wrong than what was successful. So, it is important to point out the areas of achievement – even though we don't want to rest on laurels and do want to remain motivated to constantly strive to do better.

Not surprisingly, time is also a challenge in securing faculty success – both for faculty and for their advisors and mentors. We heard some important approaches to mentoring from departments that made this an area of focus following the 2009 Retreat. Indeed, evidence of success was forthcoming from both basic science departments as well as larger clinical ones. But there appears to be dissonance between the overall satisfaction of our faculty (where we score at the top in various comparisons with other medical schools) compared to perceived success in mentoring (where we seem to do less well). Whether this is a definitional problem or a real one is an important question, as is the degree of additional effort we should expend to promote even better outcomes. Because there is still considerable attrition of faculty out of careers as physician scientists or academic scientists, especially of women and members of underrepresented minority groups, I strongly believe we have much more work to do in this area – particularly for our clinician-scholars and scientists. In my opinion, we still need to address some novel and different approaches that run against current accepted norms – but I don't believe we can afford to not do this.

In sum, we covered a fair amount of ground in some important areas of academic medicine. I have touched on a few highlights and am purposefully leaving the details for additional distillation and refinement – with the goal of setting some new priorities that we can focus on over the months ahead. Clearly more to follow!

Federal Budget for Science and the NIH: The Ups and Downs

During my 23 years as an Intramural Investigator at the National Institutes of Health (NIH) there were lots of ups and downs in NIH funding. But the downs were usually short-lived, rarely exceeding two years, and the ups were generally modest, generally at or slightly above inflation. Overall the NIH budget climbed over time – but slowly, and when I left Bethesda for Boston in 1996, the overall NIH budget was just over \$13 billion. At that time the NIH enjoyed strong bipartisan support, and the promise that science would yield discoveries that would improve the lives of patients across a number of serious human diseases loomed large. While it now seems like ancient history, this was also the time when the public and the Congress were learning about the human genome, and the “big science” effort to sequence the genome was often heralded with promissory notes of how cures would soon follow the unraveling of the language of life. It was also during this time that new treatments were changing the outcomes for patients with HIV/AIDS – a disease that had only been recognized some 15 years previously and that had captured the public’s attention and fears.

Advocacy for biomedical research was supported by a large number of quite varied disease advocacy groups – especially cancer, AIDS, and diabetes – and was joined by the scientific community, universities, research institutions and beyond. This led to the plan to double the NIH budget over a five-year period, which began in 1998 and continued through 2003. Expectations for the impact of this significant incremental funding on the creation of new diagnostics, therapies and preventive strategies were high and were fueled by promises, even if well intentioned, that exceeded reality. In retrospect, it cannot be seen as a surprise that, in 2002 and 2003, the Congress began asking for the breakthroughs and cures emanating from the doubling. While much important work was accomplished, the reality is that tangible deliverables of the translation of basic research into clinical care often require years and sometimes decades. As a community we did not do a good job of delivering that message – and, in fact, we spent too time focused on the promise that research discoveries would reap benefits in ways that were really unrealistic. We should not forget that lesson.

As a consequence, from 2003 through 2009, when the American Recovery and Reinvestment Act of 2009 (ARRA) was launched as part of the “stimulus plan,” the NIH budget had been held flat for 6 years – losing some 17% of its buying power in 2008 compared to 2003. The consequences of flat funding for faculty, trainees and institutions across the nation were significant. These were made even worse by the anti-science mood that was increasingly expressed from Washington but also observed in many sectors of our country. Not surprisingly the mood of many scientists was worried and sometimes gloomy, and the pressures to submit more and more grants for less and less funding eroded much of the enthusiasm of years past. That changed in 2009 with the \$8.2 billion that the NIH was to spend over two years to support biomedical research, coupled with an administration that clearly signaled that it values science and innovation. The medical and scientific community once again rose to the occasion and savored the increased funding.

From the moment the ARRA funding began there was anxiety about what would happen in FY2011 – when the two years ended. Some believed that the ARRA funding would reset the NIH “base” at \$37-40B, making up for the losses of 2003-2008, and “right size” our scientific enterprise. There is no question that, like medical schools across the country, Stanford has benefited from the ARRA support (see: <http://med.stanford.edu/stimulus/> on “Investing in

Medicine”). Others, and I admit I was in this group, did not see the resetting of the NIH base as likely, given the overall economic climate. In fact, a number of colleagues and I would argue instead that sustainable funding that kept pace or exceeded inflation would be more important for our scientific enterprise than the boom or bust cycle that has characterized the last dozen years.

Of course hopes of even keeping pace with inflation seemed low when the President announced a freeze on spending (with some notable exceptions) last week. Forecasts for NIH looked gloomy indeed. And while they are still below where we would like, the fact that the President’s budget proposed an increase for NIH is further evidence of the Administration’s support for scientific research. With the release of the budget this past week, NIH is slated for a 3.2% increase over last year’s base to \$32.089 billion. This increase is at the projected level of the Biomedical Research and Development Price Index (BRDPI). Further, the President’s budget proposes a 6% increase in training grant stipends and a 2% increase in the average noncompeting and competing RPG. Given how funding for nearly all other programs is likely to fare, this must be seen as good news and as a vote of confidence for science – even though it will still put a lot of pressure on faculty and trainees competing for grants.

In addition to funding for NIH, other components of biomedical research and healthcare sector were included in the President’s budget, including:

- Health Professions: Title VII and Title VIII health professions education programs indicates a 2.2 percent increase over FY 2010NHSC
- The National Health Service Corps budget is proposed for a 19% increase over FY10 – to \$169 million
- The Agency for Healthcare Research and Quality has the largest percent increase (53.9%), an increment of \$214 million to a proposed \$611 million in FY 2011
- The President’s FY 2011 budget also requests a 1.5% increase for research at the VA, bringing the total to \$590 million for VA research.

Overall, these current proposals are much more favorable than what many of us assumed just a week ago – even if less than what was hoped for two weeks ago. Of course these remain budget proposals and there is a lot of political maneuvering that will occur before the FY11 budget is fully defined. But at least the NIH is projected to keep pace with BRDPI. Hopefully we can get back to a time of more sustainable funding – and put the up and down rollercoaster behind us. And as noted earlier in this newsletter, we also need creative new ways to foster biomedical research funding – perhaps on a global level.

Translating Breakthroughs in Stem Cell Research

At the CIRM (California Institute for Regenerative Medicine) meeting on February 4th, the translational research project led by Dr. Al Lane, Professor and Chair of Dermatology, was

presented at a public forum. Dr. Lane, together with his colleagues Dr. Anthony Oro, Associate Professor of Dermatology, and Dr Marius Wernig, Assistant Professor of Pathology, discussed how they are building on nearly two decades of basic research to translate their discoveries to treat the dominant form of epidermolysis bullosa (EB). This tragic disease occurs in both a dominant and recessive form (which is the most severe) and has devastating consequences for affected children. Over years of remarkable research the Stanford team has developed an understanding of the molecular underpinnings that define this disease and have developed two approaches – one based on gene therapy and the second utilizing induced pluripotent stem cells (iPS). The latter approach resulted in a major disease team award from CIRM (one of four received by Stanford faculty: http://deansnewsletter.stanford.edu/archive/11_09_09.html#3 and see: <http://med.stanford.edu/ism/2009/october/cirm.html>). The story told by Drs. Lane, Oro and Wernig is inspirational – and was made even more so by Ms. Lynn Anderson, President and Founder of the EB Medical Research Foundation – who recounted the incredible struggle of her two children, both of whom ultimately died of EB after years of suffering. The potential for hope emanating from basic and translational research serves as an exemplar of our mission at Stanford and our goal of finding treatments that improve the lives of adults and children facing serious and catastrophic disease.

Healthcare: The Role of Protocols

Rest assured. I won't offer any forecasts (and not even many comments) about where healthcare reform stands at this point – other than how relative it all is. Before the Senate election in Massachusetts I confess to being disappointed with how little the Senate and House Bills contained any substantive reform. Now even they look like an advance compared to where things now stand!

Regardless of what comes out of the Congress or Washington, it is important that we focus on doing what is right for health care: providing the best and most advanced clinical care possible, with outstanding quality and service and at the lowest cost possible. Coupled with this is continuing to innovate and bring knowledge from research to the patient. Also key is moving away from the perverse incentives that “fee for service” fosters to evidence-based care that improves health and does not overuse technology, expensive resources or tests and resources that are really not necessary.

I have long felt that one way to accomplish some of these goals is to take a lesson from how children with cancer are treated in the USA (and even worldwide). For decades, the vast majority of children with cancer have been enrolled in multicenter cooperative group protocols that assess and compare the current “state of the art” to something better. Sometimes that means more or different therapy and sometimes it means less treatment. But the overall formats of care (which diagnostic tests are indicated and when they need to be repeated; which technologies need to be deployed and when; which treatment schedule is used and how it is monitored and modified; what constitutes a positive or negative outcome) are organized by approved protocols. While some may view these as recipes for care, they actually serve to organize and codify complex regimens into clinical trials that optimize treatment as well as improve knowledge and advance the state of the art. Perhaps more than in any other area of medicine, protocol based therapy and clinical trials have become the accepted standard in pediatric oncology and, I believe, have also

contributed to the sequential improvements that have occurred over the past several decades in childhood cancer. It has also been demonstrated that simply being treated on a protocol improves outcomes – probably by better organizing and codifying the interventions that are employed.

An important question is whether this model can be accepted beyond pediatric oncology – an issue I have raised previously in this newsletter. There is no question that the pediatric oncology community has accepted protocol-based therapy as the standard. And there is no question that nearly all the rest of medicine has not gone down a similar pathway – including adult oncology. Thus, the introduction of protocol based regimens in various other diseases as the standard approach would require considerable organization as well as a culture change. Most physicians remain convinced that they must individualize care for each patient they treat, and they often eschew the concept of treatment algorithms or guidelines that emerge from clinical effectiveness studies. Indeed this became a political hot button during the health care debate last year. This issue was raised again in an opinion piece by Dr. Jerry Groopman in the February 11th issue of *The New York Review of Books* (see: <http://www.nybooks.com/articles/23590>). Dr. Groopman raises strong concerns about the wide use of clinical guidelines emanating from expert panels (he particularly raises concern about government panels) and cites some of his own errors in formulating specific guidelines for hematopoietic cytokines. I find many of his arguments compelling, but I see them as different from the use of clinical protocols in pediatric oncology, in which they serve as a dynamic form of clinical effectiveness guidelines. They are generated by experts and monitored for outcome, and they form the basis for future investigations and interventions.

As the healthcare debate recalibrates and rebases, I do think it would be interesting to test how well the protocol-based approach used in pediatric oncology can be used in other disciplines. Coupled with interactive electronic medical records, such protocol-based approaches could build in metrics for quality, utilization and better cost control. This approach does not require overregulation and it is compatible with individual decision-making whenever the conditions so require. It is a model worth exploring.

Developing a Community Network

For more than a year the leadership of the School of Medicine (SOM), Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH) have been exploring ways to reach out to physicians in our communities, both locally and regionally. The overarching goal is to create more effective communications with community physicians – especially those doing primary care – and to create alignments that improve the outcomes of the patients they serve. A number of mechanisms to foster a community network are being explored, and the opportunities for sharing information and technology are being evaluated. To help this initiative, Dan Ginsburg, Chief Operating Officer for SHC, announced this past week the appointment of Mr. Bruce Harrison as the Executive Director for the affiliate network currently in formation by LPCH, SHC and SOM. Mr. Harrison was previously Senior VP and Chief Administrative Officer for WellStar Physicians Group, a multi-specialty medical group with over 400 providers, 80 locations and 1.2 million annual visits in Marietta, Georgia. He also previously held administrative positions at Scripps Clinic and Research Foundation and UC San Diego Medical Center. He will be joining SHC on February 15th. As details about the community and affiliated network are further defined, I will communicate them to you in future newsletters.

Tuition Changes for Medical Students

More than a year ago, Dr. Charles Prober, Senior Associate Dean for Medical Education, appointed a “Tuition Committee” to consider restructuring the tuition program at the medical school. It was felt that the current structure, which comprises 13 quarters at full tuition and additional quarters at a reduced rate called TMR (Terminal Medical Registration), was too complex and didn’t compare easily to the tuition structure at other medical schools. TMR was originally put in place many years ago to encourage students to spend a fifth year doing supervised research at the school; however, it is confusing because the benefit of lower tuition does not come while the student is doing the research, but rather at the end of his or her clinical years. In addition, it falsely represents Stanford as one of the most expensive schools among our peers, since comparisons are calculated based on tuition in the first three quarters of attendance, which does not take into account the TMR savings that comes at the end of the MD journey at Stanford.

The Tuition Committee comprised staff from Educational Programs and Services, including Financial Aid, Admissions, and others; and over a dozen students. This group concluded that the structure should be changed to reflect the goals of greater simplicity and comparability by smoothing the tuition rate across all years, incorporating the lower TMR into all quarters. The resulting structure eliminates TMR and institutes a research rate, which (we hope) motivates students to stay for an additional year of research by matching the timing of a reduction in tuition with the research. The result is a tuition rate that is more than 5% lower than the expected rate in each of the first 13 quarters, saving students money in the initial years of their education. For students taking the additional year of research—which the vast majority of our students do—a combination of the low research rate plus Medical Scholars funding is expected to make that year free of cost, including covering a standard cost of living amount. The new tuition structure applies only to incoming students, beginning next fall (August 2010).

The AAMC reports tuition rates for medical schools according to the first three quarters of tuition, so these changes will more accurately represent Stanford’s cost relative to our peers in the thirteen-school consortium; rather than being viewed as the third most expensive school, after Washington University and Case Western, we are likely to be closer to the middle of the pack, nearer Harvard, Penn, and Duke. Over a full four-or five-year degree program the new structure costs slightly more than it would have under the current structure for a typical student. We believe that our position relative to peer institutions will remain positive, and we anticipate that our graduates will continue to have among the very lowest debt in the country.

To Be Shod or Not To Be Shod

Like many endurance athletes who read Christopher McDougal’s now popular book entitled Born to Run: A Hidden Tribe, Superathletes, I have been toying with the idea of whether to try to run barefoot instead of with my trusted Asics Nimbus 11. McDougal tells the story of the Tarahumara tribe in Mexico who run astounding distances on a daily basis with minimal injury. In addition to a fascinating story, the book takes on a theme that has become a sports cult passion; namely, that the introduction of cushioned running shoes in the 1970s – which have become more elaborate and cushioned since then – serve to promote more injury than they

prevent. Since I have been wearing various evolutions of these running shoes – indeed since the 1970’s – and have had my fair share of injuries, it is hard to not question whether things would be different in a non-shod state. Alternatively, I wonder whether I’d still be doing 50-70 miles per week (as I continue to do decades later) had I not had the advantage of modern running shoes.

The speculation offered by McDougall was intriguing but now takes a more significant twist with the publication by DE Lieberman et al of “Foot strike patterns and collision forces in habitually barefoot versus shod runners” in the January 28th issue of *Nature* (see: <http://www.nature.com/nature/journal/v463/n7280/pdf/nature08723.pdf>). Since these data fly in the face of all that we have been taught about running shoes (albeit largely through marketing) it will be interesting to see how these observations impact behavior – as well as future generations of running shoes. Given the number of runners among our faculty, students and staff I am confident this new report – and the blogs and hype around it – will provoke questions and debates and, I hope, some additional research.

It’s always fascinating to see how new data can upset prior “truths.” But as we all know, the half-life of most new knowledge is all too short.

Mini Med School Website Is Launched

As I have described in previous newsletters

(http://deansnewsletter.stanford.edu/archive/09_28_09.html#4, http://deansnewsletter.stanford.edu/archive/01_25_10.html#5), we are offering, in partnership with Stanford Continuing Studies Program, a three quarter mini med school course that was very well received by our community. The fall quarter is now available through Stanford iTunes at this web site: <http://med.stanford.edu/minimed/>. The winter quarter course currently in progress will be added early in the spring quarter, and the spring quarter will be added early in the summer. This is a great opportunity to see some of the school’s most distinguished faculty discuss their areas of expertise, and I am very pleased that we can make their presentations available to all.

Awards and Honors

- ***Branimir I. (Brandy) Sikic***, Professor of Medicine (Division of Oncology), Associate Director of the Cancer Center, and Director of the Clinical and Translational Research Unit, has been awarded the Presidential Medal for Science and Medicine from the President of Croatia, Stjepan Mesic. The Presidential Medal recognizes his achievements in cancer research, and his contributions to medical education and cancer care and prevention in Croatia. One of the key outcomes of a meeting between the Croatian government and the US National Institutes of Health in 2007 was a law banning cigarette smoking in public places throughout the country. Congratulations, Dr. Sikic.
- ***Sarah Geneser, PhD***, postdoctoral fellow in the Radiological Sciences Laboratory, was awarded a Dean's Postdoctoral Fellowship from the Stanford School of Medicine, to model the impact of hormone replacement therapy on breast cancer risk and progression to better understand the physiological effects on breast tumor development. She is working with Dr. Sylvia Plevritis to investigate the impact of mammography screening and treatment on breast cancer incidence and survival.

- **Hua Fan-Minogue, PhD**, Stanford Molecular Imaging Scholars Program (SMIS) Fellow in the Multimodality Molecular Imaging Lab, was awarded a Travel Fellowship from the Helena Anna Henzl Gabor Young Women in Science Fund to attend the American Association for Cancer Research (AACR) 101st Annual Meeting 2010.
- **Norbert Pelc, ScD**, professor of radiology and bioengineering, was elected to the position of Third Vice President of the Radiological Society of North America.
- **Rebecca Rakow-Penner, MD/PhD** candidate in biophysics and graduate student in the Radiological Sciences Laboratory, was selected as a finalist for the Young Investigators' W.S. Moore Award in clinical science. Finalists will be given the honor of presenting their papers at the upcoming Joint Annual Meeting of the International Society for Magnetic Resonance in Medicine-European Society for Magnetic Resonance in Medicine and Biology (ISMRM-ESMRMB), which will be held in Stockholm, Sweden, May 1-7, 2010.
- **Ying Ren, MD**, radiologist at Sheng Jing Hospital of China Medical University and postdoctoral scholar in the Translational Molecular Imaging Lab headed by Dr. Juergen Willmann, has received the 2010 Stanford Dean's Fellowship for her research proposal entitled "Evaluation of Activity and Remission of Inflammatory Bowel Disease by Molecular Targeted Microbubble-Enhanced Ultrasound in a Mouse Colitis Model."
- **Arne Vandenbroucke, PhD**, postdoctoral scholar in the Molecular Imaging Instrumentation Lab, received a three-year postdoctoral fellowship from the Department of Defense (DOD) Breast Cancer Research Program (BCRP) of the Office of the Congressionally Directed Medical Research Programs for his research proposal entitled "Commissioning and Characterization of a Dedicated High-Resolution Breast PET Camera."
- **David Wang, MD**, fourth-year radiology resident, has won two awards: a Radiological Sciences of North America (RSNA) Travel Award for Young Investigators in Molecular Imaging and a World Molecular Imaging Conference Travel Stipend. David received these awards for his research on gene therapy using ultrasound and custom-made microbubbles, which serve as carrier vehicles for therapeutic delivery.

Congratulations to all!

Appointments and Promotions

Marian M. Adams was promoted to Clinical Associate Professor of Pediatrics (Neonatal and Developmental Medicine), effective 1/01/10.

Cathy Angell was reappointed as Clinical Assistant Professor (Affiliated) of Pediatrics (Neonatal and Developmental Medicine), effective 1/01/10.

Scott D. Boyd was appointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 1/01/10.

Ian P. Brown was promoted to Clinical Assistant Professor of Surgery (Emergency Medicine), effective 12/01/09.

Jennifer L. Carlson was promoted to Clinical Assistant Professor of Pediatrics (Adolescent Medicine), effective 1/01/10.

Ian Carroll was appointed to Assistant Professor of Anesthesia at the Stanford University Medical Center, effective 1/01/10.

Lorinda Chung was reappointed to Assistant Professor of Medicine at the Veterans Affairs Palo Alto Health Care System, effective 1/01/10.

Rebecca E. Claure was reappointed as Clinical Assistant Professor of Anesthesia (Pediatric Anesthesia), effective 1/15/10.

Stanley Deresinski was appointed as Clinical Professor of Medicine (Infectious Diseases), effective 1/01/10.

Gundeep Dhillon was reappointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 1/01/10.

Chrysoula Dosiou was reappointed as Clinical Assistant Professor of Medicine (Endocrinology, Gerontology and Metabolism), effective 1/01/10.

Ram Duriseti was reappointed as Clinical Assistant Professor of Surgery (Emergency Medicine), effective 1/01/10.

Gary Fanton was reappointed as Clinical Professor of Orthopaedic Surgery, effective 12/01/09.

Howard H. Fenn was reappointed as Clinical Associate Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 9/01/09.

Karen J. Friday was reappointed as Clinical Professor (Affiliated) of Medicine (Cardiovascular Medicine), effective 1/01/10.

Kathleen Fujino was promoted to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/01/09.

Joyce Fu-Sung was appointed as Clinical Assistant Professor of Obstetrics and Gynecology (Maternal-Fetal Medicine), effective 7/01/10.

Gregory H. Gilbert was reappointed as Clinical Assistant Professor of Surgery (Emergency Medicine), effective 9/01/09.

Lucinda Hirahoka was appointed as Clinical Assistant Professor of Medicine (General Internal Medicine), effective 2/01/10.

William A. Jensen was reappointed as Clinical Professor (Affiliated) of Medicine (Pulmonary and Critical Care Medicine), effective 9/01/09.

Daniel T. Kato was reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/01/09.

Sandhya Kharbanda was appointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 1/01/10.

Carl M. Kirsch was reappointed as Clinical Professor (Affiliated) of Medicine (Respiratory and Critical Care Medicine), effective 9/01/09.

Birgit Maass was appointed as Clinical Assistant Professor of Anesthesia (Pediatric Anesthesia), effective 3/01/10.

Anthony Mascola was reappointed as Clinical Assistant Professor of Psychiatry and Behavioral Sciences (Behavioral Medicine), effective 9/01/09.

Mirna Mustapha was appointed to Assistant Professor of Otolaryngology , effective 2/01/10.

Sonya Misra was reappointed as Clinical Assistant Professor (Affiliated) of Pediatrics (Neonatal and Developmental Medicine), effective 1/01/10.

Jayakar Nayak was appointed to Assistant Professor of Otolaryngology – Head and Neck Surgery at the Stanford University Medical Center, effective 1/01/10.

Sachie Oshima was reappointed as Clinical Assistant Professor of Surgery (Emergency Medicine), effective 9/01/09.

Periklis Panousis was promoted to Clinical Assistant Professor of Anesthesia, effective 4/16/10.

Jeffrey S. Peterson was reappointed as Clinical Assistant Professor of Surgery (Emergency Medicine), effective 9/01/09.

Jennifer M. Phillips was promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences (Adolescent Psychiatry), effective 1/01/10.

Craig S. Rosen was promoted to Associate Professor of Psychiatry and Behavioral Sciences at the Veterans Affairs Palo Alto Health Care System, effective 1/01/10.

Josef I. Ruzek was appointed as Clinical Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 12/01/09.

Gaetano J. Scuderi was promoted to Clinical Assistant Professor of Orthopaedic Surgery, effective 1/01/10.

Jeannie L. Seybold was promoted to Clinical Assistant Professor of Anesthesia (Pediatric Anesthesia), effective 2/10/10.

John L. Tatman was reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/01/09.

Hyma T. Vempaty was appointed as Clinical Assistant Professor (Affiliated) of Medicine (Blood and Marrow Transplantation), effective 10/01/09.

Wen-Kai Weng was reappointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 1/01/10.

Thomas Wentzien was promoted to Clinical Associate Professor (Affiliated) of Medicine (Cardiology), effective 8/01/09.

Sarah R. Williams was reappointed as Clinical Assistant Professor of Surgery (Emergency Medicine), effective 9/01/09.

Steven T. Woolson was reappointed as Clinical Professor of Orthopaedic Surgery, effective 1/01/10.

Kristen Yeom was appointed to Assistant Professor of Radiology at the Lucile Packard Children's Hospital, effective 1/01/10.

Dean's Newsletter February 22, 2010

Transition in Leadership at Stanford Hospital & Clinics

Since the last edition of this newsletter, Martha Marsh, President and CEO of Stanford Hospital & Clinics (SHC), has announced her retirement. Ms. Marsh joined SHC on April 2, 2002 – a year to the day after I came to the Medical School as Dean in 2001. During the past almost eight years, she and I have worked extremely closely, and I have tremendous respect for her leadership, collegiality and friendship. I want to thank her for her many contributions to SHC, the medical school, university and community. It has been a privilege to work with her and her leadership team.

It is sometimes hard to remember how different things were in 2001-2002. We were in the immediate aftermath of the failed merger with UCSF, and the negative impact of the merger and de-merger on the morale, strategic direction and financial status of the medical center was profound and even palpable across the medical center and university. I certainly recognize that those who preceded us had worked diligently on behalf of the medical center and university through the tumultuous challenges that characterized American medicine during the 1990s. But the convergence of a multiplicity of external and internal forces and events threatened the future of Stanford Medicine at the dawn of the 21st century.

I surely do not believe or want to imply that the currently dramatically improved state of the medical center today is related solely to a small handful of individuals – in the hospital(s), school or university. But I do believe that the collaboration, coordination and shared efforts of our respective leadership teams – which extend to our clinical and basic science chairs, faculty, staff and students – have made a major difference for Stanford Medicine. As we begin 2010, we still face enormous challenges, but we are now on an incredibly stronger financial underpinning.

The widening gulf that existed between our basic science and clinical faculty has been breeched, and the tensions between the medical center and university largely repaired. SHC now stands as an exemplar of high quality patient care and a resource for innovation in clinical research. Despite the surprising commentaries from some members of the Palo Alto City Council, the Medical Center is increasingly respected and valued by our community locally and globally. I attribute many of these directional changes to Martha Marsh's leadership and our shared efforts.

A search is now beginning for the next CEO at Stanford Hospital. As is often the case, many in our community are stepping forth with their views, perceptions and recommendations about the type of leader needed and about whether our current organization optimizes our prospects for continued success. As I have written in the past, there are 132 academic health centers (AHCs) in the USA that are comprised of a medical school, teaching hospital and sometimes related professional schools (e.g., nursing, pharmacy, dentistry, public health). They include state and private schools and universities, together with teaching hospitals that either are owned by the university or are independent and connected to the medical school by various affiliation agreements.

Some of these AHCs are governed by a single leader (e.g., an executive vice-president to whom the dean and hospital CEOs report), and others (like Stanford) have separate leaders for the medical school and hospitals. The organizational and governance structure is often designed to optimize coordination and integration – and it recognizes the frequent tensions (often financial) that exist between a medical school and teaching hospital. These tensions are real and are certainly challenged by the economic forces impacting patient care, research and education. Understandably, the tensions are less when resources are abundant and become more challenging during times of constraint – like the ones we are facing now and will continue to face for many years to come.

I do not intend to argue for the primacy of any one model of governance, nor do I believe that any organizational structure assures success. In the end it comes down to the individuals in leadership roles and how willing they are to communicate, collaborate and compromise. I know of no governance or organizational structure that overcomes non-collaborative individuals, and I also believe that cooperative leaders can transcend even imperfect organizational models. Because we are distinctive among our peers in how we are organized, I was asked a few years ago to reflect on Stanford as a Case Study.

My opinion piece was published in **Academic Medicine** (2008;83 (9): 867-72). At the end of the article I listed 10 lessons learned (or at least ones I think I learned) during my time at Stanford. I think those lessons are relevant today and, in particular, are pertinent to questions of our future governance, organization and leadership. In that spirit, I repeat them here for your consideration:

(My) Lessons Learned

- Because AHCs are often highly matrixed by interdependent interactions and relationships between academic and clinical programs, they are also fragile and can be adversely affected when one mission gets off track or dominates the enterprise in an unhealthy way. This was true at Stanford Medicine when the merger with UCSF created distractions, financial losses, and distrust between the faculty in basic and clinical departments and between the AHC and university. To overcome these challenges, a transparent and thoughtfully articulated plan was essential.
- Overcoming a major disruption such as a failed merger requires a redefinition of the mission, goals, and objectives of both the medical school and the AHC. It requires buy in from multiple constituencies including the basic and clinical science faculty, students, and staff. It also requires healing among communities that had felt disenfranchised or even abandoned by an institutional direction they did not understand or support.
- Communication is a key component of institutional transformation, along with clearly delineated plans that are modified and adjusted to accommodate to the various institutional constituencies and their not infrequently differing perspectives. This requires communication from the leadership that is transparent, engaging, informative, and continuous.
- Institutional progress requires plans and objectives that are not only transparent but also achieved. Institutional ownership of the planning process and its deliverables is essential and should not be delegated to outside consultants or individuals who are not responsible and accountable.
- Transformational planning is a constant process with frequent ebbs and tides. Because of the diversity of talents, interests, and commitments at an AHC, it cannot be expected or anticipated that unanimity of opinion or support will be achieved. Difficult choices need to be made, priorities set, and accountability recognized. That said, progress is more possible when the institutional planning is adjusted to fit the culture, history, and values of the institution.
- Most AHCs have to make choices about their areas of focus and institutional priorities, because few are large enough to do everything. When there are internal or external constraints, forward planning is essential. Even if the plans are not fully achieved, they provide a foundation for future adaptation and modulation. During the past several years, the school's strategic plan, *Translating Discoveries*, has served as an anchor by which to align missions in education, research, and patient care.
- Understanding the inherent strengths and distinguishing features of an institution is also essential to successful planning. When Stanford's medical school began separating its functions and missions from its parent university, it lost the trust of the university faculty and became perceived as a liability rather than as an asset. Efforts to better integrate the medical school with the missions of the university (through the BioX program, the department of bioengineering, and the Institutes of Medicine) have helped to overcome some of the misperceptions and have led to positive interactions that appeal broadly to university leaders and the community.
- Leadership models at AHCs are highly varied, and none are necessarily sustainable over time. Stanford's separate leadership of its medical school and two major teaching hospitals provides both strengths and weaknesses. Whereas the overall mission has been served because of the positive interaction of current leaders, this model is not necessarily sustainable, and it could be compromised by resource constraints that pit one mission

against another or by changes in individuals that alter the dynamics or trust of the institutional leaders

- Having the trust and authority of the university president, provost, and board of trustees is essential, especially when major changes are contemplated or being implemented. But, this trust is also subject to change and, thus, must be constantly reinforced by evidence of progress. Objective external evaluation of this project on a regular basis serves to validate the plans and the leadership. But, it must be recognized that such external reviews can also result in changes in institutional direction or leadership as well—and, thus, this also must be anticipated.
- AHCs are likely to be especially challenged in the next decade, ironically because of the destabilization likely to occur from some of the forces that brought them into their current structure and function. For example, with the anticipated changes in Medicare and the reduced support for biomedical research from the NIH, the historically highly leveraged success of AHCs will be increasingly compromised.

Likely, new models will need to be developed to sustain core missions in research and education as well as patient care. These external forces make ongoing institutional planning essential; without such efforts, inadvertent damage can easily occur. As mentioned earlier, despite their formidable strengths, AHCs are also fragile, and without planning and leadership, they can lose their focus and, potentially, their preeminence, by an institutional direction they did not understand or support.

I am not certain how transportable these lessons will be to the future leaders of Stanford Medicine, but I do recognize that paying attention to history is an important way to avoiding future mistakes. That said, the future of the current organizational structure and governance of Stanford Medicine will rest heavily on the individuals who lead the school and the hospital in the years ahead. In that regard I hope that our recent past history will have an enduring value into the future.

Leadership Transitions in the School of Medicine

The complexity of medical schools also require continuity of leadership over time – often much longer than leadership roles within universities, businesses or foundations. At the same time, changes in leadership are important opportunities for renewal and recalibration accompanied by regular processes of evaluation and assessment. In the Medical School all institutional leaders (i.e., basic and clinical department chairs, institute directors and senior decanal positions) are time-limited appointments – generally 5 year terms, albeit renewable up to defined limits. Many senior leaders at Stanford also hold “at will” appointments, which means that they serve at the “pleasure of the president or the dean with the concurrence of the president.”

Transitions in medical school leadership are governed by tradition, policy, performance and personal career decisions. Conventionally, basic science chairs serve for single five-year terms and successors are chosen from within the department – often the associate chair assumes leadership for a five-year period. On occasion, some basic science chairs elect or are requested to serve a second term – but rarely if ever does chair service exceed 10 years. Clinical science chairs serve renewable 5- year terms with a maximum of 20 years. The School and University leadership believes that extensions beyond 20 years are not in the best long-term interests of departments or individuals.

The performance of department chairs and institutional leaders is evaluated annually with more detailed performance assessments occurring near the completion of a term. Even with outstanding performance it is valuable for institutions and individuals to be renewed at defined or not-to exceed intervals. While it is not mandatory, the convention at Stanford (and indeed for almost every medical school) is for clinical chairs to be selected by a national search. This permits institutions like Stanford to do all it can to engage the best leadership possible – and to also empower its clinical leaders through the search and selection process.

At the beginning of 2010 a number of clinical chairs positions are undergoing evaluation for potential reappointment. Others are under search (or soon will be) because the department chair has elected to step down or has reached the maximum duration limit. I hope to announce soon the new chair of the Department of Psychiatry and Behavioral Sciences, who will succeed Dr. Alan Schatzberg, who has served as chair so successfully for 19 years. I also expect to conclude the search for the next chair of the Department of Dermatology, given Dr. Al Lane's decision to step down as chair after 14 years of service. A search committee has recently been formed for the next chair of the Department of Radiology to succeed Dr. Gary Glazer, who has led with excellence (and by exception) for 22 years.

We hope to find Dr. Glazer's successor by the time he completes his final term at the end of August 2011. In addition, Dr. Richard Hoppe has informed me that he plans to step down as chair of Radiation Oncology at the completion of his current term in August 2011, and we will soon be appointing a search committee for his successor. Each of these leaders has performed in an outstanding manner and we all owe them our respect and gratitude.

In addition, a number of clinical chairs have recently or will soon be reappointed to a second term, including Drs. Bobby Robbins, Chair of Cardiothoracic Surgery; Rob Jackler, Chair of Otolaryngology/Head & Neck Surgery; Dr. Bill Maloney, Chair of Orthopaedic Surgery; Frank Longo, Chair of Neurology and Neurological Sciences; and Dr. Jonathan Berek, Chair of Obstetrics & Gynecology. Dr. Steve Galli, Chair of Pathology, has recently completed an evaluation after serving for two terms and will be reappointed to a third term. Two other clinical chairs, Dr. Ron Pearl (Anesthesia) and Linda Shortliffe (Urology), are currently undergoing our evaluation process for potential reappointment. These evaluations, which are conducted through our Office of Academic Affairs, gather input from within and outside the chair's department – a process that is helpful to the school and the individual.

Institutions like Stanford are built on individuals and leaders. I am deeply grateful to each of our leaders and also look forward to working closely with those who will join our leadership team in the future.

Appreciation for Stanford's Support to Haiti

The heartbreaking images of the tragic earthquake that struck Haiti just over a month ago still loom large in our minds. As is often the case, the media focused our attention intensely on Haiti in the first awful days and weeks following the earthquake, calling to our attention the hundreds of thousands of individuals who were killed or the millions who were injured or displaced by an earth-shattering event that took only tens of seconds to unleash its destructive forces. Also predictably, the media has now largely moved elsewhere and for many, the tragedy of Haiti

recedes into memory banks well versed in world tragedies. Except, of course, for the survivors, who are impacted every moment of every day by the ongoing consequences of the earthquake. Their memories are very much in the present.

Heroic teams (including those from the Stanford University Medical Center – see: <http://med.stanford.edu/ism/2010/february/haiti-follo-0208.html>), along with global relief organizations and the economic support from nations around the world, dealt remarkably and admirably in providing food, water, medical care and other resources in the immediate aftermath of the tragedy in Haiti. Most have now returned home. They carry with them indelible memories of experiences that transcend even the worst human suffering than nearly any of us can imagine.

However, the ongoing crisis requires continuing support – something that Dr. Michele Barry, Professor of Medicine and Senior Associate Dean for Global Health, immediately recognized when she helped stimulate the matching program that raised some \$370,000 from the Stanford community for the Hôpital Albert Schweitzer (HAS) in Haiti. I have previously extended my own appreciation to the Stanford community for its contributions. I would now like to share a message of appreciation that Dr. Barry recently received from Dr. Ian Rawson, the Medical Director of HAS.

Dear Michele,

What a wonderful out pouring of concern and support you have encouraged from Palo Alto! This has inspired us - the demands on HAS have been enormous, and I continue to be awed by the response from everyone here at the hospital. Almost every employee has been affected directly by the quake - family members who have died or been displaced, and others who have come out from the capital to live in their lacours. And then they face the challenge of caring for patients with devastating injuries.

Our major challenge now is the social and health concerns of the more than 20,000 internally displaced persons who have come out to the Valley, all of whom need immunizations, primary care, food and jobs. The UN agencies look to us, as the major NGO in this region, to develop programs on their behalf. Our field staff has registered all of the IDPs in our electronic medical record system, so we can find them and fold them in to our support programs.

These are new challenges for HAS, and we would not have the strength or courage to take them on without the support from all of you at Stanford. Mere thanks do not suffice...

For some reason, I was not able to "copy all" on this message so I would appreciate it if you could forward this to your original addressees.

Best wishes,

Ian

If you are interested in learning more from the first experiences of the Stanford Medicine teams that provided medical care in Haiti, I call your attention to two upcoming presentations:

1. **Dr. Paul Auerbach**, Professor of Surgery (Emergency Medicine), will speak at the Department of Medicine's Grand Rounds on Wednesday March 31st at 8 am in the Braun Auditorium
2. **Dr. Robert Norris, Professor of Surgery (Emergency Medicine) and the ED Team** will share their experience at an event sponsored by Martha Marsh (SHC), Chris Dawes

(LPCH) and myself (SoM) at 5:30 pm on Thursday April 1st – also in the Braun Auditorium. [Download Flyer](#)

The Interface between Patient Care, Innovation and Research

One of Stanford's most distinguishing hallmarks is the spirit of innovation and discovery that permeates our institution. New insights can result from methodical experimentation or be triggered by a new or unanticipated observation. While we generally think about the “ah-ha” moment in relation to basic fundamental research, such insights can also emerge from an observation at the bedside – as the result of a procedure, device or medication (e.g., an “off-label use of drug or biological or a variation on an operative technique). In some cases these are extensions of standard patient care, but on occasion the lines between innovative patient care and research can get blurry, and sometimes the line can be crossed – often inadvertently, although with consequences.

Because we want to foster innovation in research and patient care as well as the safety and protection of individuals as “human subjects,” we have recently appointed a task force to examine the broad issue of innovation and patient care. More specifically, this group is charged with creating a system that would determine when innovations in patient care should be defined as research and, as such, protected by institutional review and oversight. This task force is being coordinated between Stanford Hospital & Clinics and the School of Medicine and is being led by Dr. Geoff Rubin, Professor of Radiology and Associate Dean for Clinical Affairs.

At least at one level, clinical innovation in patient care crosses over into “research” whenever it involves: the prospective intent to create new knowledge; a systematic approach to the selection, treatment and/or follow-up of patients (or subjects); outcomes measurement; and the potential or prospect for reporting the data publicly – in peer reviewed or other publication. When one or more of these conditions exist, the patient care should be formalized in a clinical protocol that is reviewed and approved by the Institutional Review Board (IRB).

The work of the task force is just beginning and will seek broad input. At its initial meeting, the task force enumerated five factors they deemed essential to an effective system that could distinguish patient care from clinical research – and especially activities that should be conducted under the umbrella of the IRB. These include:

- Identifying procedures, therapeutic approaches, diagnostic tests, and preventions that either are or should be research
- Confirming through peer review that the identified clinical activity fulfills the requirements for management under this process
- Assuring that clinical activities are discontinued until an IRB approved protocol can be instituted and then only occur under that protocol
- Assessing the results of the trial to determine if/when the investigational care may transition to routine clinical care
- Recommending criteria for privileging physicians to provide the new “clinical innovation”

The group recognizes the importance of getting input from various clinical leaders as well as those with regulatory experience and oversight. Drawing on the experience of other academic centers and available reports (e.g., <http://healthcare.partners.org/phsirb/inntherp.htm>) will also be part of the process. At least as a start, the group identified some conditions that might trigger a determination of when clinical innovation is migrating to research and the need for IRB review and approval. These might include:

- The number of subjects who have undergone or expect to be undergoing the procedure/test
- A determination of whether reasonable physicians differ on the appropriateness of the care
- The likelihood that the innovation could cause harm versus benefit
- Whether the application of the innovation sufficiently prevalent that it can be studied
- The details of the Belmont Report (<http://ohsr.od.nih.gov/guidelines/belmont.html#goa>)

Clearly this is an important topic and one for which the committee is interested in comments and recommendations. If you would like to offer opinions, perspective or guidance please contact Dr. Geoff Rubin.

The Coulter Program – a Model for Seed Grants

At the February 19th Executive Committee, Dr. Russ Altman, Professor and Chair of the Department of Bioengineering, gave an update on the highly successful Stanford-Coulter Translational Research Grants Program. As noted on the website, the Stanford Coulter Program “funds projects proposed by multi-disciplinary teams of biomedical engineers and clinical scientists. The devices, diagnostic procedures and treatments that result from the work of these teams are intended to result in patents, spawn start-up biomedical companies and/or be transferred through licensing agreements to existing companies. The Stanford-Coulter program also seeks to raise awareness—on campus and beyond—of the importance of translational research through multi-disciplinary collaboration. Every aspect of the program is designed to increase, enhance and accelerate this process.”

Dr. Altman gave amazing examples of proposals that this program has supported over the past several years, many resulting in major scientific papers, new products or companies or tremendous leveraging for competitive sponsored research funding. Virtually every proposal has included faculty members from the School of Medicine and Bioengineering. If you are interested in learning more about this program see: <http://bioengineering.stanford.edu/coulter/aboutus.html>.

I hasten to add that the Stanford-Coulter program is joined by a number of other seed grant programs sponsored by the Medical School or University (e.g., BioX programs, Stanford Institute of Medicine Seed Grant Programs, Children’s Health Research funding, Beckman Center Interdisciplinary Translational Research Program, etc). These programs share in common their support for novel and innovative research and the prospect for bringing new teams of faculty together to engage in research that might not otherwise have happened. They all boast a tremendous leveraging effect as well. That said, these programs require considerable institutional

commitment and it is timely that we review them more comprehensively to demonstrate their presumed impact and success.

Phishing at Stanford

I assume you have similar experiences to mine. Every so often I get an email request that looks real and asks for a response. The latest had to do with my email storage being fully occupied – which made some sense since I file most emails. Thankfully, rather than responding to the query I checked with our Information & Resources Technology (IRT) support and learned that the messages I was receiving was phishing – and trying to induce me to provide information (which thankfully I didn't do and about which I try to stay vigilant). That said, it can be confusing. Accordingly I share the following advice message to all of you that comes from Ellen Amsel, Information Security Officer and Director of Information Security Services in the School of Medicine's IRT.

Emails have been circulating through the Stanford email system asking for your SunetID (userID) and password.

Stanford will NEVER ask you for this type of information, and it is important that you not provide it, EVER.

These emails are actually attempts (known as phishing) to get you to divulge your password so that the sender of the request can gain unauthorized access to your email and other computer accounts.

If you have erroneously responded to such an email with your SunetID and password, please contact us immediately (IRT Information Security Services or Ellen Amsel) so that we can assist you.

If you have a question regarding email that you receive, you are encouraged to contact IRT Information Security Services about this and we will respond promptly.

Please remember to safeguard your SunetID and password and not divulge it to anyone, even if the email appears legitimate.

Please pay careful attention to solicitations and if you have any questions contact our security service.

Malcolm Gladwell and Medicine and the Muse

Dr. Audrey Shafer asked me to share the great news that **Malcolm Gladwell** (author of ***The Tipping Point, Blink, Outliers, What the Dog Saw***) will be this year's speaker at the Medicine and the Muse Symposium on Thursday, April 8th at 5 pm. Of note this event will also feature presentations, music and exhibits by Stanford Medical Students. Also, it will be held in the new Conference Center in the Li Ka Shing Learning & Knowledge Center – perhaps the first major event in this wonderful facility. The Symposium is free and open to the public. If you have any questions contact Paula Bailey.

Postdoctoral Fellowship Awards

The Office of Postdoctoral Affairs invites applications for the Spring 2010 cycle of the Dean's Postdoctoral Fellowships. The Dean's Fellowships were established to support the advancement of postdoctoral research training under a mentorship of a faculty member at the School of Medicine, through awards to current and prospective postdocs. Preference is given to junior postdocs and junior faculty mentors.

The Fellowships are often used as seed money while outside funds are sought. Awards are made in the form of a stipend directly to the postdoctoral fellow, up to \$20,000 per year for one year. Spring awards start in July 2010 through June 2011. A second year may be awarded on a competitive basis. Proposals should be submitted electronically online in addition to a paper submission to Teri Hanks in the Office of Postdoctoral Affairs by 12 noon, Tuesday, March 16, 2010. Further information can be obtained

at: http://postdocs.stanford.edu/scholars/fellowships_dean.html

Awards and Honors

- **Dr. Harry Greenberg**, Joseph D. Grant Professor in the Department of Medicine and Microbiology & Immunology and Senior Associate Dean for Research, will be a recipient of the American Liver Foundation's Salute to Excellence Award "honoring those have made outstanding contribution to technology and medical innovation." A celebratory event will be held in San Francisco on Saturday March 13th. Please join me in congratulating Dr. Greenberg.

Dean's Newsletter March 8, 2010

Dr. Laura Roberts Named Next Chair of Psychiatry

I am very pleased to announce that Dr. Laura Roberts will join Stanford in September 2010 as the next Chair of Psychiatry, succeeding Dr. Alan Schatzberg, who has served as Chair since July 1991. During Dr. Schatzberg's 19-year tenure, the department has grown in size, scope and depth and is widely recognized as one of the very best academic departments of psychiatry in the nation. We owe a deep debt of gratitude to Dr. Schatzberg for his leadership. We learned from virtually every prospective candidate that their interest in Stanford was related to the excellence of the University and School and to the fact that the department has such outstanding faculty, students and trainees. The Search Committee, which was chaired by Dr. Heidi Feldman, the Ballinger-Swindells Professor of Developmental and Behavioral Pediatrics, did a spectacular job in indentifying an outstanding group of leaders, many of whom are sitting department chairs, as candidates for this important position.

Dr. Roberts is currently the Charles E. Kubly Professor of Psychiatry and Behavioral Medicine and Chair of the Department of Psychiatry at the Medical College of Wisconsin (MCW), a position she has held since 2003. She received her undergraduate, Masters and MD degree from

the University of Chicago. She trained in Clinical Medical Ethics at the University of Chicago and the pursued training in psychiatry at the University of New Mexico, including a Fellowship in Child and Adolescent Psychiatry. She rose rapidly through the academic ranks at the University of New Mexico, where she became Professor of Psychiatry and Director of the Institute for Ethics before moving to MCW.

Dr. Roberts is highly respected by her basic and clinical science colleagues at MCW as well as by leaders in psychiatry across the nation. She has received numerous awards including being named Distinguished Life Fellow by the Association for Academic Psychiatry and the Distinguished Psychiatrist Award from the American Psychiatric Association. She is a Fellow of the American Psychiatric Association, the American Society of Psychosomatic Medicine and the American Psychopathological Association. She has also held numerous leadership positions in national and international organizations along with significant leadership roles in academia. Her research has focused on the intersections of ethics, mental illness, education and training and research. She is the author of 117 peer-reviewed publications and numerous book chapters and reviews and the editor or co-editor of 8 books.

The Search Committee, as part of its work, identified a number of important attributes for the Chair of Psychiatry at Stanford, including evidence of effective leadership, commitment to clinical vision, high quality respected research, commitment to teaching and mentoring, a clear and inspiring vision for the future of psychiatry and strong interpersonal skills. I am pleased to say that the finalists the Committee identified excelled in many of these criteria, and Dr. Roberts was viewed as clearly superior in her leadership and interpersonal skills, among many other outstanding attributes. I have had the opportunity to interact with her in numerous settings over the past several months and have sought and received evaluations and opinions from national leaders as well as members of the Stanford community. These were outstanding and made her choice as the Chair an exciting prospect. I am extremely pleased that she has now accepted our offer and will be joining Stanford in September. She will be accompanied to Stanford by her family, including five children.

In addition to again thanking Dr. Schatzberg for his outstanding contributions as a faculty member and Department Chair, I also want to thank Dr. Heidi Feldman for her excellent work as the chair of the Search Committee. She was joined by Linda Boxer, MD, PhD, Professor, Department of Medicine, Chief, Division of Hematology; Michele Calos, PhD, Professor, Department of Genetics; Nancy Fischbein, MD, Associate Professor, Department of Radiology; Chantal Forfota, Medical Student; Stephen Galli, MD, Professor and Chair, Department of Pathology; Rona Giffard, MD, PhD, Professor and Vice-Chair of Research, Department of Anesthesia; Ian Gotlib, PhD, Professor, Department of Psychology, Senior Associate Dean of the Social Sciences, School of Humanities & Sciences; Al Lane, MD, Professor and Chair, Department of Dermatology; Nancy Lee, Vice President, Clinical Operations, SHC; Frank Longo, MD, PhD, Professor and Chair, Department of Neurology & Neurological Sciences; James McCaughey, Chief Strategy Officer, LPCH; Lorene Nelson, PhD, Associate Professor, Department of Health Research and Policy, Chief, Division of Epidemiology; Mary Ann Norfleet, MD, Emeritus (Clinical) Professor, Dept of Psychiatry & Behavioral Sciences; Carla Shatz, PhD, Professor, Department of Biology and of Neurobiology, Director, Bio-X Program; Marcia Stefanick, PhD, Professor (Research), Department of Medicine and Gary Steinberg, MD,

PhD, Professor and Chair, Department of Neurosurgery, Director, Institute for Neuroinnovation and Translational Neurosciences.

Finally I want to thank Ms. Kendra Baldwin for the exceptional work she has done in staffing our leadership searches and for the tremendous support we receive from the Office of Institutional Planning. As I have often stated, what makes institutions great is the quality of the individuals who join them. We are so very fortunate to have such a great community of excellence in psychiatry, and I am thrilled to welcome Dr. Laura Roberts to be the next leader of this important department.

Students Thank Donors for Their Financial Support

On Wednesday evening, March 3rd we hosted our annual Medical Education Donor Appreciation Dinner. This annual event celebrates the incredible contributions our donor community has made to support the Med Scholars and financial aid programs for Stanford Medical Students. Thanks to the remarkable efforts of our donors Stanford students graduate with the lowest amount of debt of any medical school in the USA – whether private or public. The financial aid our students receive enables them to pursue their ambitions and dreams in ways that are much less encumbered by the financial constraints that impact students in virtually every other school of medicine. Currently 9% of our \$1.676 million endowment and 2% of our \$473.6 million expendable reserves are used to support financial aid for medical and graduate students. It likely goes without saying that the current endowment funds are down by 26.4% compared to 2008, prior to the economic meltdown.

What makes the Donor Appreciation Dinner so special is that students receiving financial aid join donors for the dinner discussion. This brings face to face, often in a highly personal way, the donors and the students who are directly benefiting from their contributions.. Their shared stories and interactions help each to understand the impact of the funding being given or received. It's a powerful fusion of commitment, interests and gratitude.

While each donor and every student has a compelling personal story, we have the tradition of sharing more publicly a few individual journeys. This year Dr. Charles Prober, Senior Associate Dean for Medical Student Education, led a panel discussion that included four students: Krishnan Subrahmanian, SMS 2, Luis Gutierrez, SMS 3, Elsie Gyang, SMS 4, Juno Obedin-Maliver, SMS 5. They each come from very different backgrounds and life experiences but share in common their incredible accomplishments and the fact that, for each of them, the financial aid they are receiving has enabled them to attend Stanford and pursue their dreams.

Graduate Admissions Interview Week

March 4-6 was Graduate Student Interview Weekend. Each year our thirteen Bioscience PhD graduate programs, which are shared between the Schools of Medicine and Humanities & Sciences, invite the top ranked graduate student applicants to Stanford to interview with one or more departments and to meet and interact with students and faculty. This year 291 students (out of the 1,556 applicants) visited campus to explore their opportunities at Stanford and, of course, to be interviewed by the faculty before the final selections are made.. We are extremely fortunate

to have outstanding PhD students in the Bioscience Programs, and, in speaking with various department chairs and program directors. I was very pleased to hear that they felt this year's candidates were quite spectacular. Invitations for admission will be sent shortly and final selections made by March 12.

New Center for Cancer Systems Biology

Sylvia Plevritis, Ph.D., Associate Professor of Radiology, was informed this past week that she will lead one of the National Cancer Institute's eleven new Centers for Cancer Systems Biology. The theme of Dr. Plevritis proposal is "Modeling the Role of Differentiation in Cancer Progression." In the press release announcing Stanford University's new center, Dan Gallahan, program director for the Integrative Cancer Biology Program commented, "These centers represent a unique multidisciplinary union of outstanding scientists and clinicians who will work to unravel the complexities of cancer through the novel application of technology and mathematical modeling. Their discoveries and models will be critical to our continued success in understanding and treating this disease". This is terrific news for Stanford and the faculty who contributed to this important proposal. Please join me in congratulating Dr. Plevritis and her team for this wonderful success.

***Stanford Medicine* Focuses on Issues in Child Health**

Stanford Medicine, the Medical School's major institutional publication, has won award after award for its excellence in covering major themes in science and medicine. The Spring 2010 issue of *Stanford Medicine* has just been released and explores important challenges impacting child health. Rosanne Spector, editor of *Stanford Medicine*, joined forces with colleagues at the Lucile Packard Children's Hospital to put together this latest issue which is accessible on-line at: stanmed.stanford.edu/2010spring/

Our Office of Communication and Public Affairs has done a powerful job in helping Stanford to play a leading role among academic medical centers in reporting and covering major issues in the biosciences. Thanks to all who contributed to this issue of *Stanford Medicine*, which continues this record of accomplishment in such an excellent way.

Awards for Continuing Medical Education

I have written frequently about the significant concerns for conflicts of interest resulting from directed support from industry for continuing medical education (see: http://deansnewsletter.stanford.edu/archive/09_14_09.html#4). These concerns led to our Stanford University School of Medicine Policy on Commercial Support for Continuing Medical Education (CME) that went into effect in October 2008 and which was revised in July 2009 (see: http://cme.stanford.edu/documents/Comm_Support_7.09.pdf). Importantly, our policies did not eliminate all industry support for CME but restricted it to funding through the Office of CME and not through departmental or course specific programs.

In January 2010 Dr. Rob Jackler, Associate Dean for CME and Professor and Chair of Otolaryngology, was the recipient of a \$3 million gift from Pfizer to "design and implement a novel curriculum that uses a variety of advanced technologies and teaching methods, including

simulated and immersive learning tools” (see: <http://med.stanford.edu/ism/2010/january/cme.html>). Importantly, the Pfizer gift came with no strings or conditions and the company is not involved in the selection of the projects to receive funding. Dr. Jackler has informed me that the Selection Committee has now determined the projects that will receive support during this first year of funding. They include the following:

- Training Physicians to Become Better Communicators: A Study on the Implementation of a Skill-Based Communication Curriculum. *Sanjeev Dutta, Department of Surgery*
- Heart Failure Readmission Metric Based Quality Improvement. *Michael B. Fowler, Paul Wang, Department of Medicine*
- Surgical Quality, Best Practice and Innovation. *Paul M. Maggio, James Lau, Jeffrey A. Norton, Department of Surgery*
- Reengaging Practicing Physicians in the Diagnostic Utility of the Physical Examination. *Abraham Verghese, Department of Medicine*
- Stanford Center for Simulated and Immerse Learning. *David Gaba, Department of Anesthesia*
- Stanford Professional Development, Kelly Skeff, Department of Medicine
- Improving the care of atopic dermatitis by pediatric primary care providers. *Anna L. Bruckner, Department of Otolaryngology*
- An Evidence-Based PI-CME Program to Enhance Cultural And Linguistic Competence Among Practicing Physicians. *Clarence H. Braddock III, Department of Medicine*
- Evaluation and Management of Childhood Obesity. *Thomas N. Robinson, Department of Pediatrics*
- Stanford Palliation Education Network Competency based Communication Training and Evaluation (SPCCTE). *VJ Periyakoil, Department of Medicine*
- Outcomes-based Continuing Medical Education at CAPE. *Lou Halamek, Department of Pediatrics*
- A Study of Simulation for Training Perioperative and Procedural Patient Safety. *Sanjeev Dutta, Department of Surgery*
- A hands on primer to upper extremity problems. *Catherine Curtin, Jeff Yao, Department of Orthopaedic Surgery*

The 2010 Faculty Fellows Program

One of our most successful opportunities for leadership development and community building is the Faculty Fellows Program that was initiated by Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership (see: <http://med.stanford.edu/diversity/leaders/fellows.html>). I noted in the January 25th Newsletter the 2009 graduates of the program (http://deansnewsletter.stanford.edu/archive/01_25_10.html#3). On February 22nd I had the opportunity to meet with the 2010 Faculty Fellows for one of their first “leadership journey presentations.” I am thrilled to see another group entering into this program. As in the previous iterations of the program, the Faculty Fellows will interact with each other and in small groups with their assigned mentor. I note below this year’s Mentors and the Faculty Fellows who are assigned to each:

- Dr. Chirsty Sandborg (Mentor), Professor of Pediatrics and Chief of Staff, Lucile Packard Children’s Hospital:
 - Faculty Fellows
 - Dr. Emilie Cheung, Department of Orthopaedic Surgery
 - Dr. Maarten Lansberg, Department of Neurology
 - Dr. Amin Al-Ahmad, Department of Medicine
 - Dr. Jason, Lee, Department of Surgery
- Dr. Phil Lavori (Mentor): Professor and Chair, Health Research & Policy
 - Faculty Fellows
 - Dr. Anna Penn, Department of Pediatrics
 - Dr. Hayley Gans, Department of Pediatrics
 - Dr. Robert Dodd, Department of Neurosurgery
 - Dr. Matthew Strehlow, Department of Surgery
- Dr. Heidi Feldman (Mentor), Professor Pediatrics
 - Faculty Fellows
 - Dr. Merritt Maduke, Department of Molecular and Cellular Physiology
 - Dr. Chris Longhurst, Department of Pediatrics
 - Dr. Alan Cheng, Department of Otolaryngology
 - Dr. Lu Tian, Department of Health Research and Policy
- Dr. David Stevenson (Mentor), Vice Dean and Senior Associate Dean for Academic Affairs, Professor of Pediatrics
 - Faculty Fellows
 - Dr. Neeraja Kambham, Department of Pathology
 - Dr. Eliza Chakravarty, Department of Medicine
 - Dr. Karen Parker, Department of Psychiatry
 - Dr. Jonathan Kim, Department of Ophthalmology

Congratulations to the 2010 Faculty Fellows and special thanks to this years mentors and, of course, to Dr. Valantine and the Office of Diversity and Leadership.

Upcoming Events: Stanley Cohen Lecture

Lecture: Stanford Geneticist Stanley N. Cohen

Wednesday, March 10, 7:30 pm

Cubberley Auditorium (<http://www.stanford.edu/dept/HPS/CubberleyDirections.html>)

*Sponsored by the Continuing Studies Program and the Historical Society
Free; open to the general public, with no registration required*

Dr. Cohen co-invented the technique of DNA cloning that allowed genes to be transplanted between different biological species and then propagated in their recombined state. This accomplishment earned Dr. Cohen a National Medal of Science, a National Medal of Technology, and membership in the National Inventors Hall of Fame.

Please join us to learn about Stan Cohen's life and his chance encounter with Herb Boyer that launched a research project so important it resulted in creation of an entire new industry. Hear him talk about the international controversy caused by their discovery that led to a new way of life scientists interacting with the public, the press, legislators, and industry. Learn about his views on the future of biotechnology and new directions his research is taking him.

The evening will begin with a presentation by Dr. Lucy Shapiro, Stanford Professor of Cancer Research, about the scientific contributions of Dr. Cohen and their significance for the world. Then Dr. Cohen will be interviewed on stage, followed by a question and answer session with the audience. This is your chance to engage with one of the most consequential scientists of our time.

Three New Paul and Daisy Soros Fellowships for New Americans

The Paul and Daisy Soros Fellowships for New Americans have been awarded to 30 "creative and accomplished young immigrants or children of immigrants" in the 2010 competition. The 2010 Fellows were selected from 890 applicants from 297 undergraduate and 140 graduate institutions. I am proud to let you know that three Stanford Medical Students are among the 30 new fellows. Each two-year award provides cash grants of up to \$50,000 and tuition support of up to \$40,000. The three Stanford Medical School winning a Paul & Daisy Fellowship for 2010 are:

- ***Abdul Rasheed Alabi*** (SMS3), born in Pittsburgh, did his undergraduate work at Knox College. His family resides in Ilorin, Kwara State of Nigeria.
- ***Shah Ali*** (SMS2), born in Pakistan and whose family resides in Jersey City, NJ. He was an undergraduate at Rutgers University.
- ***Bowen Jian*** (SMS1) was born in China and was an undergraduate at Stanford. His family lives in Gaithersburg, Maryland.

These three new Soros Fellows join the 31 others awarded to Stanford Medical Students since this program began. Notably, Stanford has the second highest number of Soros Fellows (34) to Harvard at 54.

Please join me in congratulating our three new Soros Fellows and in thanking the Foundation for this wonderful support.

Awards and Honors

- Stanford's Medical School's SCOPE blog has just won **Best New Medical Weblog of 2009** awarded by Medgadget. Edited by the school's staff writers, SCOPE (<http://scopeblog.stanford.edu/>) covers medical news with a slightly academic angle, laced with a bit of opinion from a savvy group. Congratulations to the writers!
- **Dr. Natalie Rasgon**, Professor of Psychiatry and Behavioral Sciences will be receiving the Lila A. Wallis Award from American Medical Women's Association.

Appointments and Promotions

Susan Anderson has been promoted to Adjunct Clinical Associate Professor of Medicine effective 9/01/09.

Peter Chiu has been promoted to Adjunct Clinical Professor of Medicine, effective 9/01/09.

David Karpf has been promoted to Adjunct Clinical Professor of Medicine, effective 9/01/09.

R. Elaine Lambert has been promoted to Adjunct Clinical Professor of Medicine, effective 9/01/09.

Dean's Newsletter March 22, 2010

A Beginning for Health Care Reform

Sunday, March 21st witnessed a historic vote in the Congress for healthcare reform. While a couple of months ago I personally felt that the current legislation fell short of expectations, the prospect of no progress at all was more than daunting. Thus, I am happy to see at least a beginning of healthcare reform underway. I am also pleased that a number of physician groups offered their support for the House Reconciliation Bill. Of particular note, this past week the Association of American Medical Colleges (I am on the Board of Directors for the AAMC) formally offered its support for the healthcare reform legislation. So too did the Association of Academic Health Centers (I am the Chair of its Board of Directors). I am pleased that our academic enterprise formally expressed support even though I am well aware that individual members have varying concerns about the current legislation. But it is a beginning, although with lots more to do before we get to the end. At least that is something to be grateful for!

Match Day Results 2010

On Thursday, March 18th 93 medical students who will graduate this June received the news of their "Match" from the National Residency Matching Program (NRMP). Each year medical students planning to begin their residency submit their ranked list of choices to the NRMP. Similarly, residency programs provide their ranked list of selected applicants to the NRMP. Using an algorithm that favors student choice, the "Match List" is generated and announced to students and programs at the same time (corrected for time zone) around the world. Our students received their "Match" results at 10 a.m. in a ceremony held in our new Li Ka Shing Center for

Learning and Knowledge (LKSC). It is wonderful that this was the first official function held in the LKSC – which will not fully open until this summer.

This year some 16,000 students graduating from allopathic schools in the United States applied to the NRMP to participate in the 2010 Match. In addition, 10,941 students and graduates of international medical schools participated in the Match. Also, 2,045 graduates of osteopathic schools and 1,356 previously graduated MDs also participated, bringing the total number of match applicants to 30,543. The number of available positions included 22,809 residency slots and 2,711 second year residency positions.

Overall, Internal Medicine and Pediatrics saw increases in the number of positions filled by US medical school applicants. As in past years, some residencies continue to be among the most competitive, including Neurological Surgery, Orthopaedic Surgery, Dermatology and Otolaryngology. Of our 93 participating students, approximately 40% are graduating after 4 years of medical school, 40% will have done 5 years, and the remainder six or more years (most of these doing combined degree programs). Eight areas of residency training account for 67% of our graduates. These include Pediatrics (14 students, although 2 will pursue Pediatric Neurology), Internal Medicine (12 students), Dermatology (7 students), Orthopaedic Surgery (7 students), Radiology (6 students), Ophthalmology (6 students), Psychiatry (5 students) and Emergency Medicine (5 students). Three students each Matched in Obstetrics/Gynecology, General Surgery, Anesthesiology, Otolaryngology, Neurology, Neurosurgery or Pathology. Two students each Matched in Radiation Oncology, Family Medicine or Plastic Surgery. And one student each Matched in Urology or Physical Medicine and Rehabilitation.

Nine programs were Matches for two or more of our students: 23 Matched at a Stanford Program, 15 in a Harvard program (the MGH, Brigham & Women, Children's Boston, Beth Israel-Deaconess), 7 at Johns Hopkins, 7 at UCSF, 4 at Columbia/Cornell programs, 3 at U Penn, 3 at UCSD, 2 at UCLA and 2 at U. Washington. All told, roughly 75% of our 2010 graduates will be in either California or Massachusetts!

With that broad overview, here is the 2010 Match List:

**Stanford University School of Medicine
2010 Residency Match Results**

<i>Agulnik, Asya</i>	Childrens Hosp Boston-MA	Peds-Primary/BMC
<i>Aillaud Manzanera, Marissa</i>	Stanford Univ Progs-CA	Pediatrics
<i>Airan, Raag Dar</i>	Washington Hosp Ctr-DC	Medicine-Preliminary
	Johns Hopkins Hosp-MD	Rad-Diag/Research

	Massachusetts Gen Hosp-MA	Radiology-Diagnostic

Thanks to the support of the Stanford University Medical Center Alumni Association, we had an opportunity to congratulate our Stanford students and their families and friends who were able to attend at the Fifteenth Annual Match Day Celebration at the Faculty Club. Please join me in congratulating each of our students. I also want to thank the faculty and staff who have taught, guided, advised, mentored and supported our students along their journey. Becoming a physician is a long road, and graduation from medical school and the Match are just a couple of punctuation marks along the way. But they are incredibly important milestones and our students have performed in an outstanding fashion. I am proud of each of them and grateful to all of you for helping to make their dreams come true.

In addition to welcoming our Stanford medical students who participated in the Match, I am also very pleased that we will soon be welcoming outstanding students from around the nation who have matched in residency programs at Stanford Hospital and the Lucile Packard Children's Hospital. They too will be part of our Stanford community and will contribute to care of our patients and the education and training of our students and community.

Match Day is deeply etched in the minds of everyone who has graduated from medical school and participated in the Match. I recall my own Match Day and the new paths it opened. I wish all of our students and incoming residents the very best of success and happiness in their future careers in medicine.

National Advisory Council (NAC) Review 2010

On Monday, March 8th the School of Medicine's National Advisory Council (NAC) visited Stanford to review the School's overall progress and offer their advice and guidance about the School to the President and Provost. The NAC is chaired by Dr. Ed Benz, President of the Dana Farber Cancer Institute/Harvard Medical School and includes Drs. Elizabeth Blackburn (UCSF), Tom Boat (Cincinnati Children's Hospital), Ying-Ying Goh (SU Board of Trustees), Jennifer Grandis (University of Pittsburgh), Dan Lowenstein (UCSF), Trudy Mackay (North Carolina State University), Jim Madara (University of Chicago), David Nichols (Johns Hopkins), Arthur Rubenstein (University of Pennsylvania), Bill Stead (Vanderbilt), Mike Zinner (Brigham & Women's Hospital/Harvard Medical School) as well as Mariann Byerwalter (SU Board of Trustees) and Mary Cranston (SU Board of Trustees).

The visit began with my overall update of the significant events that have impacted the School during the past year. Needless to say, 2009 was a very challenging year due the economic meltdown that reached a peak (well, really a nadir) just a year ago. As I have recounted in prior newsletters (http://deansnewsletter.stanford.edu/archive/12_14_09.html), the University's endowment fell by 26.4% by the close of FY09 (August 31, 2009). For the School this meant a \$604 million loss in its endowment, which declined to \$1.676 billion. While this is certainly a significant decline, our endowment remains the second largest medical school endowment in the nation. Importantly, the endowment is coupled with current expendable reserve balances of \$473.6 million – nearly two thirds of which reside in department or faculty accounts. Looked at another way, even though 2009 brought significant challenges, the school and departments (particularly the clinical departments) still have a healthy, even if a highly restricted cushion.

In fact, we ended FY09 with a \$34 million consolidated surplus (which includes central administration, departments and institutes), although achieving this required considerable sacrifice. This included layoffs, a hiring freeze on staff and faculty (especially where a defined revenue stream was lacking) as well as an approximately 15% reduction in central administrative costs. Fewer reductions were passed on to departments but everyone shared in the challenge. We were also slightly buffered by increases in clinical income (due the hard work of the faculty) and research funding (with relatively minimal impact from ARRA in FY09, although greater impact is expected for 2010 [the current fiscal year]). For FY10 we are currently projecting clinical income of \$388 million and sponsored research income of \$448 million. As I have also noted in prior communications, we are one of the only medical schools with greater research than clinical revenues – even though clinical income has been increasing in recent years.

I also reported our ARRA funding results to the NAC. These currently total approximately \$91 million (although \$28 million of this represents the funding of previously submitted grants). Overall, 37.9% of ARRA funding was in research project grants, 18.9% in Grand Opportunity (GO) awards and 10.7% in Challenge Grants. At this point we have achieved about 95% of the

success we had hoped for in ARRA funding. At this juncture it appears that a significant amount of funding will carry through 2012 and help buffer the otherwise flat NIH budget. While this support for research is needed and welcomed, we all have concerns about NIH funding in FY12 and beyond.

Another big event of the past year was the three-year review of the Stanford Cancer Center, which occurred on October 15, 2009. Over the past several years, thanks to the leadership of Dr. Bev Mitchell and her colleagues, the Stanford Cancer Center (SCC) has continued to evolve. The Center now includes 311 members from 33 departments and 4 schools. Cancer research is clearly a university wide initiative. We await the final results of the review, but we are optimistic that we will achieve significant funding for the SCC.

In a related piece of good news, Dr. Doug Blayney will join us this summer as the Ann and John Doerr Medical Director of the SCC. Dr. Blayney has been the Medical Director of the Cancer Center at the University of Michigan for the past seven years and is also the President of the American Society for Clinical Oncology. I have known Dr. Blayney since he trained at the National Cancer Institute in medical oncology and have great respect for his experience as a practicing oncologist, academic leader and national advocate for the delivery of the highest quality care for cancer patients that is achievable. Stanford Hospital & Clinics and the School of Medicine support Dr. Blayney's position. He will also be the Associate Director for Clinical Care our NCI-Designated Stanford Cancer Center and the Associate Chief for Clinical Affairs in the Division of Medical Oncology of the Department of Medicine.

I also pointed out to the NAC that Stanford's excellence is directly related to its outstanding students and faculty. This past year brought in excellent medical and graduate students along with outstanding post-doctoral scholars. It also witnessed Stanford's uniqueness as measured by its disproportionate share of NIH Pioneer Award winners (four more in 2009 bringing Stanford's total to 15 of the 81 Awards given since the inception of this program five years ago). Similarly, faculty excelled in Innovator Awards, HHMI New Investigators Awards as well as a proportional number elected to the Institute of Medicine and National Academy of Sciences. Together with a number of highly distinguished awards and honors given to faculty, these metrics serve as indicators of a uniquely gifted community of excellence.

This past year also has witnessed some important transitions. One of the most notable recent ones is the announcement by SHC President and CEO Martha Marsh that she is retiring at the end of this fiscal year (see: http://deansnewsletter.stanford.edu/archive/02_22_10.html#1). There was also the welcome news to share about the arrival of Dr. Mike Synder as our new Chair of Genetics and the very recent announcement that Dr. Laura Roberts will be our next Chair of the Department of Psychiatry and Behavioral Sciences (see: <http://deansnewsletter.stanford.edu/#1>). I also reviewed recent and upcoming transitions in department leadership and other positions within the medical school. It is also notable that in addition to leadership positions, we have recruited approximately 425 physicians and scientists to our School of Medicine faculty during the past nine years. Of course there has also been attrition for a variety of reasons, but given our full-time faculty size of 840, this represents a lot of new faculty members over a relatively short amount of time (even though it is about 20% of the School's history in Palo Alto).

Looking ahead, we face both incredible opportunities and significant challenges. The uncertainty around health care reform (although this is moving to some resolution after the March 21st Congressional vote) and the volatility of support for research funding from the NIH, which is greater than we might like, make it difficult to plan for the future. But regardless of the funding constraints, we do recognize the importance of being true to our missions in education, research and patient care. The importance of sustaining and improving our record of excellence and quality in each of our missions is clear – and will be ever more essential. We also recognize the importance of renewing our talent, improving our diversity, rebuilding our facilities, and enriching our resources as among the essential components to a successful future. We have made progress in each of these areas but there is much yet to be accomplished.

We reviewed some of these opportunities with the NAC, including our efforts to promote greater translation of research through innovative programs like SPARK; rebuilding and reorganizing our facilities both on and off campus; and benefiting from incredible science and discoveries. To that regard, the NAC heard exciting progress in translating discoveries in cardiovascular research from Dr. Bobby Robbins, Chair of Cardiothoracic Surgery and Director of the Cardiovascular Institute along with Dr. Joe Wu, Assistant Professor of Medicine and of Radiology, as well in the neurosciences thanks to an update from Dr. Gary Steinberg, Chair of Neurosurgery and Director of the Stanford Institute for Neuro-Innovation and Translational Neuroscience.

The NAC will make its final report to the President and Provost, and I will share the results I am able to with you when it becomes available. That said, I did hear directly from NAC members how impressed they are by the work going on at Stanford – which is a tribute to you, our faculty, students and staff.

Recognition and Appreciation of Our Staff

What makes a great university is the quality of its people. Understandably, credit readily flows to faculty and students for their many contributions – which at an institution like Stanford are quite remarkable. However, many of those contributions would not be possible without the exceptional staff who support our missions in education, research and patient care. Even more remarkable is that our dedicated staff are so committed to Stanford that they continue to work on our behalf year after year – some for more than 30 or even 40 years.

This year we are recognizing our incredible staff in two ways. There will be a reception on Thursday April 22 at the Li Ka Shing Center for Learning and Knowledge (LKSC). We are also launching a new Employee Recognition website that I hope you will visit. It can be found at: <http://med.stanford.edu/employeerecognition/>. On the web site you will find videos honoring employees with 35 and 40 years of service, and photos and stories recognizing staff with 20, 25, and 30 years of service. Additionally, we acknowledge the two School of Medicine Spirit Award winners for this year. The web site also provides a section for “Your Comments,” a way for anyone who would like to post a message to any of the staff being honored and comment on your experiences working with these employees. I encourage you to visit the web site and join me in congratulating this year’s Spirit Award winners and our employees who have reached milestone employment anniversaries of 5, 10, 15, 20, 25, 30, 35, and 40 years of service.

Congratulations to our employee with 40 years of service:

Tom Nozaki, Department of Genetics

Congratulations to our employees with 35 years of service:

Marcia Bieber, Obstetrics & Gynecology

Beverly Bonfert, Cardiothoracic Surgery

Mary Jane Eaton, Department of Pathology

Pamela Petrie, Information Resources & Technology

Congratulations to our Spirit Award Winners:

Katie Allen, Department of Surgery, Division of Multi-Organ Transplantation

Jeff Melton, Department of Medicine, Stanford Prevention Research Center

I also want to thank the individuals who developed this new site, including Norma Leavitt, Deborah Stasi, Koorosh Davoodian, John Worley, Pam Lowney, Todd Holland, Richard Renn and Angie Lucia. Finally, I offer my deep appreciation to *all* of our wonderful staff.

The Latest Trip Reduction Results

As you all know from past communications, it is very important that we cut down on the number of people driving alone to campus during the peak traffic hours in the morning and evening in order to comply with General Use Permit (GUP) restrictions, as well as to reduce our carbon footprint.

We have received excellent news from the Parking and Transportation Office: The 2009 university-wide counts set a record for number of trips below the 2001 baseline: 634 trips below the baseline for the morning commute, and 364 below for the afternoon commute. In addition to our efforts, the large difference between the 2008 and 2009 numbers were influenced by university layoffs and the relocation of some departments to off-campus sites.

Year	Number of Trips Below the 2001 Baseline	
	AM	PM
2009	634	364
2008	454	131
2007	416	97
2006	426	164
2005	91	30

I am also pleased to report that the School of Medicine had participation well above the University average on the annual Parking & Transportation survey this past Fall (49%, as compared to 44% across the University's other schools) as well as comparing favorably in self-reported drive-alone trips. Our morning drive-alone percentage was 35% while our afternoon rate was 32%, compared to the University's other units, which averaged 38% and 35%, respectively.

However, our self-reported performance compared to the prior year has actually deteriorated, so while we are performing well compared to the University's other areas, we have not kept up to our own high standards. Last year our response rate was 58%, and our morning drive alone

percentage was 32% while our afternoon rate was 28%. The rest of the University increased by similar amounts from the prior year's survey.

Please continue your efforts to walk, ride a bicycle, or take public transportation to campus. Congratulations to the majority of you who do your part to reduce pollution and traffic congestion and keep us in compliance with the county's General Use Permit.

We Are Moving!

It has been long in coming and it won't be finished until summer 2010. But the Dean's Office, which has been long located in the Alway Building, is moving to the Third Floor of the new Li Ka Shing Center for Learning and Knowledge (LKSC). We are in our new office suite as of Monday, March 22nd! Over the next several months the LKSC will become alive as audiovisual, immersive learning equipment, furniture and finishing touches are put into place. We are anticipating welcoming students to the Berg Family Commons on the Fourth Floor of the LKSC in May, and we plan to have the building fully ready for our new medical and graduate students when they matriculate this summer and fall.

The LKSC is shaping up to be an incredible facility. I admit significant bias in being very pleased with how it is coming along and look forward to your visiting this new facility as it is phased in over the next several months.

Upcoming Events

Stanford Health Policy Forum: The Future of Health Reform

Thursday, April 1

1:00 PM – 2:30 PM

Clark Center Auditorium, 318 Campus Drive

This timely Stanford Health Policy Forum event will be a conversation on health reform with Stanford University's leading experts. Our panel will discuss what the goals of health reform should be, and why; will evaluate the current health reform efforts of the Obama Administration and Congress; and will propose what steps the country should take next to best achieve these goals. This moderated program will conclude with a dialogue with the audience.

This forum will be moderated by **Daniel P. Kessler**, Professor in Management, Law, Health Research and Policy, Graduate School of Business, Law School and School of Medicine. Featured speakers include **Philip Pizzo**, Dean, School of Medicine; **Alan Garber**, Director of the Center for Health Policy and the Center for Primary Care and Outcomes Research; **Alain Enthoven**, Professor of Public and Private Management, Graduate School of Business.

This Forum is free and open to the public. Space is limited. For more information please visit <http://healthpolicyforum.stanford.edu/> or call 650-725-3339.

Haiti...The Day After: Dr. Norris and the ED Team Share Their Story

Thursday, April 1

5:30 – 7:00 PM

Braun Auditorium (located in Mudd Chemistry Building), 333 Campus Drive

One day after Haiti's 7.0 earthquake, Dr. Robert Norris, Chief of the Division of Emergency Medicine, reached out to the ED team for volunteers to join IMC's relief effort. Throughout SHC, LPCH and the School of Medicine, individuals contributed to the effort. Stanford Hospital & Clinics and Lucile Packard Children's Hospital donated more than \$20,000 in supplies, pharmaceuticals, and equipment. The ED response team was on its way within 24 hours thanks to all of the work that occurred behind the scenes. Come listen to their experience and see their pictures first hand. Space is limited...first come, first seated.

Health Care in the US: A Work in Progress

Wednesday, April 14

4:00 – 6:00 PM

Annenberg Auditorium, Cummings Art Building, Serra Street & Lasuen Mall

The event, a panel discussion of this critically important topic, will be co-sponsored by the Stanford Emeriti Council and the Stanford Historical Society. Panelists include: Chair **Philip Pizzo**, Dean, School of Medicine, at Stanford University; **Victor Fuchs**, Henry J. Kaiser, Jr., Professor of Economics and of Health Research and Policy, emeritus and Senior Fellow at the Freeman-Spogli Institute for International Studies; **Alain Enthoven**, Marriner S. Eccles Professor of Public and Private Management, emeritus and a core faculty member at CHP/PCOR; **Alan Garber**, Henry J. Kaiser Jr. Professor of Medicine and, by courtesy, Economics; Senior Fellow at the Freeman-Spogli Institute for International Studies; **Arnold Milstein**, Chief Physician, Mercer.

Appointments and Promotions

Susan Atwater has been reappointed as Clinical Associate Professor of Pathology, effective 3/01/10.

Robson Capasso has been appointed Clinical Assistant Professor of Otolaryngology – Head & Neck Surgery, effective 3/15/10.

Laura LeCompte Dyner has been appointed as Clinical Assistant Professor of Pediatrics, effective 7/01/10.

Stephen D. Emond has been appointed as Clinical Assistant Professor (Affiliated) of Surgery, effective 3/01/10.

Christopher Engleman has been reappointed as Clinical Assistant Professor (Affiliated) of Ophthalmology, effective 1/01/10..

James I. Fann has been promoted to Professor of Cardiothoracic Surgery at the Veterans Affairs Palo Alto Health Care System, effective 3/01/10.

Nancy Fischbein has been reappointed to Associate Professor of Radiology at the Stanford University Medical Center, effective 3/01/10.

Gregory Glasscock has been reappointed as Clinical Associate Professor of Pediatrics, effective, 9/01/09.

Mary Therese Jacobson has been promoted to Clinical Associate Professor of Obstetrics and Gynecology, effective 3/01/10..

Geoffrey A. Kerchner has been appointed to Assistant Professor of Neurology and Neurological Sciences at the Stanford University Medical Center, effective 3/01/10.

Anita Kulkarni has been appointed Clinical Assistant Professor (Affiliated) of Surgery, effective 3/01/10.

Edward McNamara has been reappointed as Clinical Associate Professor of Pediatrics, effective 9/01/09.

Marc Melcher has been reappointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 3/01/10.

Marcelo Jorge Pando Rigal has been appointed as Clinical Assistant Professor of Pathology, effective 3/01/10.

Anstella D. Robinson has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 9/01/09.

Harman Singh has been appointed as Clinical Assistant Professor of Neurosurgery, effective 8/01/09..

Kathryn J. Stevens has been promoted to Associate Professor of Radiology at the Stanford University Medical Center, effective 3/01/10.

Cynthia J. Wong has been appointed as Clinical Assistant Professor of Pediatrics, effective 5/01/09.

Dean's Newsletter

April 5, 2010

We Value and Appreciate our Adjunct Clinical Faculty

I want to begin by thanking our Adjunct Clinical Faculty (ACF) for their valued and much appreciated contributions to the education of our students and trainees. We are the beneficiaries of over 650 ACF who volunteer their time and expertise to enhance and enrich our educational programs. In doing so they bring a breadth and depth of clinical and life experiences that are quite special and important and that span the entire domain of adult and pediatric medicine.

Over the last weeks an issue has arisen that may lead some of our respected ACF colleagues to question whether we value them and their autonomy and independence. Specifically this relates to the decision to extend our Stanford Industry Interactions Policy (see: <http://med.stanford.edu/coi/siip/policy.html>) to everyone who holds a Stanford title – including our ACF. When we first initiated our SIIP policies that banned gifts, free meals, speaker bureau participation and a number of other important issues, we decided to exclude our ACF colleagues. Since 2006, when those policies were adopted, there has been ever increasing attention on the financial interactions of physicians with industry, and this has become a topic of considerable scrutiny in the print media and elsewhere. In fact the recent healthcare reform legislation includes provisions requiring major pharmaceutical and device companies to publicly list payments to physicians. Such reporting has already begun on a voluntary basis. Indeed, quite surprising to me was a report in the New York Times in January that noted that the physician receiving the highest amount of industry payment for lecturing was at Stanford. This individual turned out to be member of the ACF. Not surprisingly the media does not distinguish whether a faculty title is associated with a voluntary or university-employed individual. The association is with the university or medical school – thus creating a panoply of institutional risks and queries.

I certainly make no value judgments about the right of a community physician to be part of an industry speakers' bureau and to give lectures and presentations on behalf of industry for which the individual is compensated. That is of course his or her right and personal decision. But when an individual holds a Stanford title, an association with an industry speakers' bureau is highly problematic and creates risks for individuals and for the institution. It is not possible to turn a Stanford title on and off. And it is likely that a pharmaceutical company is interested in having an individual speak or act on its behalf or because of the Stanford title. These factors create overlapping interests and conflicts.

Given this situation and the importance of protecting and valuing our Stanford name – as well as the individuals who hold Stanford titles – we have made the decision to extend our SIIP policy to everyone with a faculty title, whether voluntary or otherwise. This is an evolution of our original 2006 SIIP policy – but is consistent with our institutional goals and, in many ways, with the changes that have unfolded in academic-industry interactions over the past several years.

I apologize to our colleagues if the extension of our SIIP policies poses new and perhaps unexpected (and even unwanted) challenges. And I do recognize that some of our current Adjunct Clinical Faculty may decide to give up their Stanford appointment. Of course I hope that this does not take place. In time I do believe that the expectations we are setting will be established throughout the nation – and the feedback I have had from leaders around the country affirms that perspective. As a major academic medical center we have an obligation and a mandate to gain the public trust – and the changes we are making are one more step toward that important goal.

A Juxtaposition of Healthcare Realities

On April 1st I participated in two quite different events on healthcare. The first was the “Stanford Health Policy Forum: The Future of Health Reform” (<http://healthpolicyforum.stanford.edu/>), in which I participated in a panel discussion led by Dan Kessler, Professor in Management, Law

and Health Policy and Policy, along with Alain Enthoven, Professor of Public and Private Management in the Graduate School of Business, Emeritus, and Dr. Alan Garber, Director for the Center of Health Policy and the Center for Primary Care and Outcomes Research and the Henry J Kaiser, Jr. Professor of Medicine and by courtesy, of Economics and Health Policy and Research. We had a spirited debate on the historic healthcare legislation signed by President Obama last week in which there was a wide range of opinion that went from gloomy to optimistic.

While I recognize that there are many imperfections in the recently passed legislation, I am on the more optimistic side of the debate, and I underscored that, at a minimum, the new legislation recognizes that health care should be extended to all USA citizens and that protection of healthcare benefits from private insurance also needs regulation. That said, we all acknowledged that the new legislation does little to control the cost of healthcare and that this will need to be a dominant focus going forward. While some of the panelists argued that they would not have “voted” for the reconciliation bill, I underscored that doing nothing was not an option given the ever-rising cost of healthcare in the USA – where the amount spent on healthcare is more than twice that of any other developed nation. At least the new legislation will serve as a beginning for healthcare reform that will surely evolve, be refined and even significantly changed over the next decade or more. But it is a historic beginning and that is worth recognizing and celebrating.

While I described the debate on the reform of the US healthcare system as ranging from gloomy to optimistic, I gained an important perspective on this issue during the presentation later that same day by members of the Stanford Medicine community who had traveled to Haiti to take part in the relief efforts there following the horrendous earthquake that occurred on January 12th. (see: <http://stanfordmedicine.org/communitynews/2010winter/haiti.html>). The Haiti presentation was sponsored by Stanford Hospital & Clinics, the Lucile Packard Children’s Hospital and the Stanford School of Medicine. Eight incredible individuals from Stanford Emergency Medicine shared their experiences, reflections and lessons learned from their weeks in Haiti. They described what they encountered on their arrival in Haiti and the conditions in which they worked and cared for incredibly injured and impaired adults and children. It was truly both extraordinary and devastating.

As a physician who spent decades caring for children with catastrophic illness I found myself struggling to imagine the incredible human suffering that occurred in Haiti in a dramatically compressed time and space. This was the experience that our Stanford colleagues and other members of the medical community from around the world encountered. The Stanford team who presented on April 1st represented only a portion of the overall contributions by Stanford doctors and nurses. But the nurses and physicians who spoke openly, honestly and compellingly at this event deserve our profound admiration. They included Paul Auerbach, Ian Brown, Jonathan Gardner, Gaby McAdoo, Anil Menon, Bob Norris and Julie Racioppi. They are each medical heroes, deserving of our deepest respect for their selfless contributions to relieve extraordinary suffering during the incredible and horrible disaster in Haiti.

For me the incredible juxtaposition of these two events during a five-hour period of my day was striking in a deeply personal way. Going from the economic arguments about healthcare in the world’s wealthiest nation to the devastation and near absence of healthcare in one of the world’s

poorest nations gave deep meaning to the role of health professionals. It was a stark reminder of what is really important and also of the value of health professionals committed to relieving human suffering rather than economic gain or loss. That focus has been absent from much of the US healthcare debate – but it is the sole focus of the citizens of Haiti. That too is a lesson for all of us.

Moving Toward Improved Clinical Effectiveness

During the past several years we have had a concerted and joint effort among the School of Medicine, Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH) on the quality of the patient care we are delivering. This has been both a top-down and bottom-up effort, and it has resulted in significant improvements in our quality performance when compared to peers on a national level. Considerable and continuous improvements are needed, but there can be little doubt that these have been made – and will continue to be made. More recently, a joint effort between Stanford Hospital & Clinics and the School of Medicine to improve clinical effectiveness was launched. The organization and governance of this effort includes a Clinical Effectiveness Leadership Team that works in conjunction with a Clinical Effective Data Committee and a Clinical Effectiveness Council.

At the SHC Board of Directors' Quality Performance Committee meeting of March 24th, Dr. Kevin Tabb, Chief Medical Officer, gave an update on ongoing efforts of the Clinical Effectiveness program. Of interest, he highlighted a number of projects that were proposed directly by medical staff and nursing professionals and that are currently underway. They represent a range of activities and issues and share in common the goal of improving clinical effectiveness. Examples include:

- Reduction of surgical site infection
- Reduction of hospital acquired infections
- Reduction in B mode scanning in orthopedics
- Clinical resource management
- Clinically appropriate utilization of blood products
- Daily and Pre-operative lab test utilization
- Reduction in mortality due to sepsis
- Reduction of the length of stay of patients undergoing colorectal procedures
- Patient transfer task force
- Revision of insulin order sets for diabetic patients
- Heart failure management and readmissions
- Resource utilization for sequential compression devices
- Utilization of high cost drugs

This list is not inclusive and is part of an expanding effort to improve clinical effectiveness throughout SHC. Some of these projects are specific to a discipline or clinical service while others are broad and more comprehensive. They are each important in weaving a more integrated effort to improve clinical effectiveness step by step.

Dr. Tabb also announced the initiation of a new Technology Assessment Committee (TAC) that will focus on new medical devices, surgical procedures, diagnostic tests and new pharmaceutical

and clinical programs and evaluate them according to their clinical, financial and operational impact. Given the impact that technology and drugs play on increasing healthcare expenditures, this is an extremely important effort. Importantly, the work of the TAC is multidisciplinary and includes input from physicians, nurses and administrative leadership.

As healthcare reform evolves, efforts to control cost will be an imperative for SHC. But controlling costs should not be at the expense of innovation and development. Nor should technology and new developments be embraced or deployed without assessing their utility and costs. So the TAC is likely to be an important committee – and one whose charge, scope and impact will surely evolve in the years ahead.

The Respectful Workplace – An Ongoing Issue

On May 14, 2002 I announced in the Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/05_13_02.html#1) the initiation of a series of seminars and workshops on the "respectful workplace." These programs were launched about a year after I joined Stanford to address the many behavioral and personal interaction difficulties and communications challenges that had impacted faculty, staff and students. The kinds of issues for concern included raised voices, heated language, name-calling, belittlement and intimidation; displays of anger, rage or threat; rude, offensive or abusive conduct; public criticism of an employee; inappropriate description of employees by those in charge of programs; racism and discrimination; and disparagement of employees with diverse backgrounds or lifestyles. While these may sound like extreme examples, they were not infrequently reported behaviors in 2002 and, while progress has been made, they still exist today. Each of us has a responsibility to help assure a respectful workplace in our communications with each other, regardless of whether these occur with the spoken or written word, or with email or other forms of interaction.

In 2002 we established a School goal regarding the Respectful Workplace. I would like to reiterate that goal again: "Stanford University School of Medicine is committed to providing a work environment that is conducive to teaching and learning, research, the practice of medicine and patient care. Stanford's special purposes in this regard depend on a shared commitment among all members of the community to respect each person's worth and dignity. Because of their roles within the School of Medicine, faculty members, in particular, are expected to treat all members of the Stanford community with civility, respect and courtesy and with an awareness of the potential impact of their behavior on staff, residents, fellows, students and other faculty members."

Over the past several years "Respectful Workplace" presentations and discussions have been given to all School of Medicine departments and have been discussed during the orientation of new faculty and staff appointments. While we have not experienced some of the significant challenges that existed in the 1990's and early part of this decade, I am well aware that challenges and problems still persist. Some have taken new forms, one of the most notable being email communications. The topic of email etiquette has been much discussed, especially the fact that the lack of face-to-face contact permits some to offer comments that are inappropriate or even libelous. What is missed is that email communications are virtually always retrievable during an investigation. Further, using "confidential" does not assure that email cannot be used in a legal discovery. So it is incredibly important for everyone using email to do so with

“respect” and with the recognition that whatever they communicate can become public knowledge. I am aware that faculty, students and staff communicate in ways that create individual and institutional liabilities – an issue that needs further discussion and education.

There are many additional examples and issues – all of which underscore the need to rekindle our focus on assuring a “Respectful Workplace.” Over the next months the Human Resources Group will be seeking your input regarding your own experiences and observations. We will use this to help guide future programs that will heighten, inform and engage all of us in being part of a Respectful Workplace.

International Academic Medical Centers Seek Innovation

Academic medical centers comprised of schools of medicine, teaching hospitals and varying constellations of other professional schools (e.g., nursing, public health, pharmacy) have been part of American medicine since early in the 20th century – especially since the 1910 Flexner Report, which defined medical schools and centers. In other parts of the world, academic medical centers are new entities that are endeavoring to overcome the challenge of split alignments between Ministries of Education and Health. As these international centers have evolved, they have begun to explore new funding mechanisms – not dissimilar to those of American Academic Health Centers (AAHC). This was the topic of discussion at the recent International Forum sponsored by the Association of Academic Health Centers on March 22-23rd.

The models being pursued are quite different. In Canada, for example, a member owned and unified entity has been created in which the Intellectual Property from all member medical centers comes to a single entity under the umbrella of the MaRS Discovery District (see: <http://www.marsdd.com/index.html>). Other models are being explored in The Netherlands, and Singapore among others. Most are looking toward ways to bring products of discovery forward to industrial partners. They vary in their intent to commercialize and, in some instances, they get close to the borders of conflict of interest. Understandably there was considerable discussion about how academic medical centers in the USA are redefining their relations with industry to create partnerships that seek to avoid conflicts of interest. This is a major topic in its own right and one that organizations like AAHC are seeking to evaluate. It seems clear that there is much to learn in this area as different models are pursued in the USA as well as worldwide. Sharing what is working and not will be important as this new territory is explored.

Call for Judges and Volunteers for the Intel Science & Engineering Fair

We have received a request for scientific judges and volunteers for the Intel Science and Engineering Fair that will be held on May 11-12 at the San Jose Convention Center. This education event will bring together some 1500 high school students from around the world to compete for \$3 million in awards and scholarships. Currently there is a shortage of qualified judges in a number of areas where the School of Medicine has expertise – especially animal science, biochemistry, cellular and molecular biology, medicine and health. Judges should have an MD or PhD degree or an MS with 5-6 years of experience. To learn more about this opportunity to volunteer and support the future of science and engineering see www.isef2010sanjose.org. You can apply on-line. Thanks for considering this request.

Notable Events

- ***The Mini-Med School*** begins its Third Quarter: On Tuesday evening, March 30th we opened the Spring Quarter of our Mini-Med School – “Transforming our Understanding of Human Health and Disease” (see: <http://med.stanford.edu/minimed/spring/>). We began with a presentation on the immune system by Dr. David Lewis, Professor of Pediatrics, and will move to discussions of autoimmunity and then to vaccines, areas closely tied to the immune system. Later in the quarter we will consider movement and movement disorders and then the important issues of gender in health and disease. Subsequent topics will include aging and such contemporary issues as obesity. We will end the quarter with a series of presentations on cancer, focusing on its biology, early diagnosis and treatment. As with the Winter and Fall Quarters, we have great interest and participation in the course. The Fall Quarter is currently available on Stanford iTunes (<http://med.stanford.edu/minimed/fall/>) and the Winter Quarter will be posted on iTunes shortly.
- ***Frontiers in Health:*** On March 31st we hosted our “Spring Frontiers in Health,” focusing on Personalized Genomic Medicine. Some 300 members of the community joined us in the Arrillaga Alumni Center and participated in three types of discussion. The first was dialogue with faculty members who sat at each dinner table and engaged the community by describing their work and research. The second discussion focused on three scientific presentations on genomic medicine by three outstanding faculty members: Dr. Russ Altman, Chair of the Department of Bioengineering and Professor of Bioengineering, Genetics, Medicine, and by courtesy, Computer Science; Dr. Iris Schrijver, Associate Professor of Pathology and director of the Molecular Genetic Pathology Laboratory; and Dr. Mike Snyder, Professor and Chair of the Department of Genetics and Director of the Stanford Center for Genomics and Personalized Medicine.

Following their presentations, each of the speakers engaged in a panel discussion led by Paul Costello, Executive Director of Communications and Public Affairs, which also included a discussion with the attendees. It proved to be an informative and far reaching discussion of the incredible and transformative changes taking place in genetics and genomics and their impact on the individual genomic profiling that will soon become part of personalized medicine. The positive benefits of these amazing new technologies along with their risks as well as personal and societal dilemmas were featured. The future of genomic medicine has been an important topic among our students and faculty during the past year, and it was important to extend this dialogue to our community. There is no question that this is a topic we will be revisiting many times in the years ahead. And there is also no doubt that this is a field where Stanford currently excels and where we will surely make incredible contributions in the very immediate future.

Upcoming Events: Malcolm Gladwell

- **Medicine and the Muse 2010: An Arts, Humanities and Medicine Symposium**

Thursday, April 8th
5:00 pm followed by reception at 7:00 pm
Hewlett Teaching Center, 370 Serra Mall

Malcolm Gladwell, noted author of *The Tipping Point*, *Blink*, *Outliers* and *What the Dog Saw* will speak at the 2010 Medicine and the Muse, An Arts, Humanities and Medicine Symposium. This wonderful annual event will also include presentations, music and art exhibits by Stanford Medical Students. For additional information contact Paula Bailey pbailey@stanford.edu or <http://bioethics.stanford.edu/arts/>

- **Health Care in the US: A Work in Progress**

Wednesday, April 14

4:00 – 6:00 PM

Annenberg Auditorium, Cummings Art Building, Serra Street & Lasuen Mall

The event, a panel discussion of this critically important topic, will be co-sponsored by the Stanford Emeriti Council and the Stanford Historical Society. Panelists include: Chair **Philip Pizzo**, Dean, School of Medicine, at Stanford University; **Victor Fuchs**, Henry J. Kaiser, Jr., Professor of Economics and of Health Research and Policy, emeritus and Senior Fellow at the Freeman-Spogli Institute for International Studies; **Alain Enthoven**, Marriner S. Eccles Professor of Public and Private Management, emeritus and a core faculty member at CHP/PCOR; **Alan Garber**, Henry J. Kaiser Jr. Professor of Medicine and, by courtesy, Economics; Senior Fellow at the Freeman-Spogli Institute for International Studies; **Arnold Milstein**, Medical Director, Pacific Business Group on Health; faculty member, UCSF Institute for Health Policy Studies.

This event is free and open to the public. Ample time will be set aside for audience participation.

Awards and Honors

- **Dr. Bill Newsome**, Professor of Neurobiology and Member of the Howard Hughes Medical Institute, has been awarded the Karl Spencer Lashley Award of the American Philosophical Society for his work on nervous system integration. Of note, Dr. Eric Knudson, also Professor of Neurobiology received this same award in 2008. Please join me in congratulating Dr. Newsome on this wonderful honor.
- **Dr. Alice Whittemore**, Professor of Health Research and Policy, has been selected as the 2010 recipient of the Nathan Mantel Lifetime Achievement Award in Statistics and Epidemiology from the American Statistical Association. This award recognizes lifetime contributions to the development and application of statistical science to problems and issues in epidemiology. Please join me in congratulating Dr. Whittemore on this highly prestigious award.
- **Dr. Mary K Goldstein**, Professor of Medicine, has been named the recipient of the 2010 Under Secretary's Award for Outstanding Achievement in Health Services Research, the

highest honor for a VA health services researcher. You can read more about this major award and Dr. Goldstein at

http://www.hsrp.research.va.gov/for_researchers/awards/under_secretary/awardees/2010.cfm. This is a major honor and we offer our deep congratulations to Dr. Goldstein.

- **Dr. Brad Efron**, Max H. Stein Professor and Professor of Statistics and of Health Research and Policy, will add to his many honors with the Distinguished Alumni Award from the California Institute of Technology (see: http://media.caltech.edu/press_releases/13332). This is a wonderful honor. Congratulations to Dr. Efron.
- **Dr. Michael Longaker** was named the first recipient of the American Association of Plastic Surgeons Basic Science/Translational Researcher of the Year Award. He also delivered the Joseph E. Murray Lecture at the 89th meeting of the American Association of Plastic Surgeons in San Antonio, TX .
- **Dr. Michael Federle**, associate chair for education and professor of radiology, was recently honored with the 2010 Society of Gastrointestinal Radiologists (SGR) Walter B. Cannon Medal Award, which is bestowed annually upon a distinguished gastrointestinal radiologist. Dr. Federle received this accolade for his sustained achievement over the course of his career. He was honored with his medal award at the 2010 Abdominal Radiology Course (ARC) Meeting in Orlando, Florida, on February 21-26, 2010.
- **Dr. Gary H. Glover**, director of the Radiological Sciences Laboratory in the Richard M. Lucas Center for Imaging; professor of radiology and, by courtesy, of electrical engineering and of psychology, has received the Outstanding Achievement Award from his alma mater, the University of Minnesota. This award is the highest honor an alumnus can receive from the University of Minnesota, second only to an honorary degree.

Dean's Newsletter

April 19, 2010

Council of Deans Considers Some of the Major Issues Facing Medical Schools

At the Spring Council of Deans (COD) Meeting on April 10-12th, we focused on some of the major challenges facing medical schools and academic medical centers now and into the future. At last year's meeting the COD developed a number of action steps that have been worked on during the past year and that we are in the process of refining and updating. They include the following areas:

- ***The public has high expectations for academic medicine and we need to better articulate and demonstrate our "value proposition."*** More specifically we have work to do to fully demonstrate our value to and impact on our communities.
- ***The strengths and attributes that allowed academic medicine to succeed in the past are not likely to be sufficient in the future.***

- ***Medical education is a continuum in which the medical school plays a central role in the development of the physician.*** Here we need to better define the continuum of medical education (from pre-college through medical school, residency and beyond).
- ***The research enterprise as we know it must change at the local and national levels.*** I have led this workgroup and will offer some additional comments below.
- ***Academic medicine needs to be at the table in addressing healthcare reform.***
- ***Our current business model is no longer sustainable.*** This topic was also addressed by our plenary speaker, Professor Clay Christensen, the Jane Cizik Professor of Business Administration at the Harvard Business School and author of *The Innovator's Dilemma* and *The Innovator's Prescription* (which focuses on healthcare). His views shatter many of our current beliefs and constructs, and he offered some provocative insights that I will comment on below.
- ***We need better alignment with our partners at both the local and national levels.*** This includes alignment between the medical school, teaching hospital and practice plan. Parenthetically, even with our challenges I think we have succeeded at Stanford in this area better than many (even most) of our peers.

The Research Enterprise

As I mentioned above, I chaired the workgroup that focused on supporting the research enterprise. In doing so I emphasized that research is a defining mission for academic medical centers. During the past several decades the basic and clinical science research programs have grown considerably at most medical schools and academic medical centers, fueled primarily by competitive sponsored federal funding, especially from the National Institutes of Health (NIH). Faculty size (especially clinical faculty) has also grown significantly - nearly 11-fold since Medicare was established in 1965 – making many academic medical centers significantly larger, more complex and more expensive entities. Their funding is highly leveraged and includes sponsored research funding (largely from the NIH), clinical income (which in many centers subsidizes the missions in research and education), tuition (which doesn't cover the cost of education), state or public support, endowment income, patent and royalty payments and gifts. Further, as important and fundamental as research is to our core mission, it is also a cost center and requires an approximately 25% subsidy from institutional sources to break even.

Until 1998 NIH funding increased at a reasonably steady rate that was at or above inflation. Between 1998 and 2003 the budget of the NIH doubled, and most academic centers responded by increasing the size of their faculty and the resources and infrastructure to support research. However, following 2003 the NIH budget was flat and below inflation until 2009, when the American Recovery and Reinvestment Act (ARRA) provided a significant, albeit two-year time limited, increase in NIH funding. Looking beyond 2011-2012, it seems likely that the NIH budget will be challenged. Indeed institutions that have grown in size or built research space based on the assumption of continued NIH support now face serious financial challenges. Possible scenarios include a continuation of a flat NIH budget (thus a loss of purchasing power)

or increases below, at or slightly above inflation (see additional comments below based on the presentation from Francis Collins, Director of the NIH).

No matter how one looks at the equation, it seems inevitable that competitive research funding will be more limited, posing a serious threat to the US biomedical research enterprise. How academic medical centers respond to research funding challenges will impact their future excellence and value to the future of biomedicine. This scenario is further influenced by our nation's economic climate, which has put major limits on the availability of state support to medical schools and institutions. The economic downturn has significantly and negatively affected university and medical school endowments as well as the resources available to foundations that support biomedical research. Gifts from individual or institutional donors have also been impacted by the economic downturn. And with healthcare reform now moving forward it is also inevitable that revenues to hospitals and medical centers will decline in the years ahead. Thus it is clear that business as usual – and certainly one based on growth – is not sustainable.

Based on these scenarios, a number of conclusions are evident. First, it is important that medical schools and medical centers critically examine their size and scope. Too much emphasis has been placed on the amount of NIH funding an institution receives as a metric of excellence, instead of focusing on quality. It is much more important to concentrate on quality instead of numbers since that is a much better way to remain competitive and adaptable. Thankfully this is the model we have largely followed at Stanford. This approach affects how institutions support their research mission related to people (faculty recruitment, retention, career guidance as well as support for students and postdoctoral fellows and trainees); the infrastructure required to support a research mission (including facilities, size of labs and space charges, shared equipment, animal costs and the function of cores). Unfortunately it is clear that our institutions each play a role in increasing the price for recruitment and retention by our shared competition for faculty and students.

Developing metrics to define individual and institutional success is important. Individuals and institutions also need to define the mix and blend of research funding, including state and federal sources, foundation and gift support as well as revenue from the clinical mission of academic centers. How these funding sources will change as a function of the current economic climate and the changes emanating from healthcare reform will require careful monitoring and thoughtful planning.

It is also important for institutions to address ways of sharing resources within their own walls (cores, shared equipment, expectations and funding for space, etc) as well as to look toward regional interaction and shared resources. Examples such as the New York City Structural Biology Consortium or the Massachusetts Computation Collaborative or the San Diego Stem Cell Consortia deserve attention and broader replication.

In tandem with the interactions of academic medical centers with the public and private sector, it is important to find ways to rebase academic-industry relations in ways that conform to new conflict of interest policies but which also promote the translation of basic research to clinical application. Finally, it is important that academic medical centers and the AAMC be better

advocates for research to the broad public and private sectors they serve and that they demonstrate the value proposition of academic medicine and biomedical research.

Is the Current Model Sustainable?

Over the years Professor Clayton Christensen has offered provocative insights on disruptive technologies and how once successful business enterprises were transformed or became extinct with innovations that are simpler and more decentralized. The history of computing is a notable example in its evolution from the central main frame to the increasingly decentralized mini-computer to personal computer to laptop, PDA and beyond. Christensen posits that the current tertiary hospital is not sustainable, because it is organized around the principle of having the capability of doing everything for everyone. This results in a costly infrastructure that is beyond the needs of most patients and that requires spreading costs (and thus increasing the overall cost for care).

Christensen further argues that the complexity of most hospitals fosters both inefficiency and the lack of coordination that impacts the patient experience and related outcomes. In specialties or services where the care model can operate more autonomously (e.g., orthopedics, ophthalmology and certain surgical procedures like hernia repair), a focused facility is likely to be more successful. In contrast, when multiple consulting services are needed to provide high-quality care (e.g., cardiac care), a specialty facility is likely to be less successful. While Christensen would argue that an integrated delivery system might be the most effective model, he also acknowledged that such systems (e.g., Kaiser, Geisinger) are less successful in fostering innovation. Christensen also believes that the overall complexity of an academic medical center is problematic specifically in the overlap of its research and education missions – which might be done more effectively if they were permitted more discrete execution.

Relevance to Stanford Medicine

In my view, Christensen poses a number of important and provocative challenges but not really a solution that optimizes care delivery and that still fosters innovation and discovery. I continue to believe that these challenges are an opportunity for a small and integrated institution like Stanford to excel – but it is also clear that we have considerable work to do to optimize patient care, quality, service, cost and innovation – and also to excel at education and research. But striving toward excellence rather than being reduced to the mean must be our aspiration and goal.

As I assess the status of Stanford Medicine against the challenges posed by Clay Christensen and the issues posed at the Council of Deans, I believe that many of the decisions we have made over the past almost ten years have positioned us well – whereas as in other areas we still have work to do. For example, the fact that Stanford remains one of the smallest schools among its peers has its limitations (especially when rankings based on total NIH funding are published). However, the fact that we have emphasized quality over quantity continues to serve us well and increasingly is a model that other schools are seeking to emulate. That said, it is imperative that we continue to assess the way we are organized and how we conduct and integrate our missions in education, research and patient care. For example, we have made strides in our education programs, including better coordinating the path from medical student to resident and fellow – a goal that still needs considerable effort. We will address this further as we launch three new planning efforts in education that we hope to complete over the course of this year – one aimed

at medical education, the second at graduate education and the third at postdoctoral training. At the end of this process we will certainly want to assess their interrelations – but some focused planning is important initially.

We also need to further assess our patient care activities and carry out important forward-looking strategic planning in areas that link our research and clinical missions to foster innovation: cancer, cardiovascular, neuroscience, regenerative medicine, immunology-transplantation. These planning efforts will help shape our opportunities and needs in faculty size and scope and the resources needed to support them. Overall, we need to continue to ask the core question of how we bring value to our community through the innovations we discover, the services we provide, the quality we deliver and the affordability of our programs and services.

Updates on the NIH from Dr. Francis Collins

Dr. Francis Collins, Director of the NIH, addressed the Council of Deans meeting on April 12th. He reviewed the major themes he has been forecasting for biomedical research and also highlighted some initiatives that follow the recent healthcare reform legislation. He acknowledged that, at the completion of the ARRA (American Recovery and Reinvestment Act) funding that concludes in FY11, the biomedical research community faces a “cliff” that will have a significant impact on research funding. Even though the President is highly supportive of science and technology, the nation’s economy has seriously eroded the ability to fund the NIH at a level that would return success rates to the 30% level. In fact to do that would require an NIH budget of \$37.5 billion compared to the \$32 billion that is now approved. Accordingly, Collins projected success rates of 20% - which are certainly higher than a number of Institutes predict given the current funding levels.

While Dr. Collins emphasized his continued support for basic science research, the themes he presented fall into more of a big science theme. He has discussed these previously (see the January 1st issue of *Science* 2010; 328:35-36

(<http://www.sciencemag.org/cgi/content/full/327/5961/36?ijkey=RFCOTgo29UiRY&keytype=ref&siteid=sci>), as well as in the interview he did with Paul Costello, Executive Director of Communications and Public Affairs, which can be found on 1:2:1 (see: <http://med.stanford.edu/121/2009/collins.html>). They include:

- ***Applying the opportunities emerging from genomics and other high throughput technologies that will impact human disease.*** This is one of the “big science” agenda items he has referred to previously. It includes the application of next generations of DNA sequencing, nanotechnology, small molecule screening, the use of “comprehensive approaches” that combine “all” genes, proteins, common variants, etc. for exploratory rather than hypothesis driven research on such challenges as cancer, autism, the microbiome. In these instances a strong effort on computational biology is critical.
- ***Translating basic science into clinical medicine*** using technologies like small molecules and stem cells, among others. An example Collins cites is the program for Therapeutics for Rare and Neglected Diseases (TRND), which will allow promising compounds to be taken through preclinical testing by NIH to promote translational research.

- ***Putting science to work in healthcare reform*** by focusing on comparative effectiveness, prevention and personalized medicine, pharmacogenomics, health disparities, regulatory science (in collaboration with the FDA), health information technology and health economics.
- ***Promoting global health*** in collaboration with organizations like the Bill and Melinda Gates Foundation to promote the discovery of novel targets in pathogens and facilitate advances in diagnostics, treatment and prevention strategies. He also cites a role for the NIH in helping to build capacity and training opportunities in the developing world.
- ***Reinvigorating and empowering the biomedical research community*** by thinking more creatively about training and career development awards. Specifically he cited the prospect of a Whitehead-like model to support early independence for selected graduate students as a way of shortening the time to achieving peer-reviewed RO1 funding. He also emphasized the importance of not allowing funding constraints to diminish innovation – which is evidenced by programs like the NIH Pioneer Awards, New Innovator Awards and Transformational RO1 awards.

In addition to these initiatives, Collins noted two programs that were contained in the healthcare reform legislation and that could have an impact on medical schools and academic health centers – although the details are still somewhat sketchy. These are:

1. ***A Patient-Centered Outcomes Research Institute*** that would be overseen by a Board of Directors, receive direct funding as well as future support from a trust fund, and promote Comparative Effectiveness Research (CER) in conjunction with the Agency for Healthcare Research and Quality (AHRQ). Collins estimated that this program would be likely to achieve funding at the \$500 million level per year. This is in addition to the other funding sources for CER through NIH and AHRQ. Clearly this is an area that we need to pay more attention to, and I am hopeful that we will make progress through programs like our new Center for Clinical Quality and Effectiveness, which I will be announcing formally soon.
2. ***The Cures Acceleration Network***, initially proposed by Senator Arlen Specter (D-PA) to be a freestanding agency, will now be located in the Office of the Director. Its stated goal is to advance the development of new therapies and cures for debilitating and life-threatening diseases by removing barriers between laboratory discoveries and clinical trials. If this program is funded (it is not at this time), it could contain project grants of \$15 million along with partnership grants. While the details are limited, it sounds somewhat like the Disease Planning Grants funded by the California Institute of Regenerative Medicine, which are designed to promote the translation of basic laboratory research in stem cell biology into clinical trials.

In sum, there is some good news and some obviously concerning news. The good news is that the current Administration clearly supports and values science and biomedical research. There also seems to be a strong commitment to support basic research and also innovative ideas and proposals. A commitment to supporting the trainees and fostering the pipeline for bioscience

research is clearly stated. It is also evident that there will be an increased focus on big science, collaborative research efforts (including through the CTSA network) and stronger linkages of basic research to healthcare delivery, regulatory science, and clinical and translational research than has been the case in the past. How the balance will be struck remains to be seen. At the same time, the level of funding available to support the biomedical research mission of the nation is less than optimal, making it ever more critical that at Stanford we focus on quality in our applications and that we anticipate and address the new funding areas being delineated. Some of these play to our current strength, whereas others will require building expertise – but I feel confident we can do that, even though I know this will be a challenging time.

Medical Student Applicants Return for Admit Weekend

On April 9-10 some 72 students admitted to the School of Medicine returned to campus for Admit Weekend 2010. In addition to meeting each other and current students and faculty, this highly talented group of students received updates on the curriculum and scholarly concentrations opportunities as well as advising and support services, including financial aid. They had a chance to tour the medical school (including the new Li Ka Shing Center for Learning and Knowledge) as well as the hospitals and university. Where to attend medical school is a life changing decision and, while our admitted students have a number of choices, I would hope that the distinctive characteristics of Stanford are readily apparent. Our exceptional excellence in research, unique interactions with the other schools at Stanford and close partnerships with our affiliated teaching hospitals and community are complemented by the commitment of our faculty, students and trainees to our tripartite missions in education, research and patient care. I can certainly say that whenever I have the opportunity to view the breadth and depth of excellence at Stanford, I am deeply impressed and very grateful to be a member of our Stanford community.

US News & World Report: Relativity, Perceptions, Explanations (and Some Excuses)

Let's face it - I truly dislike the annual exercise of the US News & World Report (USNWR) ranking of medical schools. My major issue with these annual rankings is that some of the metrics are misguided and can foster perverse incentives. Since coming to my role at Stanford I have regularly expressed my concerns to the editors of USNWR in person and in writing. Among my messages is that they are too focused on the size of the medical school and not enough on quality. Specifically, a number of the more heavily weighted metrics do not adequately or appropriately measure the true excellence of research and education programs. For example, 20% of the weighted score is based on total NIH grants dollars at the institution, which reflects more the size of the research enterprise than its quality. Indeed, given the small size of the research faculty at Stanford compared to peer "research intensive" intensive medical schools, it is not a surprise that we do not compete in this area compared to medical schools that have twice to ten times the number of faculty. In fact we are 12th in total NIH grants. On the other hand, NIH dollars per faculty member is a better measure of the success of faculty, and on this measure we are #1 in the nation.

While I was successful in persuading the USNWR editors to blend total funding with funding per faculty member, USNWR still chose to weigh the score 2:1 in favor of total funding, so the impact of size is more powerful than quality. Even more importantly, other important measures

of research success and quality are not included at all, many of which would help students to assess the research faculty. For example, it would help to know the number or proportion of faculty at a medical school who were members of the Howard Hughes Medical Institute program or who had been elected to organizations like the Institute of Medicine and National Academy of Sciences or other prestigious organizations. Of course there are other examples of excellence beyond research funding. Further, too much emphasis is placed on the size of the faculty in the faculty/student ratio metric. It would be more useful to provide the success of faculty in mentoring and advising students or the number of students engaged in research with the faculty or who had scientific publications during medical school.

What is really concerning in the USNWR ranking is the emphasis on GPA and MCAT score as a measure of student excellence at the exclusion of any metrics that address other measures of student success along with the diversity of the students, the institutional support for their education or amount of indebtedness on graduation. From my point of view, having schools compete on size and MCAT scores is simply too narrow and poorly focused.

Of course, I had all these same concerns a year ago and have communicated them to USNWR over the years. But despite these concerns and convictions, Stanford was ranked #6 last year – although in reality we were tied with three other schools (Yale, Duke and U. Washington for that slot). So, relatively speaking we were somewhere between number 6 to nine. In the USNWR issue on April 15th, Stanford's rank dropped to 11th – which I obviously don't like. How could that happen in just one year – especially since the ranking of Stanford by our peers place us fourth? In reality, given the impact of total NIH dollars, small changes in other metrics made all the difference. For example, our ranking on MCAT scores went from 7th (at 11.6) to 10th (at 11.3), and ranking in quality assessment by Residency Program Directors went from 4th to 5th place. These changes were enough to move us out of the group tied for 6th place to 11th place. But in reality this was due to only a 2 - point difference in the aggregate score, which makes all these comparisons really insignificant – both statistically and in many other ways.

When all is said and done, I would like to think that thoughtful individuals would see through the ranking and not confuse them with quality. But I also recognize that the simple change from 6th to 11th elicits an emotional response. At the same time I am proud of the fact that our faculty are among the best in the world on the metrics that really count and that we are ready and willing to select outstanding students who come from diverse backgrounds and with amazing life experiences. And I am pleased that our peers rank us so highly. OK, I have shared my reactions – now it is time to move on.

The Stanford Cancer Center Holds its Annual Retreat

The Stanford Cancer Center (SCC) held its Annual Members Retreat on April 7th at Quadrus Conference Center. Dr. Beverly Mitchell, the SCC Director, gave an update on the status of our review by the National Cancer Institute and sought to foster interactions and collaborations among the Stanford cancer community. You may recall that Stanford succeeded in receiving designation by the NCI in 2007 and had its three-year review in October 2009. Over the past several years our cancer programs have grown in size, integration and success. Since 2006, 50 new faculty in cancer-relevant disciplines have been recruited to 13 basic or clinical science

departments. At the same time, the membership in the SCC has grown from 260 to 315 members, and the funding from the NCI has grown from \$36 million to \$42 million (with total cancer relevant funding increasing from \$47 to \$65 million). Perhaps even more important is the excellence of the science that is being conducted and the increasing amount of interaction and collaboration that is taking place in research and patient care. While Stanford has a number of truly outstanding programs I continue to believe that our cancer programs will prove to be one of our most important and significant programs in the future because of the important connections and opportunities they afford in patient care, research and education. I was very pleased to spend a little time at the retreat and to witness firsthand the excellence and depth of our Stanford Cancer Center community.

Call for Nominations: Postdoctoral Mentoring Awards 2010

The Stanford University Postdoc Association (SUPD) is pleased to announce the third annual SUPD Postdoctoral Mentoring Award. This award aims to recognize faculty and staff scientists who show excellence in supporting the development of postdocs at Stanford into creative independent thinkers, teachers, administrators, managers and professionals. The nominee must have mentored the nominator, but need not have been their primary advisor. The selection committee, composed of postdoctoral scholars will compile a shortlist of nominations, which will then be considered in more detail. Two awards are typically made. To learn more about the award or to submit a nomination, please go to: <http://supd.stanford.edu/award>. The deadline for nominations is Friday, April 23, 2010.

Upcoming Event

27th Annual Stanford Medical Student Research Symposium

3:00 pm

Thursday, May 13, 2010

Ballroom, Li Ka Shing Center (LKSC), 291 Campus Drive

Thirty-eight MD and MD/PhD students and three MD-student groups will present their original research projects carried out in laboratories, clinics and the community - locally and abroad. Students will be available at their posters for informal discussions from 3:00pm-5:30pm. At 5:45 pm following closing remarks, the Stanford University Medical Center Alumni Association will announce the students with the outstanding research posters. For information about this event, please contact Mara Violanti (marav@stanford.edu).

Awards and Honors

- **Dr. Ross Bright**, Associate Dean for Alumni Affairs, Emeritus, is the 2010 Recipient of the J.E. Wallace Sterling Lifetime Alumni Achievement Award. During 18 years Dr. Bright served under three deans and championed the importance of alumni relations. Among his many contributions was the broadening of the Alumni Association to include graduate students, residents and postdoctoral fellows. Dr. Bright was instrumental in the development of the Stanford University Medical Center Alumni Association magazine “Bench and Bedside.” I have been honored to work with Dr. Bright for nearly half of his

tenure as Associate Dean and have tremendous respect for his dedication and commitment to Stanford and its alumni. Please join me in congratulating Dr. Bright.

- **Dr. Sheri Fink, MD** won the 2010 Pulitzer Prize for her joint project with ProPublica and The New York Times on an investigative reconstruction of what has been described as euthanasia by doctors at the Memorial Medical Center in New Orleans after they had been stranded by Hurricane Katrina (see: http://www.nytimes.com/2009/08/30/magazine/30doctors.html?_r=1&pagewanted=print)
- **Dr. Lucy Shapiro**, Virginia and DK Ludwig Professor in the Department of Developmental Biology, will be honored at the commencement ceremony of the Albert Einstein College of Medicine, where she will be presented the Distinguished Alumna Award.
- **Dr. Karl Blume**, Professor of Medicine, Emeritus, has been selected by the European Group for Blood and Marrow Transplantation (EBMT) for an award and Honorary Membership for his outstanding activities and contributions to stem cell transplantation and to education.
- **Dr. Tom Raffin**, the Colleen and Robert Haas Professor of Medicine (Pulmonary Medicine), Emeritus, and **Dr. David Magnus**, Professor of Pediatrics (Bioethics), shared an honor on April 15th thanks to the generosity of the Haas family. In 1999 Dr. Raffin was named to the Haas Professorship with the recognition that, when he became emeritus, the professorship would be named in his honor. He became emeritus in 2009, and the Thomas A Raffin Professorship was established in Bioethics. I am pleased to announce that Dr. Magnus is the first incumbent. Drs. Raffin and Magnus, along with their families, friends and colleagues, shared this joint honor with Colleen and Robert Haas at a wonderful event on April 15th. Much appreciation and congratulations to all.

Appointments and Promotions

Marilyn West Butler has been promoted to Clinical Professor of Surgery, effective 9/01/10.

Lisa Chamberlain has been reappointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 6/01/10.

Angela E. Chen has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 4/01/10.

Mark L. Cohen has been reappointed to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 9/01/09.

Alejandro Dorenbaum has been reappointed to Clinical Associate Professor of Pediatrics, effective 12/01/09.

Jerome Jay Gabriel has been appointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 5/01/10.

Brenda Golianu has been promoted to Associate Professor of Anesthesia at the Stanford University Medical Center, effective 4/01/10.

Peter W. Gregor has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/01/09.

Odette Harris has been appointed to Associate Professor of Neurosurgery at the Stanford University Medical Center, effective 4/01/10.

Stefan Heller has been promoted to Professor of Otolaryngology – Head and Neck Surgery, effective 4/01/10.

Jeanette Hsu has been appointed to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 4/01/10.

Nishita Kothary has been reappointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 4/01/10.

William T. Kuo has been reappointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 5/01/10.

Gary Lee has been reappointed to Clinical Associate Professor (Affiliated) of Medicine, effective 9/01/09.

Gordon K. Lee has been reappointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 5/01/10.

Billy W. Loo has been appointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, effective 4/1/10.

John D. Louie has been promoted to Clinical Assistant Professor of Radiology, effective 7/01/10.

Arnold Milstein has been appointed to Professor of Medicine, effective 4/01/10.

Kristen Nord has been reappointed to Clinical Assistant Professor (Affiliated) of Dermatology, effective 9/01/09.

Jean-Marc Olivot has been promoted to Clinical Assistant Professor of Neurology and Neurological Sciences, effective 5/01/10.

Ronald A. Schuchard has been appointed to Clinical Associate Professor (Affiliated) of Neurosurgery, effective 4/01/10.

Neil Schwartz has been reappointed to Clinical Assistant Professor of Neurology and Neurological Sciences and of Neurosurgery, effective 5/01/10.

Akshat Shah has been appointed to Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 4/01/10.

Frederick J. Van Rheenen has been reappointed to Clinical Professor of Medicine, effective 3/01/10.

Anthony J. Ricci has been promoted to Professor of Otolaryngology – Head and Neck Surgery, effective 4/01/10.

Cornelia M. Weyand has been appointed to Professor of Medicine, effective 4/01/10.

Ira G. Wong has been reappointed to Clinical Professor of Ophthalmology, effective 1/01/10.

Dean's Newsletter

May 3, 2010

Employee Recognition Day Celebrates Why Stanford is Such a Great Institution

Virtually every day our media services carry announcements of the contributions of our faculty, students and trainees in science and medicine. These contributions are often remarkable; they have helped transform knowledge and have created new tools to diagnose, treat or prevent human disease. Indeed, our faculty are among the most lauded in the world, having received the highest amount of peer-reviewed funding per person in the country, along with a disproportionate share of prestigious awards and memberships in distinguished societies and foundations such as the Howard Hughes Medical Institute, the National Academy of Sciences, Institute of Medicine among others. And while these accolades are well deserved, none would have been possible without the dedicated commitment and support from the outstanding staff who bring vibrancy, intelligence, diligence and success to the Stanford community. These individuals carry out key experiments, support students and trainees, participate in our clinical care mission, oversee veterinary services, provide administrative support and help connect our community over time and space. Indeed, many of our valued staff have worked at Stanford for decades – some even 40 years or more.

On April 16th we celebrated the hundreds of staff who have worked at Stanford for five or more years in a festive recognition event held in the new conference center in the Li Ka Shing Center for Learning and Knowledge. In particular we noted the 65 staff members who have worked at Stanford for more than 20 years, including Tom Nozaki, who has logged in 40 years of service, and Beverly Bonfert, Jane Eaton and Pamela Petrie, who have each served for 35 years (<http://med.stanford.edu/employeeerecognition/>). We also celebrated fifteen staff who have

worked at Stanford for 30 years and whose bios can be found at <http://med.stanford.edu/employeeRecognition/honorees/30years/>. Also highlighted are the 21 individuals who have worked here for 25 years (see: <http://med.stanford.edu/employeeRecognition/honorees/25years/>) and the 35 who have been members of our community for 20 years (see: <http://med.stanford.edu/employeeRecognition/honorees/20years/>).

In addition to honoring our employees, we also celebrated the two individuals who were named by their colleagues as the recipients of the 2010 Spirit Award. This is the 10th year that this award has been given to individuals who embody consistent dedication, initiative, motivation, positive attitude and service to those whom they support or interact with. This year's awardees are:

- **Katie Allen**, Administrative Associate in the Department of Surgery and its Division of Multi-Organ Transplantation.
- **Jeff Melton**, Information Systems Manager in the Department of Medicine and the Stanford Prevention Research Center

Ms. Allen's and Mr. Melton's bios can be viewed at <http://med.stanford.edu/employeeRecognition/spirit/>. Please join me in congratulating them and in thanking all of our Stanford Medical School employees.

Thinking About Learning: Now and the Future

As we begin outfitting the new Li Ka Shing Center for Learning and Knowledge (LKSC) for the coming academic years, many will celebrate the state-of-the-art programs we will be putting into place. I am certainly proud of our accomplishments and grateful to all who have made these successes possible. However, I find myself already thinking about the future and how we can get ready to leap beyond our current (even though not even yet fully installed) technologies into the world that will await us 10-20 years from now. The medical and graduate students who will join Stanford in 2020 and beyond (if not even sooner) will be the recipients of knowledge yet to be created. It is inevitable that their learning styles will be different from those of today's students. They will no doubt pose challenges and opportunities for how we educate them and for the settings that will be necessary to optimize learning. We all recognize that knowledge content will evolve rapidly. But we are just at the cusp of watching the tools of education change dramatically.

For example, as I complete the final editing of the sixth edition of one of the textbooks I have edited for the past two decades, I am keenly aware that these large paper bound compendiums will give way to digitized formats in the future. Indeed, most knowledge content will soon be carried in hand held devices and searches into large data storehouses will replace the shelves of journals and books of our medical libraries. In fact, they already have. These changes are already self-evident. Less clear is how students who have grown up with these technologies will learn and how we can engage them most successfully. There is also the need to balance highly technologically driven learning tools with the very real need of sustaining – and enhancing –

humanism and professionalism as part of the medical school curriculum and lifetime learning journey. This continuum, which will begin in high school (if not earlier), will continue throughout the life of the physician and scientist, and it is time to start to envision those changes, many of which will occur incrementally— and some of which we cannot even begin to imagine.

To begin preparing for the future I am initiating a planning process that will focus discretely on medical student, graduate student and postdoctoral scholar education and learning with the goal of aligning them along a continuum as the planning process unfolds. Each of these planning efforts will commence with a mini-think tank that we will hold this summer. This will be followed by more focused task force explorations in the fall with the goal of bringing the dialogue together in time for our Leadership Retreat in February 2011. Some of the questions we will address are extensions of the challenges and opportunities I highlighted in my January 11, 2010 Dean's Newsletter (see http://deansnewsletter.stanford.edu/archive/01_11_10.html). These questions will be amplified and supplemented by issues now arising as we prepare to open the LKSC. Most importantly they will be guided by “unknowns” we will try to envision for the future. We will do our best to progressively engage broad participation in this dialogue and I will certainly do my best to keep you apprised in future issues of the Newsletter.

Invitation to the May 12th Open House for the Li Ka Shing Center for Learning and Knowledge

The Li Ka Shing Center for Learning and Knowledge (LKSC) will open its doors for a sneak peak at the new spaces and programs during a one day "Teaching and Learning Open House" on May 12th from 10am-3pm (<http://lksc.stanford.edu/openhouse/>). Since the building will not be fully operational until August 16th, this is a unique chance to see the teaching spaces and the simulation areas prior to fall quarter. This will be one of the only opportunities for staff and faculty to see the spectacular views from the student-only 4th floor Yeung Family Rooftop Patio and the Berg Family Commons as well as the other teaching and learning spaces that make the LKSC one of the most remarkable centers in the world.

Visitors to the May 12th Open House will be able to take a self-guided tour through all of the key areas of the building. Each area will highlight a unique program including:

- The Immersive Learning Center on the Ground Floor
- The high-tech class room facilities on the First Floor
- The incredible and highly flexible Conference Center and class rooms on the Second Floor
- The Dean's Office Suite and class rooms on the Third Floor
- The Student Commons, including exercise facility and study rooms on the Fourth Floor

We look forward to welcoming you to the LKSC on Wednesday, May 12th from 10 am – 3pm.

Alumni Visit Stanford and the LKSC

Saturday, May 1st was Alumni Day for the School of Medicine. The theme of the day,

“Transforming Medical Education,” honored medical school graduates from the era when the school was housed in San Francisco, those who graduated over the 50 years that have passed since the school joined the campus of Stanford University and, in anticipation, future generations of graduates epitomized, in part, by the new Li Ka Shing Center for Learning and Knowledge (LKSC). Alumni graduating in the 1940’s and 1950’s to the present attended sessions on medical education featuring presentations by leading faculty followed by tours of the LKSC. The enthusiasm and excitement of the alumni was palpable – as was their pride in Stanford Medicine past and future.

In addition to thanking all of our faculty speakers, I want to add my deep appreciation to the exceptional work done by our Office of Medical Development in planning and coordinating the alumni events – of course in conjunction with the Stanford University Medical Center Alumni Association. Thanks to all!

Thanks from Haiti’s Hôpital Albert Schweitzer

Immediately after the horrific earthquake that devastated Haiti and especially its capital city of Port au Prince on January 12th, relief teams from Stanford (see: <http://med.stanford.edu/ism/2010/february/haiti-follo-0208.html> and http://deansnewsletter.stanford.edu/archive/02_22_10.html#3) and around the world rushed to bring medical care and other vital resources to the millions of Haitians whose lives had been so dramatically disrupted by this natural disaster. In addition to this emergency relief, communities provided financial support to help rebuild Haiti’s fractured infrastructure – something that was already fragile even prior to the earthquake. Stanford University has played an important role in this relief effort thanks to the vision of Dr. Michele Barry, Senior Associate Dean for Global Health, and other Stanford faculty like Dr. Ralph Greco, Johnson and Johnson Professor of Surgery, who have spent years working in Haiti at the Hôpital Albert Schweitzer. Dr. Barry recommended that dean’s office and departments provide funds that could be matched by students, faculty and staff of Stanford University. Over a 10 day period, this resulted in approximately \$350,000 of funding – a testimony to the generosity and compassion of the Stanford community (<http://med.stanford.edu/ism/2010/february/haiti-donate-0208.html>).

On April 26-27th, Ian Rawson, the Managing Director of Hôpital Albert Schweitzer visited Stanford to offer his thanks and appreciation for contributions that helped the doctors and staff to provide exceptional medical care during the immediate aftermath of the extraordinary crisis. I had the pleasure to meet with Mr. Rawson and want to convey directly to you how much the contributions you provided impacted the lives of individuals who suffered incredible losses and personal devastation. On behalf of the Hôpital Albert Schweitzer, Mr. Rawson wanted me to offer his deepest thanks and appreciation.

AAMC Previews the Changing Face of Tenure in Medical Schools

As we recognize all too well, the last two years have been economically challenging for our nation, our university and our medical school. Despite these challenges, I have also underscored that, compared to many of our peers across the nation, Stanford remains on solid financial footing, although a number of sacrifices and difficult choices have had to be made to sustain our success (see http://deansnewsletter.stanford.edu/archive/12_14_09.html#2). At the same time, it is important to remind ourselves that medical schools remain vulnerable because of their

dependency on competitive sponsored funding for research and income from patient care activities – both of which are impacted by changes in the economic environment. Also vulnerable to the changing economic climate is support from gifts, endowment income, support from foundations and, where applicable, state and other public financing. Accordingly, medical school faculty are largely on “soft money” even though many aspire to “tenure track positions.”

A recent “Analysis in Brief” from the Association of American Medical Colleges, reported that the prospect for tenure with a specific financial guarantee is becoming increasingly uncommon. For example, a 2008 survey of the 111 medical schools that offer “tenure” for their clinical faculty found that 41% had no financial guarantee associated with tenure. Even when a financial guarantee was available, in most cases it was for a base salary. Notably, over the past decade financial guarantees for clinical faculty have been declining, with 38% of schools having no financial guarantee in 2008. This is similarly the case for basic science faculty. Increasingly medical schools are offering “tenure of title” which really amounts to the guarantee of an honorary title at the discretion of the medical college but with no right or expectation of financial support.

At Stanford we plan to continue our tenure policy, which guarantees the base salary for University Tenure Line (UTL) faculty who have been promoted with tenure. Medical Center Line (MCL) faculty may receive their base salary when they have achieved “continuing appointment” status as professor. While we have limited the size of our faculty (compared to virtually all of our peers) we have determined that it is preferable to provide support and financial guarantees for a smaller number of highly successful faculty than to limit or eliminate support in order to have a larger faculty. While this has consequences, I continue to believe it is the most responsible way to protect our faculty and their academic freedom.

Conflict of Interest and Professional Societies

In the evolving context of policies regarding academia-industry relations, the Council of Medical Specialty Societies (CMSS) announced on April 21st its CMSS Code for Interactions with Companies. The Code was developed by a 30 member task force comprised of leaders of member societies, and it includes seven core principles that cover:

- ***Conflict of Interest*** policies and procedures for society activities such as meetings, clinical practice guidelines, journals
- ***Financial Disclosure*** whereby public disclosure of any donations and support received from for-profit companies as well as society Board members’ financial and uncompensated relationships with companies.
- ***Independent Program Development*** that provides publicly available policies and procedures ensuring that educational programs, advocacy positions, and research grants are developed independent of industry support
- ***Independent Leadership*** that prohibits professional society leaders (including presidents, CEOs and editors-in-chief of society journals) from having direct financial relationships with relevant for-profit companies in the health care sector.

The full report and list of signers can be found at www.cmss.org/codeforinteractions.aspx.

Concurrently, an increasing number of pharmaceutical and device industries are publicly listing physicians who have received compensation from them for speaking, consulting and related activities. The increasing transparency of financial relationships between industry and academia as well as between industry and practicing physicians is accelerating at a rapid pace. This represents a fundamental transformation of the murky and sometimes conflicted and intertwined financial relationships of just a couple of years ago. This is an important evolution that marks an important turning point in academia- industry relations. And while it is important to sever ties whereby physicians in academia becoming engaged in the marketing activities of industry, it is also important to foster ways for appropriate non-conflicted ways for physicians and scientists to interact with industry to develop new drugs, devices, diagnostics, etc. This is a goal that I, along with others, am also working to achieve.

Awards and Honors

This past week two of our nation's most prestigious academies announced the election of 2010 members – both of which included faculty in the School of Medicine. They included:

- **Joseph B. Shrager, MD**, Professor of Cardiothoracic Surgery and Chief, Division of Thoracic Surgery, was recently elected to the American Surgery Association, which is the oldest and most prestigious surgical Society. Congratulations to dr. Shrager!
- **Richard Barth, MD**, Professor of Radiology and Radiologist-in-Chief of the Lucile Packard Children's Hospital, was elected President of the Society of Chairmen of Radiology at Children's Hospital (SCORCH) for a 2 year term. Dr. Barth will also serve as a member of the Board of Directors for the Society of Pediatric Radiology. Congratulations to Dr. Barth!
- **The American Academy of Arts and Sciences** elected 229 "leaders in the sciences, social sciences, the humanities, the arts, business and public affairs." Among these are the following Stanford School of Medicine faculty:
 - **Karla Kirkegaard, PhD**, Professor and Chair of the Department of Microbiology and Immunology
 - **Michael Levitt, PhD**, Professor of Structural Biology
 - **Thomas Sudhof, MD**, Avram Goldstein Professor in the School of Medicine and Professor, by courtesy, of Neurological Sciences and Psychiatry and Behavioral Sciences and Member, Howard Hughes Medical Institute
- **The National Academy of Sciences** elected 72 members, four of whom are faculty at Stanford University, including one in the School of Medicine:
 - **Roel Nusse, PhD**, Professor and Chair of the Department of Developmental Biology and Member of the Howard Hughes Medical Institute.

Please join me in congratulating Drs. Kirkegaard, Levitt, Sudhof and Nusse.

Appointments and Promotions

- **Jill A. Helms** has been promoted to Professor of Surgery, effective 5/01/10.

Dean's Newsletter May 24, 2010

Dr. Edward “Ted” Harris Dies Following Long Illness

I am very sad to share the news that Dr. Ted Harris died on Friday May 21st.

Dr. Harris joined Stanford in 1987 as the chair of the Department of Medicine and served the School of Medicine, the University and our nation in numerous and important ways. He was a noted scholar and academician and served as the editor of *Kelly's Textbook of Rheumatology* for each of its eight editions. He was also Executive Secretary of *Alpha Omega Alpha Honor Medical Society* and served as the Academic Secretary to Stanford University. He contributed significantly to the American Rheumatism Association/American College of Rheumatology, serving on the Scientific Committee, Fellowship Committee, Executive Committee, Nominating Committee, as Vice President/President Elect in 1984 and finally as President of the ACR in 1985. He received ACR's Presidential Gold Medal, the Society's highest honor, in 2007.

He also served on the board of Governors of the American College of Physicians and was named a Master in the ACP. In addition to his personal contributions as a clinician, investigator, scholar and leader, Ted was the mentor to generations of physicians and rheumatologists, supporting their careers and personal development. He will be deeply missed by his family, children and grandchildren – as well as his family at Stanford. A memorial service will be planned for this summer and I will let you know the details when they are available. In the meantime, we offer our condolences to the many friends, family and colleagues of Dr. Ted Harris

Dr. Arnold Milstein Will Lead New Center on Clinical Quality and Effectiveness

The long debate on healthcare ultimately focused on and made some strides in health-insurance reform, but did relatively little to address healthcare delivery and its related costs. While it is almost certain that further legislation focusing on healthcare reform is not likely to occur in the immediate future, there are opportunities for institutions and communities to explore avenues for innovation around the legislation that has just passed. While cognizant of the enormous challenges that lie ahead, I believe that the unique community of excellence that exists at Stanford offers special opportunities for helping to shape the future reform of healthcare delivery and beyond. Ultimately this will depend on individual leaders, innovative research and education, and important changes in culture that address how we care for patients in the hospital, ambulatory settings, at home and in their communities.

Within this broad context I am pleased to announce that in conjunction with Stanford Hospital &

Clinics (SHC) we will be establishing a new initiative that will be led by Dr. Arnold Milstein, who will join Stanford on July 1st as Professor in the Department of Medicine and Director of the Clinical Excellence Research Center. Dr. Milstein is nationally recognized and acclaimed as an expert in healthcare policy and delivery and is a champion of the view that accelerating the rate of high-value clinical service innovations is the key to offsetting the cost-additive impact of population aging and valuable biomedical technology innovations.

An economics graduate of Harvard, Dr. Milstein received his MD degree from Tufts and then trained in Medicine and Psychiatry at UCSF. He also holds an MPH from UC Berkeley with a focus on health care evaluation. During his distinguished career, which has been recognized by his election to the Institute of Medicine of the National Academy of Sciences, Dr. Milstein has held a number of distinguished positions while anchored with the Mercer Consulting Group, where he has served in various capacities, including Chief Physician and US Health Care Thought Leader, since 1992. Among the numerous positions he has held, he has been Chair and Founding Steering Committee Member of the IHA Physician Group Pay for Performance Program, US Congressional Member to the National Quality Forum, Commissioner in the Medicare Payment Advisory Commission (MedPAC) to the US Congress, Board Member of the AHRQ National Quality Measures Council, Policy Advisory Committee to the RAND ACOVE Study, Co-Founder, Medical and Scientific Director for the Consumer-Purchaser Disclosure Project, Member of the National Quality Forum Strategic Advisory Council and Measure Priority Workgroup, and Co-Founder and Leaps and Measures Measurement Committee Chair of The Leapfrog Group. He has also served as an Associate Clinical Professor at UCSF. Of interest, his recent research led to the formulation and current multi-state testing of "ambulatory care ICUs" (A-ICUs) and "Dx-Rx Pairing." An A-ICU is a new form of ambulatory care expressly designed to prevent costly and dangerous health crises among patients with severe chronic illness. Dx-Rx Pairing tailors a patient's cost-sharing among medication options that offer an equally favorable expected health outcome based on the comparative cost-effectiveness of each medication in treating a patient's specific medical conditions. He is also a leader in the exploration of the value of extending such patient-specific tailoring to a patient's behavioral and genetic risk factors.

In his new position at Stanford, Dr. Milstein will establish a new research center dedicated to accelerating innovations in health care delivery in the US and globally that improve the societal value of health care. Importantly, he will develop and lead a research collaboration of faculty from the university's business, engineering and medical schools as well as Stanford Hospital & Clinics that will focus on use of trans-disciplinary research teams to accelerate the discovery, testing and replication of high value innovations in health care delivery. The collaboratives will also focus on the discovery and refinement of clinical service innovations that produce more health and patient satisfaction and also lower annual per capita health care spending.

Dr. Milstein's appointment and the creation of the new Clinical Excellence Research Center, supported jointly by Stanford Medical School and Stanford Hospital & Clinics, comes at a time of incredible challenge and opportunity. In the wake of the first major legislation on healthcare, Stanford has the opportunity to be truly innovative. This comes at a time when the Medical Center has made considerable progress in its clinical quality initiatives (although much work remains) and is initiating new programs to address the patient experience in multiple dimensions.

It also comes at a time when students and trainees are increasingly interested in and focused on the quality and delivery of care. And it comes at a time when major national academies – including the Institute of Medicine and the National Academy of Engineering – are exploring the ways that engineering and management science can contribute to health care delivery reform. Importantly, it also comes at a time when the National Institutes of Health has announced its commitment to support and fund new ventures in the science of health care delivery, and when support for clinical effectiveness research has reached a high-water mark.

With the interests and talents of our students and trainees and the creativity and knowledge of faculty across the University, the prospect that Stanford and our new Clinical Excellence Research Center can assume a leadership role is incredibly exciting. Having a thought leader and scholar such as Arnie Milstien at the helm of this new initiative offers promise of future insights and innovations that truly can help to transform healthcare delivery.

Navigating the Healthcare Reform Legislation

Much has been spoken, written, claimed, refuted and debated about the *Patient Protection and Affordable Care Act* that was signed into law by President Obama on March 23, 2010. Like many of my colleagues I have been involved in various aspects of this process – but like virtually all, I find the scope of what has been placed in legislation daunting to assimilate given its breadth and somewhat patchwork nature. It is still a stretch to say that this legislation defines a “healthcare system” for the United States. But it does focus on various aspects of health insurance reform – both public and private – and has major implications for virtually every component of the healthcare industry and enterprise that will unfold in its current or amended form between 2010 and 2015 and beyond. Except for the fact that new legislation requires most US citizens and legal residents to have health insurance and that it creates state-based “American Health Benefit Exchanges”, its wide-ranging components do not lend themselves to simplification or easy sound bites. Moreover it contains features and components that might not be expected or that are even surprising – consistent with the legislative process through which the bill was configured.

I doubt that many healthcare providers or leaders have (or will) fully read the legislation, or have a full command of all that is to unfold over the next years – in part because of its inherent intricacies and nuances and also in anticipation of the changes, modifications and amendments that are also likely to occur through the political and legislative process. That said, a helpful summary of the *Patient Protection and Affordable Care Act* has been put together by the *Kaiser Family Foundation* and is available on its website (see: <http://www.kff.org/healthreform/upload/8061.pdf>). The summary has helpful content for the various (and many) components of the legislation. To give you a greater sense of the range of topics and policies that are included in the legislation I will list the key headings (following the Kaiser Foundation summary) and include some of the subheadings. You can consult the website for additional details – but even this outline will give a greater sense of the scope of the topics that are included in the legislation.

- **Individual Mandate**
 - Requirement to have coverage
- **Employer Requirements**

- Requirements to offer coverage
 - Other requirements
- ***Expansion of Public Programs***
 - Treatment of Medicaid
 - Treatment of CHIP
- ***Premium and Cost-Sharing Subsidies to Individuals***
 - Eligibility
 - Premium credits
 - Cost-sharing subsidies
 - Verification
 - Subsidies and abortion coverage
- ***Premium Subsidies to Employers***
 - Small business tax credits
 - Reinsurance program
- ***Tax Changes Related to Health Insurance or Financing Health Reform***
 - Tax changes related to health insurance
 - Tax changes related to financing health reform
- ***Health Insurance Exchanges***
 - Creation and structure of health insurance exchanges
 - Eligibility to purchase in the exchanges
 - Public plan option
 - Consumer Operated and Oriented Plan (CO-OP)
 - Benefit tiers
 - Insurance market and rating rules
 - Qualifications of participating health plans
 - Requirements of the exchanges
 - Basic health plan
 - Abortion coverage
- ***Benefit Design***
 - Essential benefits package
 - Abortion coverage
- ***Changes to Private Insurance***
 - Temporary high-risk pool
 - Medical loss ratio and premium rate reviews
 - Administrative simplification
 - Dependent coverage
 - Insurance market rules
 - Consumer protections
 - Health care choice compacts and national plans
 - Health insurance administration
- ***State Role***
- ***Cost Containment***
 - Administration simplification
 - Medicare
 - Medicaid
 - Prescription drugs

- Waste, fraud, and abuse
- ***Individual Quality/Health System Performance***
 - Comparative effectiveness research
 - Medical malpractice
 - Medicare
 - Dual eligibles
 - Medicaid
 - Primary care
 - National quality strategy
 - Financial disclosure
 - Disparities
- ***Prevention/Wellness***
 - National strategy
 - Coverage of prevention services
 - Wellness programs
 - Nutritional information
- ***Long-Term Care***
 - CLASS (community living assistance services and supports) program
 - Medicaid
 - Skilled nursing facility requirements
- ***Other Investments***
 - Medicare
 - Workforce
 - Community health centers and school-based health centers
 - Trauma care
 - Public health and disaster preparedness
 - Requirements for non-profit hospitals
 - American Indians
- ***Financing***
 - Coverage and financing
 - Sources of information: www.democraticleader.house.gov/

Although there are many provisions in the recently passed legislation, there are also significant gaps that will need to be addressed over the coming years. One of these is healthcare delivery reform, an important topic that I have addressed earlier in this Newsletter. Further, it is important to be aware that even the legislation that has been passed will be phased in over five or more years. Even though a number of insurance reforms and changes in Medicare and Medicaid go into effect in 2010, more are phased in over the next several years. The Kaiser Family Foundation chronology is also helpful on this timeline and can be viewed at: <http://www.kff.org/healthreform/upload/8060.pdf>

Dr. Atul Gawande will be the 2010 Medical School Commencement Speaker

I am very pleased to announce that Dr. Atul Gawande will be the School of Medicine's 2010 Commencement Speaker on Saturday, June 12th beginning at 2 pm on the Dean's Lawn under the "big tent." While the University Commencement ceremony will be held on the morning of

Sunday, June 13th, we have found it important to hold our certificate event on Saturday since a number of our graduates leave for residency orientation sometime over the weekend.

Given that 2010 is the year of “healthcare reform,” the fact that Dr. Gawande will be our commencement speaker is particularly relevant and meaningful. A number of his writings have played a major role in the healthcare debate, particularly his June 2009 article in *The New Yorker* magazine entitled – “The Cost Conundrum,” which was recommended as required reading by President Obama (see: http://doclibrary.com/MSCL49/DOC/Cost_Containment_Article_NewYorker_6.1.092050.pdf).

Atul Gawande is no stranger to Stanford, having been an undergraduate and Rhodes Scholar from the Farm. Following his studies at Balliol College, Oxford he attended Harvard where he received an MD degree as well as an MPH. He trained in surgery at the Brigham and Women’s Hospital and is currently an Associate Professor of Surgery at Harvard Medical School as well as an Associate Professor in the Department of Health Policy at the Harvard School of Public Health. His range of knowledge and talents is broad and legendary and include clinical medicine, quality and effectiveness and health policy and global health. He has served as an advisor to presidents and national leaders and has won national acclaim for his thought-provoking writings and essays and highly regarded books including “*Complications: A Surgeon’s Notes on an Imperfect Science*” (2002), “*Better: A Surgeon’s Notes on Performance*” (2007) and “*The Checklist Manifesto: How to Get Things Right*” (2009). He became a MacArthur Fellow in 2006.

Of course commencement is about our graduating students and their families and they should be our primary focus and cause for celebration. But I am confident their experience will be enriched by Dr. Atul Gawande’s commencement address and its relevance to emerging landscape of health looming before us.

The CEO Position for Stanford Hospital & Clinics

As you know, the search is underway for the President and CEO of Stanford Hospital & Clinics (SHC) to succeed Martha Marsh, who is retiring from her position on August 31st after more than eight years of service. The Search Committee is being co-chaired by Mariann Byerwalter and John Scully, both members of the SHC Board of Directors (Ms. Byerwalter is chair of the Board and they are both University Trustees). Among the search committee members are Dr. Steve Galli, chair of the department of Pathology and Dr. Bill Maloney, chair of Orthopaedic Surgery who were chosen to represent the clinical chairs. I also am serving on the Search Committee.

The Search Committee has defined some of the key characteristics of the future CEO position – based on input from leaders across the hospital, medical staff, university and community. Recently, the SHC Chief of Staff Bryan Bohman distributed some of these fundamental characteristics to the SHC Medical Staff. For completeness, I am communicating to you the same “major elements” of the position that were distributed to the medical staff this past week. They include:

The general role of the SHC CEO, reporting to the SHC Board of Directors is as follows:

- The CEO will be challenged by a highly competitive market, a dynamic health care environment and the responsibility for achieving a standard universally associated with the Medical School and the University at large;
- It is anticipated that the new executive will initially focus on: leading the development and implementation of a well-defined strategic plan that is coordinated with the School of Medicine and charts a path for clinical excellence in its local and extended market while meeting objectives related to education, research and community service; continuing to maintain or exceed a level of financial performance required to meet the hospital's on-going obligations across its broad mission; overseeing the successful completion of the new hospital; and building productive relationships with all key stakeholders.
- Some of the specific responsibilities that have been identified for the position include:
- Working closely with the Board, Medical School Leadership, Medical Staff Leadership and Senior Management, develop an integrated strategic plan for SHC, which plan should include a definition of the organization's position in the local and extended market and the development of associated strategies aimed at achieving annual and long-term quality, service, and financial performance;
- Create, communicate and reinforce a vision for operations that emphasizes the delivery of quality clinical care, service, and integrity;
- Maintain and continue to improve SHC's operational and financial performance;
- Provide leadership to the organization's fundraising efforts and build strong and trusted relationships with a complex array of institutions and individuals;
- Continue to identify opportunities to advance the culture of service and clinical excellence by setting the highest standards for all personal interactions and care;
- Create and execute strategies that persuade key stakeholders to take actions that will advance strong interests and business goals;
- Align communications, resources, and processes to ensure that strategic priorities yield sustainable results;
- Participate in the successful identification and implementation of business development initiatives to increase/improve volume, financial performance and patient service opportunities;
- Work with the Dean of the School of Medicine and Clinical Leadership to expand centers of excellence in clinical care and research;
- Work with community physicians and Medical Staff leadership to ensure the continued access of community physicians and their patients to SHC on an equal basis with faculty physicians;
- Establish and effectively manage on-going relationships with primary constituents;
- Attract, retain and develop top talent;
- Communicate openly and effectively, internally and externally, with a wide variety of constituents to ensure their needs are being met and to ensure the enhanced reputation of SHC.

It is important to note that executive searches require a thoughtful process and a very high degree of confidentiality to protect institutions and individuals. Thus the specifics of the search process are confidential but I am certain that they will be conducted with the highest professionalism, care, precision and timeliness

The School of Medicine Defines Its Presence, Opens Its Doors, and Celebrates Its History

On May 12th the doors to the Li Ka Shing Center for Learning and Knowledge (LKSC) opened to our Stanford community and to our students specifically (see:

<http://med.stanford.edu/ism/2010/may/lksc-main-0510.html>). It was a grand celebration that brought years of planning, challenges and expectations to a notable and meaningful fruition. Certainly in my mind the LKSC creates a new presence for the School of Medicine and offers a multifaceted setting for learning and interaction that makes Stanford truly unique. It stands at the intersection between research and discovery and our major clinical programs and settings. Most importantly it creates a home for our medical and graduate students – for learning, knowledge-seeking, intellectual and social interaction, quiet reflection as well as physical and emotional health and well-being. The LKSC offers a new chapter in the history of Stanford Medicine and opens its doors to a world in which innovation, discovery, technology and humanism will merge to forge tomorrow's physicians and scientists.

While the LKSC is designed to look forward, it is also important to acknowledge and indeed celebrate the individuals, innovations and programs that have created our notable past. Although a number of institutions spend too much time focused on past accomplishments, Stanford almost ignores its past in its efforts to shape the future. While I certainly prefer looking forward, I also believe that some balance is needed to anchor that future. With that in mind, we are now also about to begin revealing the *Stanford Medical Narratives Project* that has been underway during the past couple of years. You will soon be able to visit and hopefully celebrate the history of Stanford Medicine that will be illustrated on some 347 black granite panels that will surround the planters and seating areas along the new Discovery Walk that runs in an east-west direction from the Clark Center past the Fairchild Science Building, the Li Ka Shing Center for Learning and Knowledge, the Beckman Center, through the Lorry Lokey Stem Cell Research Building (SIM1) and CCSR (the Center for Clinical Sciences Research) and beyond. The Medical Narratives Project features the stories, accomplishments and events that began with Elias Cooper in 1858 and that led to the founding of Stanford Medical School in 1908. Based on conversations and reflections from over 100 faculty, students and staff, the Medical Narratives Project details major events in Stanford's missions in education, research and patient care. The project has been developed and shaped by visual artist Susan Schwartzenberg, and landscape artist Tom Leader Studio. My hope is that it will add yet another dimension to our new landscape and evolving new campus, linking our past, presence and future.

Evolution of Academic Medicine in South America and Beyond

On May 20-21 the Association of the Academic Health Centers, where I serve as Chair of the Board of Directors, held its annual international meeting in Sao Paulo, Brazil. The goal of the AAHC International meetings is to bring together leaders of academic centers from different cultures, nations and experiences to exchange experiences as well as opportunities and challenges. Past AAHC International meetings have been held in Asia and Europe. This was the first such meeting in South America and it focused primarily on Brazil along with selected participation for Ecuador and Mexico as well as Canada, the United Kingdom and Europe as well as Australia.

Of course there are major differences in the healthcare and academic systems in different nations and regions (including within the USA). And while it is true that academic medical centers in the USA have been well established (at least in principle) for over a century, it is also true that there is considerable variation in the size, scope, sources of funding, blend of missions and local, regional and national impact among the now 135 academic medical centers in the United States. I reviewed many of the fundamental elements of the USA experience in my plenary session, pointing out the unifying themes (education, research and patient care) but also how and why they differ from each other even within the USA. I also illustrated how academic centers are likely to evolve and change during the era of health insurance (and hopefully healthcare provider) reform, constraints on funding for research and a global down in economics.

At the same time, it was notable to learn at the meeting in Brazil that despite some dramatic differences and expectations, academic medical centers – whether in Europe, Latin and South America, Australia and the United States - share together a common struggle to balance the competing demands of teaching, especially clinical education, against the pressures of delivering patient care. Payment to clinical faculty for medical student and graduate education teaching is virtually always limited, and is counterpoised by pressures to generate patient volume, activity and clinical revenue. Outside of the USA, clinical faculty work part time for their university or teaching hospital, and spend the rest of their time in a private practice setting – with all the tensions and challenges one would expect between these competing masters.

I was also struck that regardless of the culture or region of the world, there is considerable discussion underway on how to better assure the commitment to professionalism, compassion and humanism of students entering the medical profession. Most every country uses standardized metrics to determine admission to medical school (except in certain Latin American countries where “open enrollment” is in place). But all seek to balance factual learning with the imbuing skills of professionalism and humanism and, in concert, work to identify individuals who are likely to engage in unprofessional conduct of behavior. While there is no easy formula, it was of interest to take note that medical schools large or small from different world regions are seeking ways to elevate the practice of medicine and its value to the community. That is very encouraging indeed.

Berry Fellowship Applications

Applications are now being accepted for the Walter V. and Idun Berry Postdoctoral Fellowship for 2010-2011. In establishing the fellowships, the Berrys sought "to benefit humanity through advancing and expanding the understanding of children's health and disease in both the clinical and basic medical sciences." Over the past twenty years, this has been a highly successful program with a specific focus on children's health. The fellowship provides an annual support of up to \$55,000 over twelve months as either stipend or salary, guaranteed for the first of a three-year award period. Funding may be used for health insurance coverage. An additional sum of \$5,000 per year is awarded to offset fellow-related laboratory expenses.

Applications are accepted from individuals interested in pursuing post-residency or postdoctoral training in the clinical or basic medical sciences aimed at advancing and expanding our

understanding of children's health and disease as defined in the broadest sense, under the mentorship of a faculty member at the Stanford University School of Medicine. Information about the fellowship, including eligibility, application guidelines, selection process and funding policy may be found online <http://postdocs.stanford.edu/berry/>. The deadline for applications is June 15, 2010 at 12 noon.

Awards and Honors

- **Dr. Richard A. Barth**, Professor of Radiology, received the Presidential Recognition Award of the Society for Pediatric Radiology, recognizing outstanding contributions to the Society for Pediatric Radiology. The award was received in Boston, MA, on April 17th. Dr. Barth was also elected Second Vice President of the Society for Pediatric Radiology in 2010, and is in line to serve as the Society President in 2013.
- **Dr. Patrick Brown**, Professor in Biochemistry, is the recipient of the 2010 Association of Biomolecular Resource Facilities (ABRF) Award in recognition of his pioneering work in the development of microarrays, and the diverse applications of this technology in genetic research.
- **Dr. Linda Clever**, Associate Dean for Alumni Affairs as received a number of notable awards including the American Medical Women's Association's Elisabeth Blackwell Medal "for the most outstanding contributions to the cause of women in the field of medicine." This is a wonderful honor and while notable in its own right, Dr. Clever's contributions have been even more transcendent. Please join me in congratulating her.
- **Dr. Steve Galli**, The Mary Hewitt Loveless, MD Professor and Chair of the Department of Pathology has been selected by the University Diversity Committee to receive the Stanford University President's Award for Excellence Through Diversity. During his tenure as department chair and member of the faculty, Dr. Galli has been a true leader in promoting diversity and in mentoring and guiding faculty and trainees. He is an exemplary role model and it is wonderful that his contributions are being recognized and awarded by the University. Please join me in congratulating Dr. Galli.
- **Dr. Daniel Herschlag**, professor of biochemistry, chemistry and chemical engineering, has been awarded the 2010 American Society for Biochemistry and Molecular Biology William C. Rose Award in recognition of his outstanding contributions to biochemical and molecular biological research and a demonstrated commitment to the training of younger scientists. He presented an award lecture titled, "How enzymes work," in April at the 2010 annual meeting in Anaheim, Calif. Congratulations to Dr. Herschlag for this honor.
- **Dr. Beverley Newman**, Associate Professor in Pediatric Radiology, was elected to the Nominating Committee of the Society for Pediatric Radiology in recognition of her national stature and leadership in the field of pediatric radiology.

- **Dr. Suzanne Pfeffer**, Professor in Biochemistry, has been elected president of The American Society for Biochemistry and Molecular Biology (ASBMB), and will serve a two year term from July 2010-June 2012.
- **Dr. Shreyas Vasanawala**, Assistant Professor of Radiology, received the GE Healthcare 2010 Thought Leader award at the Annual Meeting of the International Society for Magnetic Resonance in Medicine in Stockholm, Sweden on May 7th, 2010, for innovation in pediatric MRI.
- The Stanford University Post-Doctoral association (SUPD) announced the two winners of the third annual SUPD Postdoctoral Mentoring Award:
 - **Professor Krishna Shenoy** in the department of Electrical Engineering, School of Engineering, and
 - **Professor Anne Brunet** in the department of Genetics, School of Medicine

This award is the first to recognize excellence in postdoctoral mentoring across Stanford University, and carries a cash prize of \$2500 for each winner. Seventy nominations were received in two rounds, and in addition to the two winners, **Professor James Spudich** in Biochemistry and **Professor Andrew Hoffman** from the Department of Medicine and the Palo Alto Veteran Affairs were recognized with honorable mentions.

The Stanford University Post-Doctoral association hopes that this award and recognition will inspire and encourage additional faculty members both at Stanford and in other universities to engage in effective mentoring and leadership for their students and researchers at all levels of education. For those interested in how to develop and evaluate a postdoctoral mentoring plan, a useful resource is provided in the mentoring plan of the National Postdoc Association: <http://www.nationalpostdoc.org/publications/mentoring-plans/mentoring-plan>

Appointments and Promotions

Suvarna Akki has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 4/01/10.

John F. Chardos has been appointed as Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 5/15/10.

James K. Chen has been promoted to Associate Professor of Chemical and Systems Biology, effective 5/01/10.

Curt P. Comstock has been reappointed as Clinical Associate Professor (Affiliated) of Orthopaedic Surgery, effective 9/01/09.

Dawn C. Duane has been reappointed as Clinical Assistant Professor of Neurology and Neurological Sciences, effective 5/01/10.

Jeffrey Englander has been promoted to Clinical Professor (Affiliated) of Orthopaedic Surgery, effective 5/01/10.

William F. Fearon has been promoted to Associate Professor of Medicine at the Stanford University Medical Center, effective 5/01/10.

Stephanie M. Harman has been promoted to Clinical Assistant Professor of Medicine (General Internal Medicine), effective 5/01/10.

Jill A. Helms has been promoted to Professor of Surgery, effective 5/01/10.

Yasuhiro Honda has been appointed as Clinical Associate Professor of Medicine (Cardiovascular Medicine), effective 5/01/10.

Michael A. Horberg has been promoted to Clinical Assistant Professor (Affiliated) of Medicine (Infectious Diseases), effective 8/01/10.

Gloria L. Hwang has been appointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 5/01/10.

Tonya Kaltenbach has been appointed Clinical Assistant Professor (Affiliated) of Medicine (Gastroenterology and Hepatology), effective 3/01/10.

Patrick J. Kearns has been reappointed Clinical Professor (Affiliated) of Medicine (General Internal Medicine), effective 9/01/09.

Anna Lembke has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 5/01/10.

Michael Z. Lin has been appointed to Assistant Professor of Pediatrics and of Bioengineering, effective 5/01/10.

Ying Lu has been appointed to Professor of Health Research and Policy, effective 5/01/10.

Nubia Medina has been reappointed Clinical Assistant Professor (Affiliated) of Medicine (Primary Care – Family Medicine), effective 11/01/09.

Matthew A. Miller has been appointed as Clinical Assistant Professor of Orthopaedic Surgery, effective 8/15/10.

Sunita Pal has been reappointed as Clinical Assistant Professor of Radiology, effective 5/10/10. **Vyjayanthi Periyakoil** has been promoted to Clinical Associate Professor of Medicine (General Internal Medicine), effective 5/01/10.

Lisa Ann I. Post has been reappointed as Clinical Associate Professor of Psychiatry and Behavioral Sciences (Behavioral Medicine), effective 6/01/10.

Kazuko L. Shem has been reappointed as Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 9/01/09.

Manpreet K. Singh has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Lucile Salter Packard Children's Hospital, effective 5/01/10.

Jane C. Tan has been promoted to Associate Professor of Medicine at the Stanford University Medical Center, effective 5/01/10.

Zachary D. Vaughn has been appointed Clinical Assistant Professor of Orthopaedic Surgery, effective 8/15/10.

Greg Zaharchuk has been reappointed to Assistant Professor of Radiology, effective 10/01/10.

Dean's Newsletter

June 14, 2010

Commencement 2010

Commencement both marks and celebrates an ending as well as a new beginning for students in science and medicine. Each graduate will ultimately have a unique professional portrait resulting from many individual lines of knowledge and experience -- each with a beginning and a termination. How those lines come together shapes the career pathway of each of our students-- and the finished portrait will be the culmination of knowledge and experience acquired over many years. The students who received the MS, MD, and PhD degrees from Stanford on June 13th have completed part of their life journey of knowledge and experience acquisition -- but just a part. Of course we hope that their time at Stanford, individually and collectively, has laid a foundation for lifetime learning. And hopefully that learning and experience acquisition will be broad and deep, critical and analytical, theoretical as well as applied, visionary and innovative as well as practical and relevant.

This year's graduates came to Stanford with highly diversified educational backgrounds and life experiences. All aspired to be doctors and/or scientists, but the careers they will now begin will move them down paths most did not consider or weren't even aware of just a few short years ago.

And if history predicts the future, most will have careers that evolve in packets of change that will result in both predicted and unpredicted outcomes -- which will themselves change over time. This makes the foundational training and education at Stanford so important, since it will serve as the underpinning of various career trajectories that will emerge in the years ahead -- whether in academia, industry, public or private service, and in local or global venues. Without doubt, the knowledge content of the (not too distant) future will replace that acquired by this year's graduates in their years at Stanford. But new insights, even if they lead to radical transformation in our understanding, will be built on prior concepts.

It is our hope that we have prepared our students well for these changes. More importantly, it is my fervent hope that they will lead the changes and shape the future. That is what a Stanford education is about. The degrees conferred on June 13 are punctuation marks in the lives of our graduates-- but they are also opportunities to innovate, create and transform.

This year we are granting 47 Masters in Science degrees, 122 Doctor of Philosophy degrees and 101 Doctors of Medicine degrees. A number of students are recipients of two degrees -- and each is the recipient of a unique opportunity, won through hard and diligent work over many years. We wish each student the very best of success and hope that life is filled with unanticipated opportunities to "make a positive difference" in all domains of life.

Remarks from Commencement Speaker Dr. Atul Gawande

Greetings to the graduating class of 2010. Thank you for inviting me back to this gorgeous place where I'd gone to college and worked in this school's laboratories—and even, in my sophomore dormitory, met my wife. But most of all thank you for letting me be part of this special occasion. To take your place in those folding chairs, you have trod a long road. Many of you have worked for four solid years—or five, or six, or nine. And we are here to declare that, as of today, the twelfth of June, 2010, you officially know enough stuff to be called a graduate of the Stanford School of Medicine. You are Doctors of Medicine, Doctors of Philosophy, Masters of Science. It's been certified. Each of you is now an expert. Congratulations. So why—in your heart of hearts—does it not quite feel that way?

The experience of a medical and scientific education is transformational. It is like moving to a new country. At first, you don't know the language, let alone the customs and concepts. But then, almost imperceptibly, that changes. Half the words you now routinely use, you did not know existed when you started: words like arterial blood gas, nasogastric tube, microarray, logistic regression, NMDA receptor, velluvial matrix.

Okay, I made that last one up. But the velluvial matrix sounds like something you should know about, doesn't it? And that's the problem. I will let you in on a little secret. You never stop wondering if there is a velluvial matrix you should know about.

Since I graduated from medical school, my family and friends have had their share of medical issues arise, just as you and your family will. And inevitably, they turn to the medical graduate in the house for advice and explanation. I remember one time when a friend came with a question. "You're a doctor now," he said. "So tell me: where exactly is the solar plexus?"

I was stumped. It was not anywhere in the textbooks.

"I don't know," I finally confessed.

"What kind of doctor are you?" he said.

I didn't feel much better equipped when my wife had two miscarriages, or our first child was born with part of his aorta missing and we had to figure out what to do, or when my daughter had a fall with a dislocated elbow that I failed to recognize, or when my wife tore a ligament in her wrist that I'd never heard of—her velluvial matrix, I think it was.

This is a deeper, more fundamental problem than we acknowledge. The truth is that the volume and complexity of the knowledge we need to master in medicine and science has grown exponentially beyond our capacity as individuals. Worse, the fear is that the knowledge has grown beyond our capacity as a society. When we talk about the uncontrollable explosion in the costs of health care in America, for instance, about the reality that we in medicine are gradually bankrupting the country, we're not talking about a problem rooted in economics. We're talking about a problem rooted in scientific complexity.

Half a century ago, medicine was neither costly nor effective. Since then, however, science has combated our ignorance. It has enumerated and identified, according to the international disease classification system, more than 13,600 diagnoses, 13,600 different ways our bodies can fail. And for each, we've discovered beneficial remedies—remedies that can reduce suffering, extend lives, and sometimes stop a disease all together. But those remedies now include more than 6,000 drugs and 4,000 medical and surgical procedures—and growing. Our job in medicine is make sure all of this capability is deployed, town by town, in the right way at the right time, without harm or waste of resources, for every person alive. And we're struggling. There is no industry in the world with 13,600 different service lines to deliver.

It should be no wonder that you have not mastered the understanding of them all. No one ever will. That's why we as doctors and scientists have become ever more finely specialized and super-specialized. If I can't handle 13,600 diagnoses, well maybe there are fifty of them I can handle—or just one I might focus my research upon. The result, however, is that we each find ourselves to be specialists worried almost exclusively about our particular niche and not the larger question of whether we as a group are making the whole system of care better for people. I think we were fooled by penicillin. When penicillin was discovered in 1929, it suggested that treatment of disease could be simple—an injection that could miraculously cure a breathtaking range of infectious disease. Maybe there'd be an injection for cancer and another one for heart disease. It made us believe that discovery was the only hard part. Execution would be easy. But this could not be further from the truth. Diagnosis and treatment of most conditions require complex steps and considerations, and often multiple people and technologies. The result is that more than forty percent of patients with common conditions like coronary artery disease, stroke, or asthma receive incomplete or inappropriate care in our communities. And the country is also struggling mightily with the costs. By the end of the decade, at the present rate of cost growth, the price of a family insurance plan will rise to \$27,000. Health care will go from ten percent to seventeen percent of labor costs for business, and workers' wages will have to fall. State budgets will have to double to maintain current health programs. And then there is the frightening federal debt we will face. By 2025, we will owe more money than our economy produces. One side says war spending is the problem, the other says it is the economic bailout plan. But take both away

and you've made almost no difference. Our deficit problem—far and away—is the soaring and seemingly unstoppable cost of health care.

We in medicine have watched all this with mainly bafflement—even indifference. This is just what good medicine is like, we're tempted to say. But we'd be ignoring the evidence otherwise. For health care is not practiced the same way across the country. There is remarkable variability in the cost and quality of care. Two communities in the same state with the same levels of poverty and health can differ by more than fifty percent in their Medicare costs. There is a bell curve for cost and quality, and it is frustrating—but also hopeful. For those getting the best results—the hospitals and doctors measured to be at the top of the curve for patient outcomes—are not the most expensive. They are sometimes among the least.

Like politics, all medicine is local. The systems of care we are in matter. One essential characteristic of medicine is it requires the successful function of systems—assemblages of people and technologies. Among our most profound difficulties is making them work. If I want to give my patients the best care possible, not only must I do a good job but a whole collection of diverse components must somehow mesh together effectively. Health care is like a car that way. In both cases, having great components is not enough.

We've been obsessed in medicine with having great components—the best drugs, the best devices, the best specialists—but we've paid little attention to how to make them fit together well. Don Berwick of the Institute for Healthcare Improvement has noted how wrongheaded this is. "Anyone who understands systems will know immediately that optimizing parts is not a good route to system excellence," he says. He gives the example of a famous thought experiment of trying to build the world's greatest car by assembling the world's greatest car parts. We connect the engine of a Ferrari, the brakes of a Porsche, the suspension of a BMW, the body of a Volvo. "What we get, of course, is nothing close to a great car; we get a pile of very expensive junk." Nonetheless, in medicine, that's exactly what we have done.

Earlier this year, I received a letter from a patient named Duane Smith. He was a thirty-four-year-old assistant grocery store manager when he had a terrible head-on car collision that left him with a broken leg, pelvis, and arm, both lungs collapsed, and uncontrolled internal bleeding. The members of his hospital's trauma team went swiftly into action. They stabilized his fractured leg and pelvis. They put tubes in both sides of his chest to re-expand his lungs. They gave him blood and got him to an operating room fast enough to remove the ruptured spleen that was the source of his bleeding. He required intensive care and three weeks of hospital recovery to get through all this. The clinicians did almost every single thing right. Mr. Smith told me he remains deeply grateful to this day for the people who saved him.

But they missed one small step. They forgot to give him the vaccines that every patient who has his spleen removed requires, vaccines against three bacteria that the spleen usually handles. Maybe the surgeons thought the critical care doctors were going to give the vaccines, and maybe the critical care doctors thought the primary care physician was going to give them, and maybe the primary care physician thought the surgeons already had. Or maybe they all forgot. Whatever the case, two years later he was on a beach vacation when he picked up an ordinary strep

infection. Without the vaccines, the infection spread rapidly throughout his body. He survived but it cost him all his fingers and all his toes.

It was, as he summed it up in his note, the worst vacation ever.

When Duane Smith's car crashed, he was cared for by good, hardworking people. They had every technology available to them. But they did not have an actual system of care. And the most damning thing is that no one learned a thing from this. The story of this man made no difference to anyone. For we have since had the exact same story occur in Boston with an even worse outcome. And I am certain it has happened here, too. Indeed, I would bet you that, across this country, we miss the basic, unglamorous step of vaccination in probably half of emergency splenectomy patients.

Why does this happen? Why does anyone receive suboptimal care? After all, society could not have given us people with more talent, more dedication, and more training than the people we have in medical science—than you. I think the answer is: we have not grappled with the fact that the complexity of science has changed medicine fundamentally. This can no longer be a profession of craftsmen individually brewing plans for whatever patient comes through the door. We must be more like engineers building a mechanism whose parts actually fit together, whose workings are finely tuned and tweaked for ever better performance in providing aid and comfort to human beings.

You come into medicine and science at a time of radical transition. You have met the older doctors and scientists who tell the pollsters that they wouldn't choose their profession if they were given the choice all over again. But you are the generation that was wise enough to ignore them. For what you are hearing is the pain of people experiencing an utter transformation of their world. Doctors and scientists are now being asked to recognize a new understanding of what great medicine requires. It is not just the focus of an individual artisan-specialist, however skilled and caring. And it is not just the discovery of a new drug or operation, however effective it may seem in an isolated trial. Great medicine requires the innovation of entire packages of care—with medicines and technology and clinicians designed to fit together seamlessly, monitored carefully, adjusted perpetually, and shown to produce ever better service and results for people at the lowest possible cost for society.

When you are sick, this is what you want from medicine. When you are a taxpayer, this is what you want from medicine. And when you are a doctor or medical scientist, this is the work you want to be part of. It is work with a different set of values from the ones medicine has traditionally had: values of teamwork instead of individual autonomy, ambition for the right process, not just the right technology, and perhaps above all humility—for we need the humility to recognize that under conditions of complexity, no technology will be infallible and no individual will be either. There is always a velluvial matrix to know about.

You are graduating from a special place. And you are joining a special profession. Doctors and scientists, we are all in the survival business, but we are also in the mortality business. Our successes will always be leavened by the limits to knowledge and human capability, by the unstopability of suffering and death. Meaning comes from our each finding ways to help people and communities make the most of what is known and cope with what is not.

This will take science. It will take art. It will take innovation. It will take ambition. And it will take humility. But the fantastic thing is: this is what you get to do.

I've tried to think of how to sum up our task. All I could come up with is: To do cool stuff that lasts. So here is my wish for you, the 2010 graduating class of the Stanford School of Medicine: May you do cool stuff that lasts.

Remarks from Graduate Student Speaker -- Kenneth Randal Schulz, PhD Candidate in Immunology

We are a part of a small subset of people that have willingly chosen to spend the majority of our lives in place that most people cannot wait to leave, the classroom. There are times, be it while staying up all night to cram the night before an exam or when having to collect samples from mice at 2am, when I am sure most of us have temporarily regretted this decision. But for the most part we enjoy this path, and we are all uniquely similar in our thirst for knowledge and passion for science.

But how did we get here? Think back to when you were in 7th grade. Think of how much you changed between the 7th grade and when you graduated from high school. We transformed from scrawny tweens whose only form of transportation was bicycle, into adults who could vote and drive, and who thought they knew it all. That is the same time span that most of us have spent in grad school. It's easy to lose track of the years in the lab, without the landmarks of new teachers and grades each year. However, this was a significant period of time that we have all learned from, struggled through, and finally completed together. And while we may not have grown 6 inches or started the need to shave we have grown in other ways, like wrinkles and gray hairs. Ironically, we may have reverted back from cars to bicycles.

The beginning of graduate school is an experience like none other. We were rounded up from around the country and plopped together, a bunch of new kids in school, all just trying to feel included as we figured out what was going on. But you quickly realize these fellow students just aren't anyone. You are in a nerd mecca, surrounded by a group of super smart people all interested in complex scientific questions most people wouldn't touch with a 10 foot pole. The Biomass camping trip really brought this to light. Where else could you find people discussing the beauty and complexity of meiosis while drinking box wine and making smores? There I met a ton of friends, in and out of my program, including my roommate for the last 3 years. And together we came back to the reality of grad school.

During grad school, we learned a lot of life lessons. In graduate school, you learn how to see a project through from beginning to end, even when there is no real end. We've all learned how to live in the most expensive place in the US while being paid peanuts. We have learned how to smell free food from miles away and how to get it even if it means sitting in on talks that you aren't invited to. We have also learned to push ourselves to get over whatever obstacle is in our way. We've learned to communicate with others about very complex subjects. If you're fortunate like me you have learned how to collaborate and create an environment that is conducive to benefitting everyone involved. Finally, we have learned to deal with vast uncertainty. Unlike that

7th grade classroom, there are no rules set in stone on what one must do to graduate. Life as a graduate student is a bit different.

Compared to simply following a curriculum handed to us, we have to make relatively uninformed decisions about which lab to join, which project to take on, and how to work on that project. It's good preparation for life. Fortunately, through these trials, we've developed tools to assist us deal with these uncertainties. As scientists, we have been trained to think creatively and logically. We have learned how to gather data from a multitude of sources, and we have learned how to analyze that data to make decisions. It's also important to realize that ambiguities are not bad. They provide the opportunity to have a real impact, to make change. Imagine if all of the experiments you needed to do were predetermined for you. What impact, other than providing hands in the lab, would you have on the project? Instead, the best way to proceed is unknown. This gave all of us the opportunity to inject our own creativity to move a project forward. Rather than being given the correct answers, we have discovered the answers. Rather than studying from books, we have done the work that will be in the future textbooks.

We did not acquire these skills by chance. We have gained the qualities, because we have worked hard to do so. We have also had the opportunity to work hard because of the effort put in by the rest of the people in our lives. We should be very grateful of all of the sacrifices made by our parents. The countless hours they spent helping us with school-work, driving us to soccer practice, and motivating us to succeed. The friends that we've had who have always listen when we've had a rough day. Professors, who, by example, teach us how we can teach others and how we can impact lives. Administrators, who make sure that we are paid on time. And finally, our peers. We've been there to help each other, whether it's help with putting together a presentation, creating a distraction to help deal with a rough day, or just being there to sing back-up during Journey's "Don't stop believing" at the karaoke bar. While graduate school has got to be the most humbling experience one could have, it makes it a lot easier when you understand how many great people you have around you. So, thank you all.

Remarks from Medical Student Speaker -- Ian Charlston Chua

To our esteemed faculty, staff, friends, family, and colleagues, good afternoon and welcome! And to my family... I'm sorry for keeping this a secret, but I figured, I didn't need to give you more reason to bring more cameras

Family... indeed, it manifests itself in many ways... there's my biological family now sitting with shocked faces who've always been there for me, even willing to haul a 100 or so mugs from Mexico or willing to welcome and tour my friends around the Philippines... then there's this extended family at Stanford that I've become a part of and will miss dearly.

It was just yesterday that Sumit, Mark and I were in the MSOB cubicle on an interview day discussing how cool it would be if we were all classmates at Stanford Med, and then soon after I found myself recording a Stanford rendition of Titanic on a cruise ship during spring break with them and a dozen other classmates, and now I'm here graduating with them.

Through these 5 years at Stanford, I've come to meet so many great colleagues among them a few opera singers, NASA rocket scientists, seasoned travelers, dancers, pianists, Olympic athletes, and Honduran badminton champions to name a few; only here is climbing mountains

like Kilimanjaro or working in Africa considered "a bit common." I've also seen my entering class and other different Stanford Med classes go through many serious life experiences together whether it be supporting a classmate's family deal with cancer, dealing with divorce, coming out to friends, celebrating weddings, or celebrating the birth of a baby and having a room full of white-coat wearing medical student friends in a labor and delivery suite.

And now we've all transitioned from being nervous premeds starting med school to nervous med students about to start residency; we've all gone from pestering student services for social funds to pestering the financial aid counselors about how we're going to pay off our loans... In a way, we've grown up...

We've all seen each other grow... and we have our mentors, and our loved ones who've been patient with our periodic grumpiness, schedules, and stressful panicking over residency matching to thank. But we also have our colleagues to thank...just like siblings, we've influenced each other and taught each other in many ways and I believe that we will continue to do so for many years to come.

We all started with wanting to partner up with Kunle, Eugene or whomever had bulging, non-missable veins for our first blood draws, then proceeded to watch (and laugh) as we saw each others' horrified faces while we performed our first pelvic exams with certified sexologists who were quite comfortable with their bodies... and by the time we were in clinics, we were consulting each other about patients' or about family members' medical questions.

And today we become doctors... officially. But more specifically, we are Stanford doctors. As scared or nervous as you may be, I hope you realize how awesome you guys are (yes, you class of 2010)... as many doubts you may have about the future, you're stronger, smarter, and more compassionate than you may know, and a lot of people are proud of you.

To you my Stanford colleagues and siblings, I hope you continue to shine and make your Stanford family proud. You've passed your way to an MD and now is the time to show those residency programs what we're made of! But before you go out and win your nobel prizes, I hope you remember the wise counsel of our parent figures here at Stanford, our fantastic advising deans.

First of all, remember to bring your humanity along wherever you go -- we haven't needed honors, medals or awards to motivate us or to certify our worth, let graduating from Stanford mean that we are intrinsically humanistic, compassionate, and pride ourselves in our ability to be empathetic.

Remember the important people in your lives -- it's easy to be stuck in work-mode all the time, but there are people around us who sacrifice a lot and patiently plan their lives around ours...they deserve our attention, gratitude, and love.

Remember where you came from -- it wasn't long ago that we were clinical students, preclinical students, premeds, so as we move up the ranks, don't forget that there are people that look up to us who are looking for inspiration.

Remember that what you do matters -- as low as we may feel on the medical totem pole, and as tired as we may be, just remember that little idealistic premed in each of us that wanted to

change the world... because for our patients, we may be treating the one person that means the world to them... and we are their doctors, their safety blankets, their shoulders to cry on. I hope that as we move away from this place we've called home, and pursue residency, business, fellowship, more fellowships and become urology prostate kings, or the next Dr. Nortons who dare to mess with the pancreas, we'll be able to remember the reason we wanted to become doctors and that moment Dr. Garcia called to say that Stanford saw potential in us. Remember that day that you became part of this sometimes dysfunctional, continuously improving, but always excellent Stanford Medical School Family. In the end, we share both the hard times and the happy times with family, and it is this human connection that matters and keeps us going. We came to Stanford with different stories to tell, and now we leave Stanford with different stories to write, but for the 4, 5 to 10 years that we were here, we were carrying out one script, we now have a shared history... and that makes a family. And so now, let's cherish this day that we close this chapter of our lives and officially become doctors, and let's also celebrate today remembering those who've made sacrifices for us and been there for us. For some, residency may start tomorrow, but today also belongs to them... our family and friends in the audience.

Thank you colleagues for giving me this privilege to speak before you and our loved ones. It has truly been an honor to be part of this family. Thank you.

Faculty Teaching Awards

The Henry J. Kaiser Family Foundation Award for Excellence in Preclinical Teaching:

- **Rita Popat, Ph.D.**, Clinical Assistant Professor, Health Research & Policy - Epidemiology
- **Ellen Porzig, Ph.D.**, Professor (Teaching), Developmental Biology
- **Julie Theriot, Ph.D.**, Associate Professor, Biochemistry; Associate Professor, Microbiology & Immunology

The Henry J. Kaiser Family Foundation Award for Excellence in Clinical Teaching:

- **Craig Albanese, MD**, Professor of Surgery and, by courtesy, of Obstetrics & Gynecology and Pediatrics
- **Rebecca Blankenburg, MD**, Clinical Instructor, Pediatrics - General
- **Yvonne Karanas, MD**, Valley Medical Center, Santa Clara

Arthur L. Bloomfield Award in Recognition of Excellence in the Teaching of Clinical Medicine

- **Yasser El-Sayed, MD**, Professor of Obstetrics and Gynecology
- **Paul Mohabir, MD**, Clinical Assistant Professor, Medicine - Pulmonary & Critical Care Medicine
- **Tracy Rydel, MD**, Clinical Instructor, Medicine - Family & Community Medicine

Alwin D. Rambar-James B.D. Mark Award for Excellence in Patient Care

- ***Philip Sunshine, MD***, Professor Emeritus, Pediatrics - Neonatology

Kaiser Family Foundation Award for Outstanding Innovative Contributions to Medical Education

- ***David Gaba, MD***, Professor, Anesthesia

Franklin G. Ebaugh Jr. Award for Excellence in Advising Medical Students

- ***Bertha Chen, MD***, Associate Professor of Obstetrics and Gynecology and, by courtesy, of Urology

Lawrence H. Mathers Award for Exceptional Commitment to Teaching and Active Involvement in Medical Student Education

- ***Preetha Basaviah, MD***, Clinical Associate Professor, Medicine - General Internal Medicine

Outstanding Lecture/Presentation

- ***Ben Barres, MD, Ph.D.***, Professor of Neurobiology, Developmental Biology and Neurology and Neurological Sciences and, by courtesy, of Ophthalmology

Outstanding Community Preceptor (Pre-Clerkship)

- ***Mina Charon MD***, Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine)
- ***Marina Martin MD***, Clinical Instructor (Affiliated) of Medicine (General Internal Medicine)

Outstanding Community Preceptor (Clerkship)

- ***Jana Mannan MD***, Department of Obstetrics & Gynecology
- ***Kalpna Nathan MD***, Department of Pediatrics

Outstanding Teaching Assistant

- ***Deepa Galaiya***, SMS 2

Stanford University School of Medicine Award for Graduate Teaching

- ***Jennifer Raymond, PhD***, Associate Professor of Neurobiology

Stanford University School of Medicine Award for Outstanding Service to Graduate Students

- **John Huguenard, PhD**, Professor of Neurology and Neurological Sciences and, by courtesy, Molecular and Cellular Physiology

Arnold P. Gold Foundation Humanism and Excellence in Teaching Resident Awards

More than 70 Residents were nominated for this award by clinical medical students and this year, six were selected as awardees, including:

- **Eva Delgado, MD**, Department of Pediatrics
- **Marie Gonella, MD**, Department of Neurology
- **Marie Holapfel, MD**, Department of Obstetrics and Gynecology (Santa Clara Kaiser Medical Center)
- **Tom Nguyen, MD**, Department of Surgery
- **Margie Teng, MD**, Department of Surgery (Emergency Medicine)
- **Shirin Zarafshar, MD**, Department of Medicine

Arnold P. Gold Foundation Humanism Medical Student Honors Society Inductees

This is the first year that Stanford has participated in the Arnold Gold Humanism Honorary Society. Based on the recommendations of a committee comprised of students and faculty, seventeen students were inducted into the Gold Humanism Honors Society. They are:

- **Chris Bennett**, SMS 3
- **James Berbee**, SMS 3
- **Wendy Caceres**, SMS 4
- **John Carter**, SMS 3
- **Tiffany Castillo**, SMS 4
- **Carlene Chun**, SMS 3
- **Michael Galvez**, SMS 4
- **Jonathan Kleinman**, SMS 3
- **Flynn LaRochelle**, SMS 3
- **Elise Min**, SMS 3
- **Kristin Raj**, SMS 3
- **Jamie Rubin**, SMS 3
- **Kierann Smith**, SMS 3
- **Shobha Stack**, SMS 4
- **Michael Sundberg**, SMS 3
- **John Vorhies**, SMS 3
- **Gavitt Woodward**, SMS 4

Medical Student Annual Research Awards

Five students received awards for outstanding poster/abstract presentations from the 27th annual Medical Student Research Symposium on May 13. The following were chosen from the 37 projects presented at the symposium:

- **Nathan Meng**, "Pre-clinical validation of a portable infant warmer using phase-change material not dependent on a continuous external supply of energy." *Mentor: Vinod Bhutani, MD, professor of neonatology.*
- **Paul Nuyujukian**, "A high-performance cortically-controlled motor prosthesis enabled by a feedback control perspective." *Mentor: Krishna Shenoy, PhD, associate professor of electrical engineering.*
- **Hersh Sagreiya**, "Extending and evaluating warfarin pharmacogenetic algorithms using CYP4F2 and rare variants in CYP2C9." *Mentor: Russ Altman, PhD, professor of bioengineering, genetics and medicine.*
- **Jane Whitney**, "Neuropsychological characteristics of children and adolescents at risk for bipolar disorder." *Mentor: Kiki Chang, MD, professor of child and adolescent psychiatry.*
- **R. Tyler Hillman**, "Neuropilins are essential positive regulators of mammalian hedgehog signaling." *Mentor: Matthew Scott, PhD, professor of developmental biology, genetics and bioengineering.*

The Graduates of 2010

The following are the students who received Masters, PhD and MD degrees in 2010. A number of these graduates are dual degree recipients. Again, congratulations to all.

Other Awards and Honors

- ***Dr Tom Sudhof, the Avram Goldstein Professor in the Department of Molecular and Cellular Physiology and Member of the Howard Hughes Medical Institute***, is the 2010 recipient of the *Kavli Prize*. In addition to being an enormously distinguished award, it also includes \$1 million -- making it one of the richest prizes in science. Tom Sudhof is a Member of the Stanford Neurosciences Institute. The other two Kavli Prize recipients in neuroscience are Richard Sheller (now at Genetech) and James Rothman (now at Yale) -- both of whom were previously faculty members at Stanford.
Profile: http://med.stanford.edu/profiles/Thomas_Sudhof/

- **Dr. William T. Newsome, Professor of Neurobiology**, has received this year's prestigious Champalimaud Vision Award for his groundbreaking research into the brain circuitry underlying the mysterious cognitive process that is vision and, ultimately, another equally mysterious process: decision making. He shares the \$1.3 million award-- the largest monetary award in the field of vision science and one of the largest scientific and humanitarian prizes in the world -- with Anthony Movshan, PhD, from New York University.
Prifile: http://med.stanford.edu/profiles/William_Newsome/
- **Lisa Freeman, Director of the VA Palo Alto Health Care System**, is the recipient of the 2010 Distinguished Executive Presidential Rank Award, acknowledging her leadership qualities and performance results. The VA Palo Alto Healthcare System is one of the largest and most complex such facilities in the nation and has the highest Veteran satisfaction scores. Stanford is fortunate to have a close relationship with the VA and with Ms Freeman.
- **Harry Greenberg, MD, the Joseph D Grant Professor and Senior Associate Dean for Research** has been elected a fellow in the American Academy of Microbiology -- and honor bestowed on the most distinguished members of the microbiology community.
Profile: http://med.stanford.edu/profiles/Harry_Greenberg/
- **Kerry-Ann Stewart, SMS 2**, has been named a 2010 American Medical Association Foundation Minority Scholar.

Please join me in congratulating all the recipients for these wonderful honors.

Appointments and Promotions

- **Gill Bejerano** has been reappointed to Assistant Professor of Developmental Biology, effective 2/01/10.
Profile: http://med.stanford.edu/profiles/Gill_Bejerano/
- **Caroline Bérubé** has been promoted to Clinical Associate Professor of Medicine, effective 6/01/10.
Profile: http://med.stanford.edu/profiles/Caroline_Berube/
- **Peter Cahill** has been reappointed as Clinical Assistant Professor (Affiliated) of Surgery, effective 10/10/09.
- **William Cheng** has been promoted to Adjunct Clinical Assistant Professor of Medicine, Division of General Internal Medicine, effective 5/01/10.
- **Cheryl Cho-Phan** has been reappointed as Clinical Assistant Professor of Medicine, effective 5/01/10.
Profile: http://med.stanford.edu/profiles/Cheryl_Cho/
- **Fiona G.M. Clements** has been appointed Clinical Professor of Anesthesia, effective 7/01/10
- **Lawrence Crane** has been promoted to Adjunct Clinical Assistant Professor of Medicine, Division of General Internal Medicine, effective 5/01/10.
- **John Cunniff** has been promoted to Adjunct Clinical Assistant Professor of Medicine, Division of General Internal Medicine, effective 5/01/10.

- **Zubin Damania** has been promoted to Adjunct Clinical Assistant Professor of Medicine, Division of General Internal Medicine, effective 5/01/10.
- **Gansevoort H. Dunnington** has been appointed Clinical Assistant Professor of Cardiothoracic Surgery, effective 8/01/10.
- **Ira M. Friedman** has been promoted to Clinical Professor of Pediatrics and of Medicine, effective 4/01/10.
Profile: http://med.stanford.edu/profiles/Ira_Friedman/
- **Adella M. Garland** has been reappointed Clinical Assistant Professor (Affiliated) of Surgery, effective 10/10/09.
- **Richard D. Gregory** has been appointed Clinical Associate Professor of Cardiothoracic Surgery, effective 6/01/10.
- **T. Kyle Harrison** has been reappointed as Clinical Assistant Professor (Affiliated) of Anesthesia, effective 9/1/10.
- **Malcolm Lawton** was reappointed as Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 9/01/09.
- **David K. Levin** has been reappointed as Clinical Associate Professor (Affiliated) of Obstetrics and Gynecology, effective 9/01/10.
- **Margaret C. Lin** was promoted to Clinical Assistant Professor of Radiology, effective 7/01/10.
Profile: http://med.stanford.edu/profiles/Margaret_Lin/
- **Steven S. Lipman** has been promoted to Clinical Associate Professor of Anesthesia, effective 9/01/10.
Profile: http://med.stanford.edu/profiles/Steven_Lipman/
- **David W. Lowenberg** has been appointed as Clinical Professor of Orthopaedic Surgery, effective 6/15/10.
- **Katsuhide Maeda** has been promoted to Clinical Assistant Professor of Cardiothoracic Surgery, effective 7/01/10.
Profile: http://med.stanford.edu/profiles/Katsuhide_Maeda/
- **John D. Mark** has been promoted to Clinical Professor of Pediatrics, effective 7/01/10.
Profile: http://med.stanford.edu/profiles/John_Mark/
- **Randal R. Peoples** has been appointed Clinical Associate Professor of Neurosurgery, effective 8/01/10.
- **Donald E. Potter** has been reappointed Clinical Professor of Pediatrics, effective 6/15/10.
Profile: http://med.stanford.edu/profiles/Donald_Potter/
- **Thomas A. Rice** has been reappointed as Clinical Professor (Affiliated) of Ophthalmology, effective 5/01/10.
- **Ahmad Salehi** has been appointed Clinical Associate Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 7/01/10.
- **Gerald M. Shefren** has been reappointed Clinical Professor of Obstetrics and Gynecology, effective 6/17/10.
Profile: http://med.stanford.edu/profiles/Gerald_Shefren/
- **Greg Zaharchuk** has been reappointed to Assistant Professor of Radiology, effective 10/01/10.
Profile: http://med.stanford.edu/profiles/Greg_Zaharchuk/

Dean's Newsletter

June 28, 2010

Paul Khavari, MD, PhD Named Next Chair of Dermatology at Stanford

I am very pleased to announce that Dr. Paul Khavari, currently the Carl J. Herzog Professor of Dermatology and Chief of the Dermatology Service at the VA Palo Alto Health Care System, will become the Chair of the Department of Dermatology at Stanford. He will begin his new responsibilities on July 1st, succeeding Dr. Al Lane, who has served as chair of the department for the past 14 years.

I would first like to thank Dr. Lane for his exceptional leadership and for bringing the Department of Dermatology at Stanford to a pinnacle of excellence. Dr. Lane is very much respected and admired by his department, his colleagues at Stanford, and those across the nation for his contributions as an academic leader and clinical investigator. He was recently the recipient of a major disease team award from the California Institute of Regenerative Medicine and will continue to provide guidance, mentorship and oversight for the department's clinical research efforts. We owe Dr. Lane a huge debt of gratitude and I ask that you join me in thanking him for his wonderful accomplishments.

Dr. Khavari is also one of the most respected academic leaders in dermatology in the nation. It comes as no surprise that the Search Committee for the Chair of Dermatology, which was led by Dr. Christy Sandborg, Professor of Pediatrics and Chief-of-Staff at the Lucile Packard Children's Hospital, identified Dr. Khavari as an excellent candidate. His academic and clinical credentials are indeed notable. A Phi Beta Kappa graduate of Stanford in Biology and History, he went on to receive his MD degree from Yale, graduating AOA, and then did an internship in medicine and residency in dermatology at Yale. He then returned to Stanford, first to do a PhD in gene regulation with Dr. Gerry Crabtree in the Department of Pathology and then to join the VA and the Department of Dermatology as an Assistant Professor in 1993.

Dr. Khavari's subsequent research on the gene regulatory control of epithelial growth and carcinogenesis and his work on the development of new molecular therapeutics have won him national acclaim and numerous awards. These include the US Presidential Early Career Award for Scientists and Engineers, the Shannon Award from the NIH, a Young Investigator Award from the Department of Veterans Affairs, a Junior Faculty Scholar Award from the Howard Hughes Medical Institute, the American Dermatologic Association Young Leader Award, the American Academy of Dermatology Marion B Sulberger Award, the Society for Investigative Dermatology William Montagna Award and election to the Society of Clinical Investigation and the American Association of Physicians. Dr. Khavari became the Herzog Professor of Dermatology in 2003. In addition to his accomplishments in research, he has established a premier clinical program in dermatology at the Palo Alto VA. Equally importantly, he has been the mentor and research advisor to an ever-increasing number of undergraduate, medical and graduate students and is thus creating a legacy of continued excellence.

I am extremely pleased that Dr. Khavari has accepted our invitation to lead the Department of Dermatology, and I am confident that he and his colleagues will do an outstanding job. Finding the best leaders and faculty for our medical school community is among our most important

responsibilities, and I want to thank the Search Committee for their dedicated efforts in assembling an outstanding slate of potential candidates. In addition to Dr. Sandborg, the members included Ben Barres, Jonathan Berek, Sarah Donaldson, Patricia Engasser, Minx Fuller, Charlotte Jacobs, Renee Reijo Pera, Susan Pfeffer, Kevin Tabb, Jim McCaughey and Kunle Ogunrinade (SMS representative). I also want to thank Kendra Baldwin from the Office of Institutional Planning for her outstanding contributions in supporting the Search Committee and the candidates.

Protecting the Privacy of Our Colleagues and Co-Workers

At some point each of us will face a medical crisis or problem involving ourselves or a family member, friend or colleague. We will each have different ways of dealing with such an event – but each of us will want the right to protect our privacy unless we make the decision to share the news with others. From time to time you may become aware that a co-worker or colleague is facing a medical challenge. However, unless you have been personally informed or received expressed permission to do so, it is imperative that you not share or discuss such personal information – with co-workers or with the individual. This is a violation of personal privacy and HIPAA and should not occur. Even though it may seem “caring” to reach out to a friend or colleague about his or her personal well-being, you should not do so unless personally and specifically invited. I offer these comments because I have heard from a number of faculty who are facing a medical challenge about how distressing it is to them to be approached by colleagues in the workplace when they have made an individual decision to keep their medical information private or personal. We each deserve respect, privacy and discretion regarding personal matters. Just as we must protect the privacy of our patients, we also need to protect the privacy of our colleagues in the workplace.

When Rankings Become Self-Serving or Misinformed Promoters of Bias

I have written all too frequently about the methodological problems associated with the rankings of US medical schools by US News & World Report (USNWR). One of the most serious problems with the USNWR ranking is the way research success is defined and quantified. The emphasis in the methodology for research-intensive medical schools is on size instead of quality, and there is a significant focus on the total amount of funding from the National Institutes of Health – a number that is proportional to the size of the faculty as well as to each institution’s focus on “big science” versus innovative research. Because Stanford is among the smallest research-intensive medical schools in the nation, we simply cannot compete with institutions like UCSF, Penn, Hopkins and Harvard that are twice to ten times its size in faculty numbers in the total amount of NIH funding. Nor can we compete in faculty student ratios – which is also related to faculty size.

In addition to the quite imperfect and in some ways distorted ways of measuring success in research, it is particularly distressing when the calculations themselves have serious flaws. Over the past several years Stanford has occupied the number 6-7 position in the USNWR ranking for research-intensive schools. In the latest 2009 ranking, Stanford fell to number 11 – which certainly seems implausible, since conditions simply don’t change that quickly. This prompted us to completely reanalyze the methods and calculations used by USNWR, including the error of rounding fractional differences to whole numbers - creating compression and distortion of scores. Using a more correct approach (even with the flawed assumptions used by USNWR)

Stanford would remain solidly in the number 6-7 spot. But this not the real point, since the more important issue is the imperfect manner used to assess research. It is interesting to note that USNWR uses a more balanced approach to assess research in schools of engineering. For these schools, total institutional research funding is combined with research funding per faculty member along with the percentage of faculty who have been elected to the National Academy of Engineering. These last two measures constitute more objective reflections of faculty quality and achievement than simply the total amount of NIH dollars received by the institution.

It is notable that Stanford Medical School ranks number 1 in the amount of research funding per faculty member. And if the percent of Stanford faculty who have been elected to the National Academy of Science or the Institute of Medicine of the NAS were included in the ranking (as for Engineering), Stanford would likely do quite well. These metrics are far better indicators of research quality and would provide more useful information to prospective students (the audience USNWR professes to be addressing) about the quality of a research faculty than the approach currently employed by USNWR. I will make these and related points when I meet with USNWR in mid-July while I am in Washington.

Ironically, additional confusion on the ranking debate was recently added by a report in the June 15th issue of the *Annals of Internal Medicine* by F. Mullen et al entitled “*The Social Mission of Medical Education: Ranking the Schools*” (2010; 132:804-812). While perhaps well-meaning, this report further distorts reality by defining “social mission” as a measure of the percentage of graduates of a medical school who practice primary care, who work in health professional shortage areas, and who are underrepresented minorities. I certainly do not question the importance of producing more primary care physicians or for providing medical care for the underserved. These are enormously important issues. But it seems far too narrow to restrict the definition of the “social mission” of medical education to these metrics. Nor does it seem prudent to employ them across all medical schools – as if each had (or even should have) the same social mission. Indeed, if that were the case, medical education would be reduced to standards that would stifle innovation. We certainly need more primary care physicians, but we also need more physician scientists, and we need to continue to replenish our supply of innovators, leaders and specialists. Indeed, I would argue that training and educating physician scientists and leaders in medicine and healthcare are very much part of a broad social mission.

I surely understand the need to create order and I recognize the natural tendency to rank or prioritize outcomes. But I question whether rankings like those done by USNWR or the more recent “social mission” ranking provide any real enlightenment or benefit – or whether it simply permits bias to rule or promotes marketing opportunities.

Draft Publication of the ACGME Duty Hours Task Force Recommendations

On June 23rd, the 16- member Accreditation Council on Graduate Medical Education (ACGME) published for comment its recommendations on Resident Duty Hours. This has been a much discussed and anticipated report, especially following the 2008 publication of the Institute of Medicine Report *Resident Duty Hours: Enhancing Sleep, Supervision, and Safety* seemed to herald further restrictions to the “80 hour work week” that became the rule in 2003. There has been considerable commentary by virtually every professional society and group about this

matter, most calling for more attention to fatigue management and resident supervision than to further restrictions on work hours *per se*. The ACGME recommendations are based on very broad feedback and a thoughtful review of comments from every constituency and can be viewed at <http://acgme-2010standards.org/>.

Virtually simultaneously, the New England Journal of Medicine published an on-line summary, including a helpful table comparing the 2003 ACGME requirements to the 2008 IOM recommendations and the proposed 2010 ACGME requirements. I am taking the liberty of copying the table from the NEJM on-line summary below since it provides an excellent comparative summary.

From: Nasca, TJ, Day, SH, Amis, S for the ACGME Duty Hour Task Force, “The New Recommendations on Duty Hours from the ACGME Task Force” published in the June 23rd on-line New England Journal of Medicine (<http://content.nejm.org/cgi/content/full/NEJMs1005800>).

Table 1. Comparison of Selected Sections of the Proposed ACGME Requirements with the 2003 Standards and the IOM Recommendations.*

Category	ACGME 2003 Requirements	IOM 2008 Recommendations	Proposed 2010 ACGME Requirements
Supervision	Programs must ensure that qualified faculty provide appropriate supervision	Residency review committee should establish measurable standards of supervision according to specialty and level of training Residents in first yr must have immediate access to in-house supervision	Residents and attendings should inform patients of their role in the care of each patient Supervising faculty should delegate portions of care to residents Senior residents or fellows should serve in a supervisory role for junior residents Progressive responsibility for care must be assigned by the program director and faculty Residents are responsible for knowing the limits of their scope of authority Programs must set guidelines as to when residents are expected to communicate with supervisors Faculty assignments should be of sufficient duration to assess residents' knowledge and skills Programs must observe the following three classifications of supervision: level 1 — direct supervision (the supervising physician is physically present with the resident and patient); level 2 — indirect supervision; level 2a — supervising physician is on site and available to provide direct supervision; level 2b — supervising physician is available by phone and available to provide direct supervision; level 3 — oversight (the supervising physician reviews procedures and encounters after care is delivered) During the postgraduate yr 1, residents must have supervision level 1 or 2a
Workload	Learning objectives must not be compromised by excessive reliance on residents to fulfill service obligations Assignments must recognize that faculty and residents collectively are responsible for patient safety and welfare	Resident workload should be adjusted and work that is of limited or no educational value limited Residents should be provided with adequate time for patient care and reflection Appropriate limits on caseload should be set, taking into consideration complexity of illness and residents' competency	The workload for each resident must be based on level of training, patient safety, resident education, severity and complexity of patient illness, and available support services (specialty-specific guidelines to be enumerated by each specialty review committee) The learning objectives of the program must not be compromised by excessive reliance on residents to fulfill nonphysician service obligations
Maximum hr/wk	80/wk, averaged over 4 wk	80/wk, averaged over 4 wk	80/wk, averaged over 4 wk
Maximum length of duty period	Continuous on-site duty, including in-house call, must not exceed 24 consecutive hr Residents may remain on duty up to 6 additional hr to participate in didactic activities, transfer care of patients, conduct outpatient clinics, or maintain continuity of medical and surgical care No new patients may be accepted after 24 hr of continuous duty	Extended duty must not exceed 16 hr, unless a 5-hr nap is provided; 5-hr nap must be included in 80-hr limit; after 5-hr nap, resident may continue for up to 9 more hr for a total of 30 hr No new patients after 16 hr Extended duty (e.g., 30 hr with 5-hr nap) must not occur more frequently than every third night; averaging is not allowed	Duty periods of residents in postgraduate year 1 must not exceed 16 hr Intermediate-level and senior residents (postgraduate yr 2 and above) may be scheduled for a maximum of 24 hr of continuous duty; programs must encourage residents, as professionals, to use alertness-management strategies to maintain alertness in the context of patient care responsibilities; strategic napping, especially after 16 hr of continuous duty and between 10 p.m. and 8 a.m. is strongly suggested Residents may remain on site for periods of no longer than an additional 4 hr to provide for the transfer of care and may not attend continuity clinics after 24 hr of duty In unusual circumstances, residents may remain beyond scheduled hr to continue to provide care for a single patient; justifications are limited to required continuity of care for a patient who is severely ill or whose condition is unstable, academic importance, or humanistic attention to the needs of a patient or family; residents cannot be compelled to spend these additional hr
In-hospital on-call frequency	Every third night, on average	Every third night; no averaging	Intermediate-level and senior residents (postgraduate yr 2 and above) — every third night (no averaging)
Minimum time off between scheduled duty periods	Adequate time for rest and personal activities must be provided, consisting of 10 hr off between all daily duty periods and after in-house call	Time off must be provided as follows: 10 hr off after regular daytime duty period 12 hr off after night duty 14 hr off after an extended duty period, and must not return before 6 a.m. the next day	Residents in postgraduate yr 1 should have 10 hr off and must have 8 hr free of duty between scheduled duty periods Intermediate-level residents should have 10 hr off and must have 8 hr between duty periods and 14 hr free of duty after 24 hr of in-hospital duty Residents in the final yr of training should have 10 hr free of duty and must have 8 hr between scheduled duty periods; review committees may create standards that allow residents to return to work in less than 8 hr under the monitoring of the program director
Maximum frequency of in-hospital duty	Specialty-specific requirements apply	Night duty must not exceed 4 consecutive nights and be followed by a minimum of 48 continuous hr off (after 3 or 4 consecutive nights)	Residents must not be scheduled for more than 6 consecutive nights of night duty (night float) (the maximum no. of consecutive wk of night float and maximum no. of mo of night float per yr may be further specified by the specialty review committee)
Mandatory off-duty time	24 hr off per 7-day period, averaged over 4 wk, inclusive of call	24 hr off per 7-day period; no averaging; one golden weekend per mo†	24 hr off per 7-day period (when averaged over 4 wk); home call cannot be assigned on these free days
Moonlighting	Moonlighting must not interfere with residents' ability to achieve the goals and objectives of the educational program Internal moonlighting must be considered part of the 80-hr limit	Internal and external moonlighting count as part of 80-hr limit Residents must receive permission from program director to moonlight, and resident performance will be monitored to ensure no adverse effects from moonlighting	Internal and external moonlighting are to be included in 80-hr limit Residents in postgraduate year 1 must not be permitted to moonlight, internally or externally
Duty-hr exceptions	Review committee may grant exceptions for up to 10%, or a maximum of 88 hr, for individual programs based on a sound educational rationale	Review committee may grant exceptions for up to 10%, or a maximum of 88 hr, for individual programs based on a sound educational rationale	Duty-hr exceptions to 88 hr per week averaged are permissible for select programs with a sound educational rationale; before submitting the request to the review committee, the program director must obtain permission from the designated institutional official and the Graduate Medical Education Committee
Home call	The frequency of home call is not subject to the every-third-night, or 24-6, limitation, but home call must not be so frequent as to preclude provision for rest and reasonable personal time Residents on home call must have 1 day in 7 free from all responsibilities, averaged over 4 wk Hr logged when residents are called into the hospital are counted toward the 80-hr limit		Time on home call spent by residents in hospital must count toward the 80-hr maximum weekly limit; frequency of home call is not subject to the every third night limitation; at-home call must not be so frequent or taxing as to preclude rest or reasonable personal time for each resident Residents are permitted to return to the hospital while on home call to care for new or established patients; each episode of this type of care, although it must be included in the 80-hr weekly maximum, will not initiate a new off-duty period

* Information on four categories of the proposed requirements that are not listed in the table (teamwork; professionalism, personal responsibility, and patient safety; transitions of care; and alertness management) is available with the full text of this article at NEJM.org. ACGME denotes Accreditation Council for Graduate Medical Education, and IOM Institute of Medicine.

† Golden weekends are weekends entirely free of responsibility for patient care.

The Association of American Medical Colleges (ACGME) has already issued a statement endorsing the ACGME proposed duty hour requirements (see: <http://www.aamc.org/newsroom/pressrel/2010/100623.htm>). The draft ACGME standards are available for public comment through August 9, 2010 (see: <http://acgme.org>) and, when finalized, will be put into effect in July 2011.

Evaluation of Medical Student Performance During Clinical Rotations

In tandem with the proposed requirements for resident duty hours, the ACGME also published criteria for evaluating residency programs and resident performance. Expectations for knowledge-based assessment as well as professionalism mirror a number of criteria that will be employed in our medical student CBEI (Criterion Based Evaluation System - <http://med.stanford.edu/md/curriculum/CBEI/index.html>) program, which begins on June 28th. Following the decision more than a year ago to institute a more formal evaluation of clinical performance during core clerkships, a thoughtful, careful, comprehensive and engaged task force led by Dr. Elizabeth Stuart, Clinical Associate Professor of Pediatrics, has done an exceptional job in defining the criteria that will be used to evaluate student performance in Internal Medicine, Pediatrics, Surgery, Neurology, Obstetrics and Gynecology and Psychiatry. Dr. Stuart has kept students and faculty informed about the policies and procedures being utilized through numerous committee meetings, town halls, presentations to the Clinical Clerkship Program Directors, Faculty Senate and Executive Committee as well as postings on the CBEI website.

I want to thank Dr. Stuart for the exceptional progress that has been made and for the leadership and integrity that has been employed along the way. I am cognizant that any change brings questions, concerns and anxieties, especially for our students and faculty. But I am confident that the appropriate steps have been taken to address these concerns and that the process will be monitored carefully and adapted as appropriate. That said, I also believe that this is an incredibly important step in assuring that our students are being prepared to become outstanding physicians in every domain and dimension and to demonstrate their skills, knowledge and professionalism to the fullest extent possible.

Measuring Academic and Faculty Success

Over the past year we have continued efforts to support faculty development and success. A number of departmental task forces were engaged in this effort following the 2009 Strategic Planning Leadership Retreat and over the past 8 months we have had a number of these reports presented at our Executive Committee. On June 4th we heard reports on “creating a culture that fosters faculty success” from the Departments of Urology and Radiation Oncology. I want to offer special thanks to Craig Comiter, Associate Professor of Urology and Albert Koong, Associate Professor of Radiation Oncology, for sharing the initiatives they led in their respective departments.

- The metrics used in the Department of Radiation Oncology focus on clinical care, teaching, research and service. The proportional weight given to these categories varies according to the faculty line and the percent effort projected for each of these missions. Based on this, the department has developed detailed and specific metrics for each faculty line and rank as a guide to evaluating performance. The department recognizes that the

specificity of such metrics should be used as a tool and guide and not as a substitute for informed judgment.

- The Department of Urology reviewed the literature on metrics to assess faculty performance in mission related categories like research, teaching, service (and citizenship) as well as job satisfaction and personal fulfillment. Again the metrics they defined were presented as guides for faculty and related to the culture of the department.

The discussion that followed the presentation underscored that metrics vary among faculty lines and ranks as well as by departmental culture and discipline. Transparency to individual faculty about which factors are deemed important for his or her own success is important. For example, while everyone recognizes that the quality of a research contribution is more important than quantity, it is often noted that junior faculty have a hard time discerning what defines “high quality publication” or whether there is some threshold number needed for promotion. Clearly it is not possible to spell these out with comforting specificity – making it all the more important for junior faculty to have regular discussions and feedback from their advisors or supervisors. A continuing source of confusion also relates to the value placed on “collaborative” research versus individual contributions. Despite our focus on interdisciplinary research and collaboration, the culture of universities (including Stanford) still places a premium on individual contributions. This too is a work in progress.

Dedication of the C.J. Huang Asian Liver Center

On Wednesday, June 9th, Dr. Sam So, the Lui Hac Minh Professor in the Department of Surgery and the Director of the Liver Cancer Program, hosted the official opening of the New Asian Liver Center (ALC) at Stanford. Dr. So also directs the Asian Liver Center that is housed at 490 South California Avenue in Palo Alto. This event was also organized to thank and acknowledge the generosity of Dr. and Mrs. C.J. Huang, who played a key role in launching the Asian Liver Center in 1996 and whose generosity helped support the Center’s new location. The Huangs were celebrated as “Honorary Founders.”

This event was also provided an opportunity to thank Dr. So and his colleagues for their tremendous leadership and contributions in calling attention to the impact of Hepatitis B on liver cancer, especially in Asia. The Asian Liver Center has led vaccination programs to prevent Hepatitis B, especially in the Asian communities in the Bay Area and through major initiatives in China. The Asian Liver Center is a wonderful demonstration of a faculty member’s ability to influence the prevention of a serious human through commitment, research and advocacy.

Awards and Honors

- **Dr. Richard Tsien**, George T. Smith Professor in the Department of Molecular and Cellular Physiology, is the recipient of the 8th Annual George E. Palade Gold Medal Award, along with co-recipients Drs. Bill Catterall and Walter Boron. The committee was very impressed by Dr. Tsien’s work leading to the discovery of the N-type calcium channels. Dr. Tsein will be honored at an awards ceremony held in this fall.

- **Dr. Pat Basu**, Attending Physician, Department of Radiology, has been appointed a White House Fellow and Special Assistant to the President. This is a highly competitive recognition and we are proud of Dr. Basu's success.
- **Dr. Ron Garcia**, Senior Lecturer and Director, Center of Excellence, is one of three recipients of The California Wellness Foundations 2010 Champions of Health Professions Diversity Award that recognizes "exceptional individuals who demonstrate leadership in important health issues."
- The Board of Directors of the Baxter Foundation has selected the 2010 Baxter Faculty Scholars. They are:
 - **Manish Butte, MD, PhD**, Assistant Professor of Pediatrics, and
 - **Fan Yang, PhD**, Assistant Professor of Orthopaedic Surgery and Bioengineering
- **Dr. Sam Gambhir**, Virginia and D.K. Ludwig Professor of Cancer in the Department of Radiology, and his colleagues have been awarded a new U54 from the NIH as a Center for Cancer Nanotechnology Excellence. This grant will likely approximate \$15 million over the next 5 years and will bring together faculty from the departments of Radiology, Medicine, Obstetrics and Gynecology as well as other faculty in the Schools of Medicine and Engineering.

Appointments and Promotions

Cristina Alvira has been appointed to Assistant Professor of Pediatrics, effective 7/01/10.

Marc A. Coram has been reappointed to Assistant Professor of Health Research and Policy, effective 6/01/10.

David Paik has been reappointed to Assistant Professor (Research) of Radiology, effective 6/01/10.

Laura W. Roberts, has been appointed to Professor of Psychiatry and Behavioral Sciences, effective 9/01/10.

Daniel Spielman has been promoted to Professor of Radiology, effective 7/01/10.

The Association of American Medical Colleges (ACGME) has already issued a statement endorsing the ACGME proposed duty hour requirements (see: <http://www.aamc.org/newsroom/pressrel/2010/100623.htm>). The draft ACGME standards are available for public comment through August 9, 2010 (see: <http://acgme.org>) and, when finalized, will be put into effect in July 2011.

Evaluation of Medical Student Performance During Clinical Rotations

In tandem with the proposed requirements for resident duty hours, the ACGME also published criteria for evaluating residency programs and resident performance. Expectations for knowledge-based assessment as well as professionalism mirror a number of criteria that will be employed in our medical student CBEI (Criterion Based Evaluation System - <http://med.stanford.edu/md/curriculum/CBEI/index.html>) program, which begins on June 28th. Following the decision more than a year ago to institute a more formal evaluation of clinical performance during core clerkships, a thoughtful, careful, comprehensive and engaged task force led by Dr. Elizabeth Stuart, Clinical Associate Professor of Pediatrics, has done an exceptional job in defining the criteria that will be used to evaluate student performance in Internal Medicine, Pediatrics, Surgery, Neurology, Obstetrics and Gynecology and Psychiatry. Dr. Stuart has kept students and faculty informed about the policies and procedures being utilized through numerous committee meetings, town halls, presentations to the Clinical Clerkship Program Directors, Faculty Senate and Executive Committee as well as postings on the CBEI website.

I want to thank Dr. Stuart for the exceptional progress that has been made and for the leadership and integrity that has been employed along the way. I am cognizant that any change brings questions, concerns and anxieties, especially for our students and faculty. But I am confident that the appropriate steps have been taken to address these concerns and that the process will be monitored carefully and adapted as appropriate. That said, I also believe that this is an incredibly important step in assuring that our students are being prepared to become outstanding physicians in every domain and dimension and to demonstrate their skills, knowledge and professionalism to the fullest extent possible.

Measuring Academic and Faculty Success

Over the past year we have continued efforts to support faculty development and success. A number of departmental task forces were engaged in this effort following the 2009 Strategic Planning Leadership Retreat and over the past 8 months we have had a number of these reports presented at our Executive Committee. On June 4th we heard reports on “creating a culture that fosters faculty success” from the Departments of Urology and Radiation Oncology. I want to offer special thanks to Craig Comiter, Associate Professor of Urology and Albert Koong, Associate Professor of Radiation Oncology, for sharing the initiatives they led in their respective departments.

- The metrics used in the Department of Radiation Oncology focus on clinical care, teaching, research and service. The proportional weight given to these categories varies according to the faculty line and the percent effort projected for each of these missions. Based on this, the department has developed detailed and specific metrics for each faculty line and rank as a guide to evaluating performance. The department recognizes that the specificity of such metrics should be used as a tool and guide and not as a substitute for informed judgment.
- The Department of Urology reviewed the literature on metrics to assess faculty performance in mission related categories like research, teaching, service (and citizenship) as well as job satisfaction and personal fulfillment. Again the metrics they defined were presented as guides for faculty and related to the culture of the department.

The discussion that followed the presentation underscored that metrics vary among faculty lines and ranks as well as by departmental culture and discipline. Transparency to individual faculty about which factors are deemed important for his or her own success is important. For example, while everyone recognizes that the quality of a research contribution is more important than quantity, it is often noted that junior faculty have a hard time discerning what defines “high quality publication” or whether there is some threshold number needed for promotion. Clearly it is not possible to spell these out with comforting specificity – making it all the more important for junior faculty to have regular discussions and feedback from their advisors or supervisors. A continuing source of confusion also relates to the value placed on “collaborative” research versus individual contributions. Despite our focus on interdisciplinary research and collaboration, the culture of universities (including Stanford) still places a premium on individual contributions. This too is a work in progress.

Dedication of the C.J. Huang Asian Liver Center

On Wednesday, June 9th, Dr. Sam So, the Lui Hac Minh Professor in the Department of Surgery and the Director of the Liver Cancer Program, hosted the official opening of the New Asian Liver Center (ALC) at Stanford. Dr. So also directs the Asian Liver Center that is housed at 490 South California Avenue in Palo Alto. This event was also organized to thank and acknowledge the generosity of Dr. and Mrs. C.J. Huang, who played a key role in launching the Asian Liver Center in 1996 and whose generosity helped support the Center’s new location. The Huangs were celebrated as “Honorary Founders.”

This event was also provided an opportunity to thank Dr. So and his colleagues for their tremendous leadership and contributions in calling attention to the impact of Hepatitis B on liver cancer, especially in Asia. The Asian Liver Center has led vaccination programs to prevent Hepatitis B, especially in the Asian communities in the Bay Area and through major initiatives in China. The Asian Liver Center is a wonderful demonstration of a faculty member’s ability to influence the prevention of a serious human through commitment, research and advocacy.

Awards and Honors

- **Dr. Richard Tsien**, George T. Smith Professor in the Department of Molecular and Cellular Physiology, is the recipient of the 8th Annual George E. Palade Gold Medal Award, along with co-recipients Drs. Bill Catterall and Walter Boron. The committee was very impressed by Dr. Tsien’s work leading to the discovery of the N-type calcium channels. Dr. Tsein will be honored at an awards ceremony held in this fall.
- **Dr. Pat Basu**, Attending Physician, Department of Radiology, has been appointed a White House Fellow and Special Assistant to the President. This is a highly competitive recognition and we are proud of Dr. Basu’s success.
- **Dr. Ron Garcia**, Senior Lecturer and Director, Center of Excellence, is one of three recipients of The California Wellness Foundations 2010 Champions of Health

Professions Diversity Award that recognizes “exceptional individuals who demonstrate leadership in important health issues.”

- The Board of Directors of the Baxter Foundation has selected the 2010 Baxter Faculty Scholars. They are:
 - **Manish Butte, MD, PhD**, Assistant Professor of Pediatrics, and
 - **Fan Yang, PhD**, Assistant Professor of Orthopaedic Surgery and Bioengineering
- **Dr. Sam Gambhir**, Virginia and D.K. Ludwig Professor of Cancer in the Department of Radiology, and his colleagues have been awarded a new U54 from the NIH as a Center for Cancer Nanotechnology Excellence. This grant will likely approximate \$15 million over the next 5 years and will bring together faculty from the departments of Radiology, Medicine, Obstetrics and Gynecology as well as other faculty in the Schools of Medicine and Engineering.

Appointments and Promotions

Cristina Alvira has been appointed to Assistant Professor of Pediatrics, effective 7/01/10.

Marc A. Coram has been reappointed to Assistant Professor of Health Research and Policy, effective 6/01/10.

David Paik has been reappointed to Assistant Professor (Research) of Radiology, effective 6/01/10.

Laura W. Roberts, has been appointed to Professor of Psychiatry and Behavioral Sciences, effective 9/01/10.

Daniel Spielman has been promoted to Professor of Radiology, effective 7/01/10.

Dean's Newsletter

July 26, 2010

SUMMER SCHEDULE

Even though nothing really seems to ever slow down in the School of Medicine, and in fact many new programs begin in the summer, I have traditionally changed the frequency of the Dean's Newsletter from every other week to every 3-4 weeks during July and August. I doubt many of you are missing the more frequent transmissions, but I did want to remind you about the altered summer schedule and also that the regular biweekly one will commence in September. All that said, I hope you have some quiet and restful times during the remainder of July and in August.

Thinking About Postdoctoral Fellows and Scholars

As I noted in the May 14th Dean's Newsletter, "*Thinking About Learning*" (see: http://deansnewsletter.stanford.edu/archive/05_03_10.html#2) is an imperative if we are to optimally serve the needs of future students – be they high school students, college undergraduates, medical or graduate students, postdoctoral scholars as well as clinical residents and fellows, and faculty and professionals in our community and beyond. This realization is prompted by the opening of the Li Ka Shing Center for Learning and Knowledge (LKSC), but also by our recognition that learning behaviors and teaching styles will continue to change, perhaps dramatically, in tandem with emerging technology and new knowledge. At the same time, the career pathways for those graduating from Stanford's degree and training programs will evolve with the economy and broadening opportunities.

Given these changes, we have planned three parallel tracks of discussion, review and assessment: medical student education, graduate student education and postdoctoral scholar training. The plan is to begin with separate discrete interdisciplinary "think tanks" between now and September that will delineate questions requiring more in-depth analysis and review during the fall and winter. My hope is that we will be able to bring each of these three efforts into a more integrated discussion at our Annual Strategic Planning Leadership Retreat in January 2011.

On Saturday, July 17th, some 35 individuals, representing postdoctoral scholars, clinical fellows, faculty and administrative leaders as well as volunteer representatives from industry and career/employment centers convened in the LKSC Boardroom and engaged in a thoughtful, candid, far ranging and informative discussion about postdoctoral fellows and scholars at Stanford. I was pleased that we began our triad of think tanks with the topic of "postdocs," since this is not infrequently the group that feels the most disenfranchised, despite their importance to virtually every mission of Stanford Medicine. As I pointed out at the beginning of the "Postdoc Think Tank," there are nearly twice as many postdoctoral trainees in the School of Medicine as there are degree program students. For example, in this past year we had 1157 degree-seeking students (including 471 pursuing an MD or joint MD-other degree program, and 686 pursuing a PhD degree). Overall, our number of medical and graduate students is small compared to the other schools at Stanford. At the same time we have 2158 post-degree trainees, far more than in the other Stanford schools. This past year they consisted of 739 residents pursuing certification in medical, surgical and related specialties and subspecialties as well as 310 clinical fellows, each of whom do some research as part of their fellowship, and 1109 research postdocs.

Although there are differences in the programs and career paths for MD and PhD's pursuing clinical fellowships versus those in research training, there are also a number of overlaps in the issues these trainees face. Recognizing these commonalities, we made this initial think tank inclusive. Clearly, the overall portfolio of our more than 2100 postdoctoral trainees is quite diverse and has a number of subgroups and constituencies (e.g., those interested in academic careers versus other career pathways; those involved in clinical training versus pure research training; those international postdocs who come with an intention of returning to their home country versus those who are seeking a way to remain in the USA). For this initial discussion, though, I wanted to focus on a broad discussion of career opportunities and the goals and purposes for postdoctoral training.

In my opening comments, I reflected on the reality that the expectation for a postdoctoral fellowship has evolved over the past couple of decades from an optional training experience that only a small fraction of young scientists had into a virtual requirement of a bioscience career pathway. This has been coupled with increased lengths of training periods and, for a large number of trainees, more than one postdoctoral fellowship. While such fellowships provide opportunities for recent graduates to gain hands-on, on-the-job training and allow some to guide and even lead research programs, they also prolong the time spent as a trainee versus as an independent (or principal) investigator. This in turn has contributed to the fact that the average age of recipients of a first RO1 grant has risen to 42 years– which is quite concerning. Along with this reality is the fact that there are far fewer academic positions that postdocs can compete for, making the sometimes-presumed connection between graduate school and an academic position, tenuous or even illusory.

All of these factors lead to the important question of whether we (not simply at Stanford but collectively as a nation) are training too many postdocs. Put another way, should we reduce the number of postdocs who come to Stanford? Should there be some more organized admissions process to complement the decisions made by PIs that is based on need, funding and available resources? Should coordination occur at the department level or more broadly, as it does for our degree programs? We already limit the length of postdoc training to five years and disallow more than one postdoc; should those conditions be modified further? Although it has been tried before, the question of whether we should have a “Whitehead postdoc model” for selected trainees would benefit from renewed discussion. Alternatively, there are many other career pathways for postdocs (e.g., industry, education and beyond) for which we are not necessarily (or in an organized manner) providing education or preparation. Whether and how we should do this are important questions.

During the July 17th think tank we first discussed what is working and what needs work at Stanford. Naturally (and I think appropriately) there was much more focus on what needs work in order to build on the excellent foundation of science opportunity and the culture of innovation that already exists at Stanford. It is widely acknowledged that we possess the key building blocks and resources and the very fact that we are willing to engage in a dialogue about how to make things better is evidence of our commitment. It also seemed apparent that a number of the resources already available for education and career development are not as well appreciated as they should be – making continued communication a high priority.

Understandably, there are lots of issues that we would all acknowledge need work. Among these are the cultural perceptions of relative value by postdocs, faculty and our community. For instance, there seems little question that if one’s intent is to pursue an academic career, the level of receptivity and acceptance by the Stanford community is greater than if one is interested in industry or another alternate career pathway. Clearly this is a generalization, since many faculty and labs are quite open and permissive to a wide range of career paths – but this is not consistent.

Another underlying theme was the question of the true purpose of a postdoc position. For example, is it really to further training and career development (in which case the focus is on the postdoc) or is it to further the work in the lab – both intellectually and in terms of expanding the workforce? A focus on enhancing training and career development leads to other issues, such as

whether we need work on mentoring and career advice and development, along with improved communication about resources and opportunities. A major concern is the length of training, although this needs to be framed in the context of the overall career path (i.e., from high school through postdoctoral training). There is a need for consolidation and reorganization of the training pathway – rather than just adding more, as has been the case in the past and present.

There was a general consensus that the training period for postdocs is too long and that there are not sufficiently graduated levels of responsibility. This topic also relates to the issue of whether selected postdocs can serve as principal investigators – an issue currently under discussion with the University Faculty Senate.

It was broadly recognized that the career goals of postdocs vary and that they may change over the course of the fellowship. While some postdocs enter with defined plans and in specific programs (this is clearly the case for clinical fellows), others begin with aspirations for one type of career but find that their interests or opportunities become quite different as their postdoc training continues. Building in more formal options for alternate career pathways was a topic of considerable discussion. While there is consensus that many skills acquired during graduate school and postdoctoral training are foundational, other skills, such as in leadership and particularly in business and entrepreneurship, require different types of exposure and training – either as part of a formal degree program or as part of a flexible training program. That said, it was also apparent that the time to address these issues is really during graduate and medical school and that increased attention to and focus on career opportunities, education and training should take place prior to beginning a postdoctoral program. Certainly this will be a topic for our future think tanks on medical and graduate student education programs.

Attention to the career development of women and minorities is an area requiring additional work. We are conversant with the many gender challenges that occur during academic careers and have focused attention on faculty development (see below). But many of these same issues apply to postdocs, and it is important to further assess and determine what we can do to ameliorate them. Also highlighted were issues of dual career families.

In the second part of the think tank we queried what we could do that would be “big and bold.” We asked whether the current postdoc model could – or should – change, and, if so, how. In doing so we wanted to frame and craft the issues and questions that require additional study and input. We ended up with basically two approaches: enhancing the current model or reshaping the postdoc model for the future. Here is a distillate of the discussion – which will certainly require further elaboration. Needless to say we would appreciate your input as well.

Enhancing the Current Model

- **Career pathways**
 - *Non-academic pathways*
 - Provide additional structured explorations of non-academic careers
 - Address cultural issues that discourage non-academic career choices and that may also discourage PIs from permitting postdocs to spend the time engaging in these explorations.

- Mandate that PhD committees include discussions of different career pathways.
 - Tap into the pharma and biotech industries in the Bay Area
 - A forum of pharma, biotech – develop internships, teach classes could help launch novel programs.
 - Be cognizant and focused on focused career pathway as part of the selection process. For example:
 - Institutions like Stanford traditionally train postdocs interested in academic positions and thus our admissions program should focus on such individuals.
 - If a postdoc applicant is really interested in industry perhaps it is better for such individuals to do their training in a company.
 - Expand SPARK; have a self-sustaining program focused specifically on translating ideas to industry
- **Academic pathways**
 - Departments/institutes could consider hiring assistant professors directly from graduate programs (i.e., without a postdoc). This would require a major cultural shift and would need careful assessment.
 - Create hybrid positions – opportunities to be in a position that is not a postdoc and not a faculty member, but with ability to apply for grants. An aspect of this is currently under consideration.
 - Encourage our postdocs to explore the academic opportunities that are emerging internationally.
- **Mentoring**
 - Mentoring by a team, not a single individual - untie postdocs from the single mentor model. This is not a new suggestion.
 - Establish mentoring committees for postdocs, analogous to the PhD thesis committee (The department of Chemical and Systems Biology has begun to have such committees.)
 - Establish a grants office for trainees in the SOM – assistance in applying for grants available to postdocs/PhD students, MD/PhD students.
 - Acknowledge the diversity of the postdoc population and tailor mentoring to take this diversity into account.
 - Provide guidance to faculty regarding postdoc mentoring.
- **Other ideas**
 - Limit the postdoc pool; have a rigorous review process for determining postdoctoral fellowship offers
 - Develop a “competencies model” for postdoctoral training.
 - Assure that assessment and feedback are part of any model.

Reshaping the Model for the Future

- **Shorten training**

- Undergraduate (or even high school) to PhD and postdoc
- Undergraduate to medical school to residency
- Diminish the status/privilege differences between the “silos” of phases of training (grad student vs. resident vs. fellow)
- Shorten physician scientist training
 - Start earlier
 - Undergrad to med school (with a taste of research)
 - Then research (with or without a PhD)
 - Change the MD/PhD program
 - Deal with structural misalignments
 - Pilot this here at Stanford
 - Especially important for women and minorities
- **Look for gifted younger students** – get them started early – undergraduates, and even earlier – Stanford Medical Youth Science Program, Stanford’s Education Program for Gifted Youth.
- **Explore the Whitehead Fellows model** to create independence at an earlier stage of career development. Apparently this was tried previously at Stanford (in fact likely more than once) without great success. But further assessment and exploration could still be meritorious.
- **Change the balance of PhDs and postdocs**
 - Compared to other schools (like Engineering) the postdoc model is relatively unique to bioscience training. This may be inherent to the biosciences but other disciplines (like engineering) begin faculty appointments with no or much briefer postdoc training.
 - At the same time, the question of balance between graduate students and postdocs needs to be considered. Currently graduate students are more expensive compared to postdocs, but they are also vetted for selection in a more programmatic manner. They do not have the experience of postdocs and thus many will contribute less to the intellectual capital of the program. This cannot be an either/or scenario – but it is one of balance. Should we have more graduate students and fewer postdocs? That said, we still need to be cognizant of the career opportunities for either graduate and/or postdocs. It is certainly recognized that this is very hard to predict, but we need to take the limitations of opportunities seriously, especially during the current economic downturn.

Next Steps

Based on the helpful discussion we had at this initial think tank, we plan to further develop some of the important ideas and recommendations that came forward and then to look at their intersections with the parallel work that will take place for graduate and medical student education. As part of this process we will focus on the discrete training goals and career paths of PhD scientists, on one hand, and physician-scientists on the other. This consideration will include assessing the key objectives from the trainee perspective as well as that of the institution

at a macro level and of the institutes, departments and principal investigators who support and provide the foundations for postdoctoral training and development.

Clearly the length of training – especially when combined with undergraduate (college and even high school) and graduate education – is too long. A more coordinated view is important; it should have the objective of getting graduates to longitudinal career pathways much sooner, while also creating options so they can consider a diversity of opportunities, in academia, industry and beyond. To accomplish this we need to work on the institutional, organizational and federal regulatory rules and impediments that impact coordination and consolidation. Some of these arise from the discrete regulatory agencies and organizations that accredit or certify institutions or individuals; others come from government agencies, particularly the NIH, that affect the funding and flexibility of fellowships supported by training grants. We also have considerable work to do at the institutional level to address cultural assessments and expectations of what constitutes a respectable career pathway and to be more open to alternatives, be they in work schedule or ultimate direction. This is especially true if we are to more successfully support the careers of women and minorities.

Of course we also need to recognize that postdocs are an amalgam of different groupings and expectations, including MDs, PhDs and mixtures thereof. They also include individuals with differing expectations, from different parts of the world – some of whom have a position they will return to and others who are seeking a new home they can move to. Their needs and expectations are different, and the way they behave and interact with each other will differ as well. In tandem, the blend of cultures, ethnicities and languages adds diversity as well as complexity in communicating and in planning.

Over the next couple of weeks we will be communicating further with the individuals who attended the July 17th Think Tank. We will develop specific subgroups under the banner of “Postdocs” that will explore assigned topics in greater depth. We will then plan to coordinate their findings in reports back to the broader group and to those focusing on medical student and graduate student education. We will then bring the findings and recommendations to our Leadership Retreat in January and either implement those that seem appropriate or work further on the elements needing more discussion and exploration. I will do my best to share information with you and as always will appreciate your comments and recommendations along the way.

Academic Life: Flexible and Alternate Work Schedules

Faculty recognize the drill explicitly or implicitly. Success in academia requires, among other things, commitment, dedication, focus, energy, creativity, luck and time. For most faculty, time is a major issue – simply in the sheer number of hours per day and week that it takes to construct a portfolio leading to academic promotion and success. Time also means the need to achieve measurable success within 7-10 years from appointment as assistant professor to associate professor and tenure or, for clinical faculty, to a promotion that carries with it the possibility of reappointment. While the opportunities to discover, innovate, educate and care for patients can be exciting and exhilarating, the pressure to demonstrate unique individual success to internal and external reviewers and evaluation committees also creates considerable stress. For many those pressures occur simultaneously with personal and family pressures, including childbirth

and childcare and the concomitant financial and related pressures. The balancing between professional and personal demands and expectations can be exacting, demanding and rate limiting. They may even lead some of the most talented young physicians and scientists to never get on or to get off the academic train and seek non-academic careers - or to continue in academia, with sometimes destructive personal consequences.

Over the years we have spent considerable time and effort trying to find ways to support faculty and their career development – through our Offices of Academic Affairs and of Diversity and Leadership. A number of programs have been put into place in the medical school and university to reduce pressure, provide support (including information and resources) and extend the time to the promotion decision. Among the issues that have been addressed (with varying degrees of success) are maternity, paternity and adoption leave; extension of the tenure clock for family responsibilities; and childcare and related services. We have annotated our progress and failings in various leadership programs, opportunities and reports – including a number in prior issues of this Newsletter. While the Stanford School of Medicine currently permits part-time appointments and job-sharing on a case-by-case basis, such alternative work schedules are not common, and the “culture” does not readily embrace or support such appointments. That said, it is in my opinion that it is essential that we explore such alternative career pathways. They work in other settings, and we need to determine whether we can figure out ways of changing both the culture and career path options in the School of Medicine.

I have asked Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership and Professor of Medicine, and Dr. Christy Sandborg, Chief-of-Staff at the Lucile Packard Children’s Hospital and Professor of Pediatrics, to lead a task force to explore and develop Flexible Work Arrangements. These have been explored and occasionally implemented at other institutions of higher education, but they are not part of the medical school culture. However, I know from discussions with colleagues around the country that there is receptivity on the part of some schools and leaders to determine the feasibility and opportunities for flexible work arrangements as part of an overall agenda of improving faculty career development. To carry out this exploration at Stanford, Drs. Valantine and Sandborg will partner with other Stanford colleagues and will also engage with the American Council on Higher Education. I view this as a critically important project, and we will be giving it a high priority. I wanted to let you know that it is getting underway and that we will be seeking input, recommendations and hopefully some transformative thinking as we move forward.

Should We Hold Annual Meetings For Senior Faculty?

When we think of mentoring and career development our attention naturally and appropriately turns to junior faculty. But career development evolves over a lifetime, and plans and expectations change accordingly. Several years ago we appointed a Senior Transitions Task Force led by Dr. Gary Schoolnik. I have previously reported the recommendations of that task force and we have developed a website (<http://med.stanford.edu/academicaffairs/senior-faculty/>) and resource center to help assist senior faculty with questions and concerns. The question has now arisen about whether we should codify this process further into an annual meeting – as we would do for more junior faculty. When we discussed this topic at a recent Executive Committee, we heard a range of perspectives and comments.

We all recognize that medical schools are different from other components of universities, in that nearly all medical school faculty are on “soft money” – which comes primarily from research grants or clinical income. As these sources become more constrained, the expectations held by a senior faculty member can become misaligned with those of colleagues or of her or his department. While many faculty plan for their own transitions, some find that difficult, even frightening – and, as a result, they exercise avoidance. We also recognize that senior members of our faculty have contributed significantly to all of the missions of the school, university and medical center. Many have helped define the excellence of Stanford as we know it today. We share a deep respect for past accomplishments as well as the recognition that future planning provides an insurance to disappointment or even disillusionment. The loss of competitive support for research or the decreased dexterity for technical procedures is an inevitable part of life. It is no different in cognitive and technical expertise than it is in sports or physical endurance. Having just completed the San Francisco Marathon yesterday, I am well aware of the boundaries of endurance. And of course we all need to consider and plan for transitions.

The question of whether senior faculty should have a counseling session, career guidance meeting or simply an annual discussion with their department chair evoked different viewpoints in the Executive Committee discussion. Some chairs felt it was an important part of their role and responsibility; others expressed concern that they were poorly-equipped or unprepared for such discussions, especially with faculty facing issues that were quite different than those they were more familiar with. Yet everyone agreed that at least an annual meeting with all faculty, including senior faculty, to review career plans and prospects was important and could avoid misunderstandings or even crises for individuals and organizations.

We focused on the issue of faculty transitions a few years ago first by acknowledging its importance and then by assessing its impact and coming up with recommendations and resources. We now recognize that there is more work to be done to implement an annual review and planning process for all faculty, regardless of the stage of the career. We further recognize that how this is done requires additional discussion and reflection, which we will share in future Newsletters.

Conflicts of Interest in Clinical Care Policies Further Codified by the AAMC

Stanford has been a leader in recognizing the importance of financial conflict of interests in research, education and patient care. In a number of ways the policies established by our faculty and endorsed by our community have helped set a national standard. National organizations including the Association of American Medical Colleges (AAMC) and the Institute of Medicine of the National Academy of Sciences have also set national expectations, guidelines and policies. The most recent is the June 30th report by the AAMC that “urges US teaching hospitals to establish policies that manage financial relationships between physicians and industry so that they do not influence patient care” (see: *In the Interest of Patients: Recommendations for Physician Financial Relationships and Clinical Decision Making*. https://services.aamc.org/publications/showfile.cfm?file=version163.pdf&prd_id=303&prv_id=375&pdf_id=163). Dr. Harry Greenberg, Senior Associate Dean for Research and Joseph D Grant Professor in the Department of Medicine, served on the advisory committee that formulated the

AAMC report. Dr. Greenberg has also been among the leaders who developed Stanford's *Policy and Guidelines for Interactions between the Stanford University School of Medicine, the Stanford Hospital and Clinics, and Lucile Packard Children's Hospital with the Pharmaceutical, Biotech, Medical Device, and Hospital and Research Equipment and Supplies Industries ("Industry")* that can be found at <http://med.stanford.edu/coi/siip/policy.html>.

In nearly every way Stanford has already enacted the recommendations of the AAMC, and our experiences have been endorsed and followed by an increasing number of peer institutions. It is inevitable that similar policies will be implemented nationwide. While you can review the details of the report, I am noting below the recommendations (with my highlighted emphasis) so that you are familiar with the major topics of focus:

- Compensation mechanisms of academic medical centers should be aligned with the best interests of patients.
- ***Medical societies*** should set standards of addressing their own relationships with industry.
- Academic medical centers should address their ***physicians' financial relationships with industry*** in the context of the clinical care they deliver.
- Academic medical centers should address ***institutional financial relationships with industry*** in the context of the clinical care they deliver.
- Academic medical centers should ***disclose the industry*** ties of their physicians to their patient communities as one method, though not the exclusive method, of managing actual and perceived conflict of interest in clinical care.
- Academic medical centers should ***involve their patient communities*** in determining the manner in which financial relationships of its physicians and of the institution itself should be made available to patients.

This is a continually evolving issue – which has both good and troublesome features. I well recall a comment made a few years ago warning that if doctors and academic centers did not take charge of financial conflicts, legislation would do so. In part that has now happened as part of the healthcare legislation that put the Physician Payments Sunshine Bill proposed by Senators Grassley and Kohl into law. Unfortunately, compliance regulations can also become too stringent and imposing, as appears to be the case with the current Notice to Proposed Rulemaking concerning *Responsibility of Applicants for Promoting Objectivity in Research for Which Public Health Funding is Sought and Responsible Prospective Contractors*, which was published in the May 21, 2010 Federal Register. In this case the proposed rules would prove extremely difficult and costly to implement and would have unclear benefits. To a certain extent they represent a response to political forces, and they show how policies can be imposed if academic centers are seen as less compliant or responsive to perceived conflicts of interests. Stanford and many other organizations are offering comments to this proposed rulemaking.

SHC Medical Executive Committee Offers Thanks and Appreciation to Martha Marsh

On July 7th Martha Marsh attended her last Medical Executive Committee (MEC) meeting as President and CEO of Stanford Hospital & Clinics. She retires officially at the end of August. In recognition of Ms. Marsh's eight years of service to Stanford Medicine, Dr. Steve Galli, Mary

Hewitt Loveless, MD, Professor and Chair of the Department of Pathology, proposed a motion to the MEC upon the request of Dr. Bryan Bohman, SHC elected Chief of Staff. The motion was passed unanimously by the committee, and, since it captures the sentiments and views of the medical staff, I thought it would be nice to share it with you. Drs Galli and Bohman agreed that this motion could be published in the Dean's Newsletter.

I've (Dr. Steve Galli) been a member of this group long enough to know that when Martha Marsh arrived as CEO and president of SHC in 2002, the institution had recently emerged from the merger of Stanford and UCSF in what could be called "guarded condition" (and that is putting it mildly), and she learned that there was less than two weeks of cash on hand. I understand that there is a technical financial term for this situation: "Not good." To make a long story short, Martha's leadership resulted in a remarkable turn-around for SHC, that has a \$1.9 billion operating budget in 2009-10, that has enjoyed four bond upgrades in nine years, and that now has 200 days of cash on hand.

However, Martha's most important contributions have gone far beyond restoring financial stability. Along with being named to *U.S. News & World Report's* Best Hospitals list for the past eight years, SHC was selected as one the country's top hospitals in 2009 by The Leapfrog Group for "delivering the best quality care in the nation while attaining the highest levels of efficiency." During her tenure Martha enhanced hospital services to include a new cancer center, an outpatient center in Redwood City, and an electronic medical record system that earned the hospital the highest designation level — Stage 7 — from HIMSS Analytics Database, the industry organization focused on the use of information technology in health care. Stanford Hospital is the fourth health-care organization and one of only six nationwide among more than 5,000 in the HIMSS Analytics Database to achieve this top-level designation.

In commenting on Martha and her accomplishments as CEO, Mariann Byerwalter, chair of the SHC Board of Directors, said: "Martha has been an extraordinary leader for Stanford Hospital & Clinics and has transformed the hospital in every area of performance. We are all extremely grateful to her and proud of the accomplishments she has achieved."

To convey the MEC's appreciation to Martha, I propose the following motion:

Motion: The Medical Executive Committee, on behalf of itself, the medical staff and employees of Stanford Hospital & Clinics, and the patients we serve, wish to thank Martha Marsh deeply for her eight years of leadership of SHC as CEO, for her unflagging efforts to ensure that SHC provide the highest standards of excellence in patient care, for her determined and effective restoration of the financial health of SHC, for her vigorous pursuit of improvements in SHC facilities, operations, programs, quality of care, information technology, and patient services, and for her work with Dean Phil Pizzo and LPCH CEO Chris Dawes in their efforts to make Stanford University Medical Center much more than the sum of its parts. If one of the tests of effective leadership is leaving an institution in better shape than one found it, there can be no doubt that Martha Marsh has passed that test with flying colors. The MEC wishes all the best for Martha and her family as she enters the next phase of her life, and bids her farewell rather than goodbye, hoping to see her return to Stanford to witness the completion of the new hospital which she got off to such a good start.

Motion: The Medical Executive Committee, on behalf of itself, the medical staff and employees of Stanford Hospital & Clinics, and the patients we serve, wish to thank Martha Marsh deeply for her eight years of leadership of SHC as CEO, for her unflagging efforts to ensure that SHC

provide the highest standards of excellence in patient care, for her determined and effective restoration of the financial health of SHC, for her vigorous pursuit of improvements in SHC facilities, operations, programs, quality of care, information technology, and patient services, and for her work with Dean Phil Pizzo and LPCH CEO Chris Dawes in their efforts to make Stanford University Medical Center much more than the sum of its parts. If one of the tests of effective leadership is leaving an institution in better shape than one found it, there can be no doubt that Martha Marsh has passed that test with flying colors. The MEC wishes all the best for Martha and her family as she enters the next phase of her life, and bids her farewell rather than goodbye, hoping to see her return to Stanford to witness the completion of the new hospital which she got off to such a good start.

Improving the Patient Experience

Academic medical centers should be graded on how well they do in several key areas. Innovation, including both discovery and the translation of knowledge from research to the patient, is a defining feature of an academic medical center and is one where Stanford does particularly well. Another is the delivery of state-of-the-art medical care, and here Stanford does quite well and has made numerous strides, particularly in the last decade. We still have work to do in recruiting and developing excellence in the broad dimensions of clinical medicine – which is especially challenging for a small medical center. Third, medical care needs to be delivered with outstanding quality and in the safest ways possible. This is always a challenge when the complexity of care is high and the number of providers multiple and variegated. Stanford has made considerable progress in improving and even leading in this area over the last years.

A fourth key area, which works in conjunction with outstanding quality in the delivery of care, is the creation of a setting in which the patient experience and service are exemplary and appreciated. Here we have done more poorly and certainly inconsistently. There are outstanding examples of success but too many of suboptimal performance – by the entire medical team and the institution – which also needs to include service in ambulatory as well as inpatient settings. We need to do better. And fifth, the cost of care needs to be as low as possible and competitive with other providers to make value added meaningful and successful.

Each of these key components (innovation, state-of-the-art patient care, high quality, outstanding patient service and competitive cost) is important both individually and as a component of our overall success as an academic medical center. They are all critical, although their perceived values will impact constituents differently. For example, we will be evaluated by our academic peers on the depth and excellence of our discoveries and innovations. The expertise of our physicians and providers will affect our reputation among our clinical colleagues and will impact referrals and clinical interactions. Patients and our community will judge us by how well we do in service and the quality of their experience, whether in outpatient or inpatient settings. In many ways the patient experience can have an even larger impact on perceived value than whether we are great in innovation or other facets of academic medicine. And of course payers, both public and private, will assess us on cost, although this will increasingly be combined with quality and clinical outcomes. Many of these changes will unfold over the next decade as healthcare insurance reform, provider reform and cost control converge to change the landscape of medicine in the USA. These are changes that need to happen – but they will be challenging.

While we have lots of work to do, the first step in progress is recognition of the need for change. Evidence of this is clearly present in the types of recruitments that clinical departments have made in recent years or that they are planning for the future. The combined efforts of the hospital and school have led to improvements in quality and clinical outcome, but much work remains to be done. It is our intent to make considerable progress in the areas of cost, efficiency, effectiveness and provider delivery through the new Clinical Effectiveness Research Center that has been recently established and that will be led by Dr. Arnie Milstein (see: http://deansnewsletter.stanford.edu/archive/05_24_10.html#2). In addition, over the past several months a new effort shared by SHC and the School of Medicine on “The Patient Experience” has been established as a major initiative that will focus on all sites and programs of Stanford Medicine. This includes ambulatory programs for which a new outpatient clinic program and Clinical Advisory Council has been established, the first meeting of which was held on July 19th.

It is our expectation that these concerted efforts will improve the overall patient experience and the quality, effectiveness and cost of care at Stanford Medicine. An important aspect – and indeed a key ingredient – will be the necessary cultural transformation by all of us to focus on a more patient centric care model, something I wrote about in the December 1, 2008 Newsletter in a piece entitled “Professionalism and Patient-Centricity (see: http://deansnewsletter.stanford.edu/archive/12_01_08.html), much of which is still timely and relevant today. Within that context I was pleased to see the message from Drs. Ann Weinacker, Vice Chief of Staff, and Bryan Bohman, Chief of Staff, offering vignettes and insights on this critically important issue. I am taking the liberty of copying it below and hope each of you will think about it with serious intent.

FROM DRS ANN WEINACKER AND BRYAN BOHMAN TO THE MEDICAL STAFF

It is easy to get so caught up in the work of taking care of patients that we forget the common courtesies of quality care. But try this: Introduce yourself to every patient you care for, and include the nurses in your rounds every day. These are two initiatives currently underway on all inpatient services at Stanford, and are designed to improve patient satisfaction with their care. Unfortunately we have a long way to go to make our patients as comfortable as they should be. When asked to comment on his experience here, one patient said, “The doctor who took call for my surgeon on a day off never even introduced himself – just barged in and pulled up my gown.” Another said, “Don’t you guys ever talk to each other?”

We must begin to communicate better with each other, with patients, and with nurses. Soon, all SHC attendings, housestaff, fellows, and students will have baseball card style “team cards” to distribute to patients to help them to know who their doctors are, but that is only the beginning of communicating effectively. It is also important to tell patients what role you play on their health care team and who will cover for you when you are off or leaving the service, to let them know what tests they will have and when they will get the results, and to actively include nurses when making rounds and discussing patient care. As simple as it sounds, these things are not routine practice in our hospital, but they can ultimately make patients happier and save you and the nurses valuable time.

Compared with other academic medical centers, our patient satisfaction scores put us in the bottom 30 percent for inpatient and Emergency Department care and the bottom 10 percent for

outpatient care. Our greatest shortcomings relate to our failure to recognize patients as people who are vulnerable, uncomfortable, and often afraid of how an illness will change their lives. Most inpatients at Stanford have so many doctors involved in their care that many of them can't identify who is in charge. Introducing ourselves consistently and including the nurses as we make plans won't solve all our problems, but it's a start. We still have a lot of work to do.

If you have ideas for improving the patient experience at Stanford, we would like to hear your suggestions. Thanks.

Stanford Medicine and the Future of Teaching Hospitals and Medicine

The summer issue of *Stanford Medicine* (<http://stanmed.stanford.edu/2010summer/>), a collaborative project between the Stanford School of Medicine and the Stanford Hospital & Clinics, looks at the "*Metamorphosis of Teaching Hospitals*" and the lessons they can teach us during the era of healthcare reform. Thanks again to the fine editorial work of Roseann Spector and Paul Costello, this issue addresses a wide range of topics, including a timely and thoughtful report by Jonathan Rabinovitch entitled Transformers (see: <http://stanmed.stanford.edu/2010summer/article1.html>) that reviews the intersections of evidence based medicine, quality and performance, information technology and the culture of clinical - it is definitely worth reading.

Awards and Honors

- Thanks to a unique collaboration between Professor Rob Jackler, Chair of Otolaryngology/Head and Neck Surgery, and Professor Eric Knudsen, Department of Neurobiology, both holders of Sewall Professorships, endowment funds from these professorships were recently combined to create two new Sewall Professorships. These new professorships were bestowed on:
 - **Dr Stefan Heller**, Sewall Professor of Otolaryngology and of Molecular and Cellular Physiology, and
 - **Dr. Tony Ricci**, Sewall Professor of Otolaryngology and Molecular and Cellular Physiology.

Please join me in congratulating Professors Heller and Ricci and in thanking Professors Jackler and Knudsen, all now united in sharing the appellation of a Sewall Professor in the School of Medicine.

- **Dr. Wing Hung Wong** has been elected as a member of Academia Sinica, the national academy of the Republic of China (Taiwan). It supports research activities in a wide variety of disciplines, ranging from mathematical and physical sciences, to life sciences, and to humanities and social sciences. Congratulations to Professor Wing Wong.
- **Scope**, produced by the **School of Medicine's Office of Communication and Public Affairs**, has one first place in the "Halls of Research" category in the 2010 Health and Life Medical Blog Awards, which recognize the top blogs run by academic institutions that make medical issues accessible to the general public. Congratulations to Scope and the Office of Communication and Public Affairs.
- **Dr. Jonathan S. Berek**, Professor and Chair of the Department of Obstetrics and Gynecology, and the Director of the Women's Cancer Center of the Stanford Cancer Center, has been given the **2010 John C. Fremont Pathfinder Award**. The annual

award “honors native Nebraskans who have made outstanding contributions to mankind that exemplify the vision and courage of John C. Fremont.” The award was conferred this month at a special ceremony in Fremont, Nebraska. Congratulations to Dr. Berek.

- **Dr. Raj Rohatgi**, Assistant Professor of Medicine and by courtesy, of Biochemistry, has been awarded the 2010 Pew Scholar in Biomedical Sciences. Congratulations to Dr. Rohatgi.
- **Dr. Julie Theriot**, Associate Professor of Biochemistry and of Microbiology and Immunology, has been awarded the Kaiser Foundation Award for Excellence in Preclinical Teaching. Congratulations to Dr. Theriot.
- **2010 OCH CTSA Seed Grant Awards:** The Office of Community Health (OCH) is pleased to announce the recipients of the 2010 OCH CTSA Seed Grants. This funding will be used to form new community-based partnerships, enhance existing partnerships or support the development, implementation or evaluation of a community-based research project. This year’s award recipients include:
 - **Lisa Chamberlain**, MD, MPH, Assistant Professor of Pediatrics, School of Medicine and **Elizabeth Barnert**, MD, MS Pediatric Resident, School of Medicine, partnering with **The Mind Body Awareness Project** for: Evaluation of a one-day intensive mindfulness-based training program for incarcerated youth in San Mateo County.
 - **LaVera M. Crawley**, MD, MPH, Assistant Professor of Pediatrics, Stanford Center for Biomedical Ethics, partnering with **Circle of Care Program, East Bay Agency for Children** for: Building Mutual Capacity for Community-Based Outcomes Research in Pediatric Bereavement.
 - **Sun H. Kim**, MD, MS, Assistant Professor of Medicine, Stanford University Medical Center, partnering with **San Mateo County Behavioral Health and Recovery Services** for: Improving Metabolic Health in Patients with Severe Mental Illness.
 - **Abby C. King**, PhD, Professor of Health Research and Policy and Medicine, Acting Director, Stanford Prevention Research Center, School of Medicine and **Christopher D. Gardner**, PhD, Associate Professor of Medicine, Stanford Prevention Research Center, School of Medicine, partnering with **San Mateo County Health System and BRIDGE Housing Corporation** for: Developing Community Participatory-Based Neighborhood Audit Tools to Promote Healthful Eating and Active Living in Local Counties.
 - **Dee W. West**, PhD Professor, Department of Health Research and Policy, School of Medicine and **Bang Hai Nguyen**, DrPH, Consulting Assistant Professor, Department of Health Research and Policy, School of Medicine, partnering with **Community Health Partnership** for: Sustaining Community-Academic Partnerships to Conduct Community-Based Participatory Research.

Congratulations to all of the OCH CTSA Seed Grant recipients!

Appointments and Promotions

Gregg A. Adams has been promoted to Clinical Assistant Professor (Affiliated) of Surgery, effective 10/10/09.

Robin F. Apple has been reappointed to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 6/01/10.

Julius A. Bishop has been appointed to Assistant Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 8/01/10.

JW Randolph Bolton has been reappointed to Clinical Assistant Professor of Cardiothoracic Surgery, effective 7/01/10.

David B. Camarillo has been appointed to Assistant Professor of Bioengineering, effective 9/1/11.

Zhen Cheng has been reappointed to Assistant Professor (Research) of Radiology, effective 9/1/10.

Susan Crowe has been reappointed to Clinical Assistant Professor of Obstetrics and Gynecology, effective 7/01/10.

Maximilian Diehn has been appointed to Assistant Professor of Radiation Oncology, effective 7/1/10.

Martha R. Dorn has been reappointed to Clinical Assistant Professor (Affiliated) of

Genevieve D'souza has been promoted to Clinical Assistant Professor of Anesthesia, effective 7/01/10.

Rajesh Dtoh has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 7/01/10.

Nattoha Funck has been reappointed to Clinical Assistant Professor (Affiliated) of Anesthesia, effective 9/01/10.

Rajnish A. Gupta has been appointed to Clinical Assistant Professor of Dermatology, effective 7/01/10

Jon-Erik Holty has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 5/01/10.

Christine A. Keeling has been appointed to Clinical Assistant Professor (Affiliated) of Radiology, effective 7/01/10

Ruth B. Lathi has been reappointed to Assistant Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 7/01/10.

Theodore Leng has been promoted to Clinical Assistant Professor of Ophthalmology, effective 7/01/10

Eleanor G. Levin has been reappointed to Clinical Professor (Affiliated) of Medicine, effective 9/01/09.

Jafi A. Lipson has been appointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 8/01/10.

Richard D. Mainwaring has been reappointed to Clinical Assistant Professor of Cardiothoracic Surgery, effective 7/01/10.

Melanie A. Manning has been reappointed to Clinical Assistant Professor of Pathology and of Pediatrics, effective 8/01/10.

David G. Mohler has been promoted to Clinical Professor of Orthopaedic Surgery, effective 12/01/10.

Mindie H. Nguyen has been reappointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 7/01/10.

Michael J. Ostacher has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Veterans Affairs Palo Alto Health Care System, effective 7/01/10.

Ravi Prtoad has been reappointed to Clinical Assistant Professor of Anesthesia, effective 9/01/10.

Ruchir Shah has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 5/01/10.

Lawrence C. Siegel has been reappointed to Clinical Assistant Professor (Affiliated) of Anesthesia, effective 9/01/10.

Geeta Singh has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/01/09.

Marc Thibonnier has been appointed to Clinical Professor (Affiliated) of Medicine, effective 5/01/10.

Wolfgang Winkelmayr has been appointed to Associate Professor of Medicine, effective 7/1/10.

David J. Wong has been appointed to Clinical Assistant Professor of Dermatology, effective 7/01/10.

Paul Cameron Zei has been promoted to Clinical Assistant Professor of Medicine, effective 8/01/10.

Dean's Newsletter **August 30, 2010**

A New Year Begins With Something Old and Something New

On August 18th we welcomed 86 new medical students for the 2010 Orientation, with first quarter classes beginning on Monday, August 23rd. Once again, we are fortunate to have a highly selected group of students – we had 5873 applicants for 86 matriculating students (1.5%). The class is comprised equally of men and women. Eight students are entering as part of the MSTP (Medical Science Training Program – or MD/PhD program). Three of the incoming class already have PhD degrees, 10 have Master degrees and one has a JD degree. The majority of the students concentrated in the biological, physical or engineering sciences as undergraduates – but ten were non-science majors. Although they come from 29 colleges and universities, three institutes account for half of the class (20 students graduated from Stanford, 16 graduated from Harvard and 7 from UC Berkeley). Approximately 15% are from three other universities (MIT [5 students], Johns Hopkins [4], Yale [4]) and two each are from seven other universities (Duke, Princeton, U Arizona, UCLA, UCSD, USC, U Wisconsin). The remaining sixteen students come from 16 other colleges or universities, including Arizona State U, Bethany College, Carnegie-Mellon, Columbia, CSU Long Beach, Haverford, LSU, Loyola Chicago, Northwestern, Oberlin, Swarthmore, U. Illinois Chicago, U Miami, U New Mexico, Washington U and Whitman College.

The class is diversified by underrepresented in medicine students as well as place of birth (20% respectively). In addition to the USA (with students coming from 23 states), 29 (34%) students were born in one of 18 other countries. Importantly, 23 of the incoming students spent time in research or service work in other nations – a testament to their interests in global health and a reminder of our increasingly global community in science and medicine. I want to thank Dr. Gabe Garcia, Associate Dean for MD Admissions, and the faculty and students who participated in the admissions process for their time, skill and wisdom in selecting another outstanding class of Stanford medical students.

The incoming class is the first to be oriented and begin classes in the new Li Ka Shing Center for Learning and Knowledge (LKSC) and while the sounds of construction still herald the final completion of the building, its innovations and importance to the future of medical education still shine brightly. Orientation began with a welcome from Paul Berg, the Robert W and Vivian K Cahill Professor Emeritus, who reflected on the impact of the move of the medical school to the Stanford campus in 1959 – something he and a number of his colleagues took part in. Dr. Berg highlighted the unique connections of the medical school to the university and the impact of these physical relationships on education, research and patient care. Indeed, the past 50 years have been transformative for Stanford Medicine and the University – something that Dr. Berg and his many colleagues help to nucleate, foster and facilitate. Looking forward, we all hope that the next 50 years and more will be equally transformative and that the LKSC will contribute to that outcome.

During the orientation, this year's new medical school students received "something old and something new." The "new" (of course, in addition to the LKSC) is an iPad for each student designed to serve as the repository of class syllabi, a route to on-line journals, texts and learning tools – and a look into the future of technology and education. A number of stories have appeared about our decision to provide iPads – which the school purchased – including the following press release: <http://med.stanford.edu/ism/2010/august/ipad.html>.

The "something old" (at least relatively) is a stethoscope. At the conclusion of orientation on Friday evening, August 20th, we held the 2010 Stethoscope Ceremony, sponsored by the Stanford University Medical Alumni Association, the School of Medicine and The Arnold P. Gold Foundation (see: <http://humanism-in-medicine.org/>), which promotes humanism in medicine. Of interest, this past June we announced the formation of the Arnold Gold Humanism Honorary Society at Stanford and its first inductees (see: http://deansnewsletter.stanford.edu/archive/06_14_10.html#7).

As I pointed out in my opening comments at the Stethoscope Ceremony, most medical schools conduct a "White Coat Ceremony" to mark the initiation of a career in medicine. At Stanford the tradition has been to provide a stethoscope to incoming students – not only because it is the one piece of equipment that symbolizes the "doctor" but, even more importantly, because it fosters a connection between the patient and physician, whereas the white coat tends to distinguish (and perhaps inadvertently separate) the patient and physician. The stethoscope has been part of medical practice since its invention by Dr. Rene Laennec in 1816 in Paris and has gone through many changes in the 19th, 20th and 21st centuries. It may be of local interest to know that a modification of the stethoscope in the 1940s by Rappaport and Sprague created a two-side stethoscope (bell and diaphragm) and was initially manufactured by HP (Hewlett-Packard) before being spun out to Agilent and then to Phillips. In the 1960s Littmann (of Harvard) developed a lighter and more acoustically refined model of this type of stethoscope, the current version of which is the one we provided to our students at this year's Stethoscope Ceremony.

I also reminded students that their life in medicine would be filled with incredible opportunities and pathways – few of which could be imagined as they commenced their first exciting days of classes at Stanford. I witnessed my own career – which like that of many of my generation – has

taken unexpected turns through research, education, patient-care, advocacy and public policy and various leadership roles. Being open to change and preparing to lead change allows one to transform individuals, institutions and communities – something we hope that our students will embrace and exemplify.

In tandem with the evolution of one's personal life and career, I also reflected on the dramatic positive and some unfortunately negative events that have occurred in medicine and science during my personal chronology. The clinical and scientific advances have been breathtaking at virtually every level. Some fields have become less relevant whereas new ones, especially molecular biology, genetics, genomics, stem cell biology and bioinformatics, have emerged and transformed disease and system disciplines (such as cancer, neuroscience, regenerative medicine, immunology and cardiovascular, to name a few). These advances have led to new devices, drugs and technologies that have improved the diagnosis, management and prevention of human disease – but they have also served to increase the cost of medical care and, in some situations, have inadvertently caused a separation between the doctor and her patient. They have been further impacted by market forces that have attempted to commoditize medicine as well as a fee-for-service model that has created a number of perverse incentives for nearly every facet of the healthcare system.

Many of these realities are so entrenched that it has made healthcare reform in the United States a near impossibility. And while the Patient Protection and Affordability Act, signed into law by President Obama on March 24, 2010, begins to address health insurance reform along with other components of our costly and not truly functional healthcare “system” (or the lack thereof), we are still very much at the beginning of the journey toward healthcare reform. In addition to healthcare reform focused on patient access, major efforts are needed to address the healthcare provider side of the equation, including who provides care and where it is delivered. We are clearly moving from disease-based management that has been hospital and technology focused to a system that puts a greater emphasis on health and managing patients at home, in the community or ambulatory setting. In tandem there needs to be a greater emphasis on patient safety, on reducing errors and enhancing the quality outcomes of medical care, and on data driven medical decision making that is free from bias and influence, especially by the drug and pharmaceutical industry.

These changes in science, knowledge and clinical care will have a very significant impact on medical education. Coupling the art (and humanism) of medicine with science is ever more important for physicians and institutions, including academic medical centers like Stanford. Almost certainly, with the enormous economic and related pressures now being unleashed, institutions like Stanford will have to demonstrate their value to the communities they serve. In my opinion, this will be based on how well they serve as innovators and discoverers of new diagnostic, treatment and preventive strategies. How we are perceived will depend on whether we are seen as providing state-of-the-art medical care across numerous disciplines that is associated with high quality, outstanding patient service and low cost. Almost surely the patient as a consumer will expect institutions like Stanford to be innovative and to offer excellent state-of-the-art care. Patients are likely to be less aware of how cost effective we are, although that will almost surely change in the future. But they will likely assess our value by the quality of the

patient experience – not just their medical care but how they were treated as individuals and how the medical professionals they interacted with respected and valued them.

Other constituencies will assess us by metrics specific to their interests. For example, peer academic centers will likely pay the most attention to our excellence in discovery and innovation. Public and private payers for medical services will judge us on quality, safety, outcomes and costs. The bottom line is that we must be outstanding in each of these intersecting features, and we must be able to educate and teach the next generation of students in these principles and practices.

I also shared with our incoming students a few of the lessons I feel are important for future physicians. This is hardly an inclusive list, but it is a reasonable starting place and includes the following:

- Science is the foundation of clinical medicine. Because the pace of scientific discovery is ever accelerating, whatever knowledge is learned in medical school will need to be rejuvenated and even replaced in the years ahead. This means that medical school is the beginning of a journey filled with lifetime learning. This requires a commitment to continued education by physicians and the skills to judge new knowledge on its true merits.
- The patient needs to be at the center of learning and caring. While science and technology may shape the future of medical care, compassion, humanism and professionalism define the patient experience.
- Medicine needs to be reclaimed as a profession and not as a commodity. This requires a careful assessment of personal and institutional goals and values. It also means making professional integrity and avoidance of bias or financial influence a fundamental principle.
- Promoting the health of the patient and one's own personal health are equally important. Not only is personal health importance in facing the rigor of a career in medicine, how we behave as individuals also signals to patients what we value. I also took the liberty of signaling to our incoming students that medicine is a group and an individual activity and that it requires stamina, sustenance and endurance. Not surprisingly, a marathon is (in some ways) a metaphor for medical education and a career in medicine.

For example, as our students begin the first day of class they are very much part of a group and feel the excitement and exuberance of the starting line. They will feel more secure if they have prepared well. They also need to pace themselves – which is highly individualized. Some may sprint and then fade, others may go too slowly and some will be naturally speedy. All need sustenance along the way. And, while the group exuberance is great at the outset, everyone faces the isolation of individualization that comes later in the course – when the mind demons question why you are in this race and even whether you can finish. But if you have prepared well and built up your endurance, you will feel the excitement of seeing the finish and completing the race.

In some ways a marathon is a metaphor for the first day of medical school as a whole – then the first week, month, year and beyond. If you build on past performance and sustain your pace of learning and activity, each new horizon becomes a new “race” that, when linked with the next one and the one after that, defines a career in medicine: lots of opportunities for group and team interaction as well as many lonely and stressful moments – leading to the satisfaction of a job well done. OK, maybe a little hokey, but the metaphor has certainly been a help to me over the years.

- Finally, I emphasized to our students the importance of being leaders and of taking a stand on behalf of their patients, institutions, communities and beyond. It is our hope that each of our students will be leaders and in their own ways, transformers of science, medicine and society.

At the conclusion of the Stethoscope Ceremony we asked our incoming medical students, along with any other MDs in attendance, to read the Stanford Affirmation. This is also something old and something new since it derives from the Hippocratic Oath but has been modernized at Stanford to make it more contemporaneous and relevant. The last time I read the Affirmation was at Commencement in June, and our new students will next read it when they receive their MD degree. Given all the issues and challenges in medicine, some noted above, I am struck by how many of the principles in this affirmation still speak to the profession of medicine in a light that I hold valuable – truly something old that is still new. I have copied the affirmation below in case you haven’t seen or read it in some time.

On my admission to the Practice of Medicine I pledge to devote my life to the service of humanity.

The care of my patients will be my first consideration.

I will strive to acquire and share new knowledge with my colleagues and my patients;

I will practice my profession with conscience and dignity, and to the best of my ability and judgment.

I will approach each patient with charity, attention, humility, and commitment;

I will hold all life dear, and let knowledge, wisdom, courage, and compassion guide my therapy;

I will use my medical knowledge and skills to promote human rights, social justice, and civil liberties;

I will not permit considerations of age, disease or disability, faith, ethnic origin, gender identity, nationality, race, sexual orientation, social standing or other forms of discrimination to intervene between my duty and my patient;

I will respect the confidences with which I will be entrusted;

I will give gratitude and respect to those from whom I have learned my Science and my Art;

I will uphold the integrity of the medical profession;

I will cultivate peace in both personal conduct and political expression;

I will not use my knowledge contrary to the spirit of this Affirmation.

I make these promises in witness of those who have stood here before me, and those who will come after, solemnly, freely, and upon my honor.

Thinking About Medical Education for the Future

In the May 14th Dean's Newsletter

(http://deansnewsletter.stanford.edu/archive/05_03_10.html#2) I outlined our commitment to thinking critically and creatively about education – for medical and graduate students and for postdoctoral fellows. As I noted, we planned three separate “think tanks” that would be followed by work groups to explore each of these discrete but interconnected domains of education. The goal is to assess where we are now and how we can transform the future of medicine and science through our education programs. We held our Think Tank on Postdoctoral Fellows and Scholars on July 17th (see <http://deansnewsletter.stanford.edu/#2>) and on Saturday, August 28th, we held our Think Tank on Medical Student Education. As with the first think tank, the one on medical student education was incredibly rich in content and discussion. Over 45 students, faculty and staff participated actively and enthusiastically in animated and creative discussions. We benefitted from having Dr. David Irby, Professor and Vice Dean for Medical Education at UCSF, join us along with Dean Jim Plummer from our School of Engineering and Richard Saller, Dean of the School of Humanities and Sciences at Stanford.

Dr. Charles Prober, Senior Associate Dean for Medical Education and I began by framing the issues, after which we engaged in an open discussion about the ways that medical education could be improved. We then turned to the more important question of how MD education could be transformed and how we might construct the program if we were starting anew. This year is the centennial of the 1910 Flexner Report that guided medical education in the 20th century, so it is timely to ask how we can be transformative for the 21st century and what is the unique role that Stanford can play in this process.

Over the next days we will be sharing some of the fruits of our discussion with the participants of the August 28th Think Tank. I will then summarize our discussion and preliminary thoughts and considerations and share them with you – for information as well as comment – in my next Newsletter. We are at a point where we can be truly transformative, and I very much hope we can engage in a rich dialogue about how we can proceed. Once we have had this communication, we will be developing work groups to refine and deepen specific issues and topics – with the goal of having a presentation for our Leadership Retreat in January 2011. I will do my best to keep you engaged through this process.

Stanford Society of Physician Scholars

On August 26th the inaugural meeting of the Stanford Society of Physician Scholars (SSPS) (see: <http://ssps.stanford.edu/>) was held in the Li Ka Shing Center for Learning and Knowledge. This is a joint program of our clinical department chairs and residency program directors with the

Office of Medical Education. Dr. Charles Prober, Senior Associate Dean for Medical Education, serves as SSPS Director, and Dr. Robert Ohgami, a resident in the Department of Pathology, is the Associate Director. The SSPS “focuses on the academic development of fellows from Clinical Departments across the School of Medicine” and is designed to foster interactions of residents and fellows from different disciplines as well as with students and faculty. The ultimate goal is to create bridges and connections between undergraduate medical education and graduate and postgraduate trainees with the hope of fostering a continuum of education and collaboration. This will be done by regular informal gatherings as well as formal seminars about topics relevant to careers in academic medicine. I had the opportunity to give the leadoff presentation and focused on issues that should be considered in developing a successful academic career.

Residents are selected for the SSPS program by their department chairs based on their interest in pursuing an academic career. While we view this new program as an experiment, I am very enthusiastic about its relevance and importance. Based on the turnout at the first meeting and the feedback received to date, so are the residents and faculty – which bodes well for the future success of this new initiative.

Embryonic Stem Cell Research: Déjà Vu All Over Again

Two weeks ago I was inviting some leading faculty to participate in a symposium on stem cell biology and regenerative medicine at an upcoming national meeting. An invitation was extended to a noted ethicist who replied that there would be not much for her to discuss since the issues and problems with embryonic stem cell research had pretty much been resolved. Then, almost out of the blue came the decision by Chief Judge Royce Lamberth of the Federal District Court for DC that halts federal funding for embryonic stem cell research (see http://www.nytimes.com/2010/08/24/health/policy/24stem.html?_r=1). While there is still uncertainty about what this ruling truly will mean, and while efforts are underway to overturn the injunction, scientists and institutions are trying to figure out what, if any, federally funded research can proceed. Individuals and institutions have offered their opinion about this ruling (see: <http://scopeblog.stanford.edu/archives/2010/08/concern-over-stem-cell-ruling.html>), and national professional organizations including the Association of American Medical Colleges, the Association of American Universities, Association of Public and Land-Grant Universities and the Council on Government Relations, are responding to the injunction on embryonic stem cell research with the following shared statement:

The judicial injunction blocking federally funded human embryonic stem cell research not only blocks potential life-saving research but also threatens to undermine the system of peer-reviewed science that has helped make America the unquestioned world leader in scientific discovery.

Embryonic stem cell research holds enormous potential for developing treatments and cures for numerous chronic and fatal diseases. With scientists across the nation positioned to make dramatic advances funded substantially by the National Institutes of Health, this judicial action is particularly disappointing. We hope this injunction will be lifted soon and that the lawsuit will be unsuccessful. As these court actions have made clear, it is imperative that policymakers clarify that federal law unambiguously permits the funding of this critical research.

We are also deeply concerned that the researchers who are plaintiffs in this case have been granted standing to sue the government based primarily on the assertion that they would be “irreparably harmed” by continued funding of embryonic stem cell research. This is judicial intervention in the peer review process, pure and simple. The notion that competition for research funding should be adjudicated in the courts rather than by expert peer review endangers the merit-based system of funding that makes American science the envy of the world. We strongly encourage the federal government to argue forcefully in court against permitting the peer review system to be undermined in this manner.

Needless to say I share this view. And while we will be less impacted because of the California Institute of Regenerative Medicine (CIRM) due to Prop 71, this ruling represents another setback and source of confusion and lost opportunity. Hopefully it will be short-lived. But it affirms that the issues and objections to embryonic stem cell research have certainly not been resolved.

Supporting Clinical and Translational Research

Dr. Harry Greenberg, Senior Associate Dean for Research, asked me to share some good news about a new agreement between Spectrum (<http://spectrum.stanford.edu/>) and both Stanford Hospital & Clinics (SHC) and the Lucile Packard Children’s Hospital (LPCH) to help support the costs of clinical research. As Dr. Greenberg notes, “in recent years the rising cost of medical care has made it increasingly difficult to fund the patient care components of clinical and translational research. The problem has been particularly severe for clinical investigators at academic health centers like Stanford, where patient care costs are among of the highest in the country. While these costs have been discounted at Stanford Hospital for research purposes for many years, the traditional hospital research discounts on the order of 40-50% often have left Stanford investigators at a competitive disadvantage, threatening their ability to conduct research at our affiliated facilities.”

Dr. Greenberg goes on to say, “beginning in 2006, representatives of Spectrum have worked with SHC and LPCH to increase research discounts and lower research clinical care costs. We are pleased to announce that Spectrum and the Hospitals have finalized and updated a new Clinical Trials research discount structure for technical services (supplies, procedures, and laboratory services, etc). Effective July 1, 2010, the updated discount structure provides these research related patient care activities essentially at cost, without markup of any kind, thus reflecting the hospital’s ongoing commitment to clinical and translational research at Stanford.”

Along with Dr. Greenberg I would like to thank the SHC and LPCH Leadership for their alignment with and continued support for our shared research mission.

Center for Biomedical Imaging Seed Grants

The Center for Biomedical Imaging at Stanford (see: <http://cbis.stanford.edu/about/>), led by Dr. Kim Butts Pauly, Professor of Radiology, announced the 2010 Seed Funding recipients. As with other School of Medicine seed funding programs, this is designed to foster broad interschool collaboration and cooperation in imaging sciences. There were 53 applications and seven awards, including two outside the School of Medicine (Engineering and Humanities & Sciences).

Faculty Principal Investigator	Department/School	Topic
Colin Carpenter, PhD	Radiation Oncology	Tri-modality Molecular Surgical Guidance Integrated into a Laparoscope
Mark Cutkosky, PhD	Mechanical Engineering	Development and testing of tools with opto-thermal actuation for MRI-guided interventions
Michael Hsieh, MD, PhD	Urology	Single Cell Magnetic Resonance Imaging of Infections Using Bacterial Magnetite
Anita Koshy, MD	Internal Medicine	Using imaging to determine how and why <i>Toxoplasma gondii</i> injects rhoptry proteins it does not invade
Michael Lin, MD, PhD	Pediatrics, BioEngineering	Chemistry-based engineering of autocatalytic fluorescent proteins for whole-animal imaging in the optical window
Andrew Quon, MD	Radiology	¹⁸ F-Sodium Fluoride PET/CT for the pre-surgical evaluation of back pain
Mark Schnitzer, PhD	Applied Physics	Integrated fluorescence microscopes based on CMOS image sensors for teaching digital imaging in the microscopy courses at Stanford University

Congratulations to the seed grant winners and special thanks to Dr. Pauly and her colleagues.

Remembering Dr. Ted Harris

On Tuesday, August 24th we held a memorial service to honor and celebrate the life of Edward D Harris, Jr, MD. Ted Harris died on May 21st following a long battle with cancer. Ted was a much beloved colleague and friend of Stanford Medicine and the University. He was recognized for his significant contributions as a teacher, mentor, investigator, clinician and leader of institutions and national organizations. He served as Chair of the Department of Medicine from 1987-1995 and as Academic Secretary to the University Faculty Senate from 2002-2007.

We had the opportunity to witness Ted Harris's contributions as a physician, scholar, athlete, musician, parent and grandparent through the reflections of institutional leaders, family, friends and colleagues. The beginnings of a portrait of Ted emerged through the initial comments of Provost John Etchemendy and Chair of Medicine Ralph Horwitz. These were complemented and enriched by more personal reflections from Ned Harris, one of Ted's three sons, and Dr. Bill Rogoway, a close friend and colleague over many decades. Sheri Sheppard, Professor of

Mechanical Engineering, shared reflections from the Faculty Senate, including her own observations when she served as Senate chair during Ted's final year as Academic Secretary. Dr. Rex Jamison, a long time colleague of Ted from Boston to Stanford and his successor as Academic Secretary, offered his reflections about Ted as well as excerpts from Ted's own Senate Minutes that reflected both his keen wit and his generous spirit. Finally, Dr. Mark Genovese, Professor of Medicine, reflected on the important role that Ted played in his own life and career as a mentor and teacher.

Taken together, a rich fabric of excellence was depicted and appreciated by the many family, friends and colleagues who attended the memorial service. I want to thank the Rev. Joanne Sanders, Associate Dean for Religious Life, for her own comments and reflections at the beginning and ending of the program. Finally, I want to thank Kathy Gillam, Kristin Goldthorpe, Mira Engel and Terri Tarantino for their efforts in put putting the program together.

Thanks to Dr Alan Schatzberg

On Monday, August 23rd we held a reception to thank and honor Dr. Alan Schatzberg for his incredible contributions during his tenure as Chair of the Department of Psychiatry and Behavioral Sciences since 1991. Prior to joining Stanford, Dr. Schatzberg had already established a distinguished career at Harvard as a leading investigator in the biology and treatment of depression. Over the past 19 years he developed one of the finest departments of psychiatry in the nation, hallmarked by every important metric and measure of excellence. He has recruited superb faculty and helped nurture and enhance their careers. He has provided a strong scientific foundation for the department that is recognized worldwide for its excellence in research and innovation. Dr. Schatzberg and his colleagues have recruited, trained and developed some of the most outstanding physician-scientists focused on mental illness and behavior in the country and, indeed, in the world. In addition, he has championed clinical excellence and fostered a department that has excelled in the care of adults and children with psychiatric illnesses.

In addition to his contributions to the Department, Dr. Schatzberg has excelled as in investigator and leader in his field and in medicine. He is renowned for his research in depression and is the author of more than 600 publications and several books. He is an elected Member of the Institute of Medicine of the National Academy of Sciences and has held numerous important leadership positions, including Past President of the American College of Neuropsychopharmacology, the Society of Biological Psychiatry and most recently, the American Psychiatric Society. He has received numerous awards and honors.

One of the best accolades is the respect of one's peers and colleagues. When we were doing the search for the next Chair of Psychiatry I had the opportunity to meet with each of the candidates, a large number of whom were Chairs of Psychiatry at other medical centers. To a person they all began the meeting by offering their praise for Alan Schatzberg and by indicating that their interest in Stanford was because such a great department had been built under his leadership. This is wonderful praise that reflects a great legacy.

On behalf of his many friends and colleagues it is a pleasure to thank Alan Schatzberg for nearly two decades as department chair and for developing an incredibly excellent academic Department of Psychiatry at Stanford. We also wish Alan well in all his future endeavors.

Transitions and Searches

The excellence of an Academic Medical Center is defined by the quality of its faculty, students and staff together with the leaders of its mission critical programs in education, research and patient care. Currently there are a number of important searches and transitions underway within the medical center. One of these is the search for the next President and CEO to replace Martha Marsh, who retires on August 31st. I thank her again for her eight years of leadership at SHC and work on behalf of Stanford Medicine. I have also commented in prior newsletters on the work of the search committee that is working actively to find the most outstanding individual possible to succeed Martha (see: http://deansnewsletter.stanford.edu/archive/05_24_10.html#5 for the position description). Because there will be an interval before a new CEO is selected and arrives, Mike Peterson, who served as the interim CEO in 2001 for the year prior to Martha Marsh's arrival in April of 2002, has agreed to serve as interim leader over the months ahead. I hope to provide additional updates in the not too distant future about the progress of the committee.

In addition to the leadership transition at SHC, several search committees are now in progress or will soon begin working to find chairs of four important School of Medicine departments. Two of these are currently or will soon begin interviewing candidates. This first is the search for the next Chair of the Department of Radiology. Over more than two decades Dr. Gary Glazer has built one of the finest academic departments of Radiology in the world. Dr. Bobby Robbins, Professor and Chair of Cardiothoracic Surgery and Director of the Cardiovascular Institute of Medicine, is leading the search for his successor. The second is the search for the next Chair of the Department of Radiation Oncology. Dr. Rich Hoppe, who has also built an excellent department, is stepping down after 15 years of outstanding service. Dr. Bev Mitchell, Professor and Director of the Stanford Cancer Center, is chairing the search committee for his successor.

Two other search committees will begin their work in the weeks ahead. First, Dr. Linda Shortliffe, who has served as chair of the Department of Urology for over 15 years, has announced her intention to step down from her chairperson responsibilities in 2011. Dr. Shortliffe is widely recognized as a leader in American Urology and has recruited a number of highly talented faculty to Stanford and has developed a highly valued training program – for which we are deeply appreciative. Dr. Sherry Wren, Associate Dean for Academic Affairs and Professor of Surgery, will serve as the chair of the Search Committee for the next Chair of Urology.

The fourth position for which we will be seeking a new leader is the Chair of the Department of Medicine. On July 29th, Dr. Ralph Horwitz sent the following communication to the Department of Medicine and the School of Medicine Executive Committee:

Message from Dr. Ralph Horwitz, Chair of the Department of Medicine

As the academic year 2010 draws to a close, I write with the very good news of stellar performance by the Department of Medicine and with plans for my own activities here at Stanford.

By every measure of success, the department has exceeded its own high level of expectation. Our research has continued to expand in both scope and depth. Our traditional excellence in basic and translational research is now complemented by increasing strength in patient/population health sciences. During the past year, we have seen research expenditures in the department increase 18.5 percent from \$82 million in 2009 to a projected total of over \$100 million in 2010. Our clinical volumes also continue to grow as the department emphasizes cutting-edge expertise and complex medical care. And of course, whether for students, residents or fellows, our educational programs are widely acknowledged as a major strength of our department.

Among our most notable accomplishments is the enormous success we have experienced in bringing to Stanford new faculty at all ranks. Many of these appointments are in the patient and population sciences that were previously less developed than the laboratory based sciences. This emphasis on the growth of patient/population sciences within the department now also provides me the chance to extend my commitment to the success of this program through my own scholarship.

With the full support of the Dean Phil Pizzo, I will begin now to focus my energies on research and program development that advances the patient and population sciences here at Stanford. While I will continue my appointment as chair through the end of my term that concludes October 31, 2011, I plan to step aside from my administrative duties at the end of this October. Over the next several months a transition team will be appointed and I will serve as consultant and advisor to them. Effective November 1, I will begin an administrative leave that will enable me to concentrate on my new role and activities. Dean Pizzo will establish a search committee to find my successor.

The quality of faculty, residents, fellows and staff of our department makes us the envy of many peer departments across the country. Contributing to the success of all of you has been the major source of my own satisfaction since coming to Stanford in 2006. I look forward now to working alongside you to ensure that our department remains a standard against which other departments are measured.

In response to the announcement from Dr. Horwitz, on August 6th I sent the following statement to the Department of Medicine and the Medical School Executive Committee.

Message from Phil Pizzo to the Department of Medicine and Executive Committee on
August 6, 2010

In announcing his personal plans to the Department of Medicine last week, Dr. Ralph Horwitz also commented that I would be appointing a Leadership Transition Team to oversee the department as well as a Search Committee for the next chair of the Department of Medicine. I now want to give you some updates.

First, I am very pleased to announce that Dr. Linda Boxer, Professor of Medicine and Chief of the Division of Hematology, will serve as the Chair of the Leadership Transition Team and as Interim Chair of the Department of Medicine. Both of these appointments are effective as of August 1, 2010. In addition to Dr. Boxer, the Leadership Transition Team will also include current Vice Chairs Drs. Andy Hoffman, Larry Leung, Kelly Skeff and Alan Yeung. Each has pledged his commitment and support to assist Dr. Boxer and to do all that he can to help the department in every way possible. As Dr. Horwitz noted in his message, he will serve as an advisor to the Leadership Transition Team until he begins his administrative leave on November 1, 2010. Both Dr. David Stevenson and I are also committed to doing all that we can to help support Dr. Boxer and the Leadership Transition Team.

I am also pleased to announce that Dr. Steve Galli has agreed to serve as the chair of the Search Committee for the next department chair. The Office of Academic Affairs will be contacting committee members and our Office of Institutional Planning will help support the search process.

The Department of Medicine is comprised of exceptional faculty, trainees and staff, and we are committed to doing all we can to continue its trajectory of excellence. I am confident that Dr. Boxer and the Leadership Transition Team will help make this a reality.

Needless to say, taken together these transitions are quite significant for the School of Medicine, the Medical Center and the University. In tandem with these leadership changes are some other major external and internal challenges that will impact us over the next several years. Among these is the impact of the continuing economic downturn both nationally and in California, which has consequences for future philanthropic support as well as state and federally supported programs like MediCal and the future funding for stem cell research. We are also all too aware of the decreased support for biomedical research from the NIH as ARRA (American Recovery and Reinvestment Act) funding comes to an end. Also looming ever larger is the impact of health care reform with the passage of the Patient Protection and Affordable Health Care Act on March 23, 2010. While significant reform of healthcare is essential, one of the necessary consequences will be decreasing amounts of financial payments and major shifts in where and how healthcare is provided. These changes are essential, but they will certainly have important consequences that we will need to anticipate, prepare for and respond to over the next several years.

In light of all these changes, I have also been considering my own role as Dean of the School of Medicine, a position I have been privileged to hold since April 2001. In order to provide continuity through the major institutional programmatic and institutional changes we are facing, I have discussed with the President and Provost my continuing service as Dean for up to three more years. During this time the major leadership changes (and likely others) noted above will have been completed, and we will have developed plans and strategies for responding to – and hopefully leading – the major external and internal challenges that lie ahead.

While not reducing my term to other quantifiable units, I could add that three more years would yield about 68 new Dean's Newsletters - If I add those to the 214 issues of the DNL already on line (<http://deansnewsletter.stanford.edu/archive/>), I find that I still have nearly a quarter of the total yet to come. Of course, I hope that many of these will chronicle the exciting and hopefully transformative events in the continuing evolution of Stanford Medicine over the years ahead. And for your additional reading pleasure you may (or may not) be happy to note that our Office of Communication and Public Affairs has encouraged me to develop a Twitter feed as a complement to, but not a replacement for, the DNL. I hope those of you who are on Twitter find this addition a helpful communication modality to keep up with the latest news and perspectives from the School.

Campaign Update

On October 6, 2006, President John Hennessy launched the \$4.3 billion Stanford Challenge. I am pleased to say that the Medical's School target of \$991,000,000 for the ongoing campaign has been achieved and that crossing the \$1 billion mark is imminent. I want to thank our Office of Medical Development and especially our faculty and staff for making this happen. I particularly want to thank our donors, large and small, who have invested in Stanford Medicine and who are helping us to transform the future.

Henry Kaplan and the Story of Hodgkin's Disease

Dr. Charlotte DeCroes Jacobs, the Ben and A. Jess Shenson Professor of Medicine (Oncology), has written an extraordinarily rich and informative biography of Henry Kaplan, one of the true pioneers of American Science and Medicine of the 20th Century. The story of Dr. Kaplan is not only about one of the most important chapters in cancer biology and medicine, it is also very much the story of Stanford. Dr. Kaplan was one of the most visionary and vigorous leaders of Stanford Medicine as it migrated from San Francisco to Palo Alto and as it sowed the seeds for one of the most successful research-intensive schools of medicine in the world. *Henry Kaplan and the Story of Hodgkin's Disease* has been published in 2010 by the Stanford University Press (<http://www.sup.org/book.cgi?id=16764>). Dr. Jacobs described some of her goals and reasons for writing this important biography in an April 10th interview with Paul Costello (see: <http://med.stanford.edu/ism/2010/april/5q-jacobs-0412.html>).

Advanced Residency Training at Stanford (ARTS) Program

Stanford University residents and fellows interested in combining clinical training with advanced research training are invited to apply to the Advanced Residency Training at Stanford (ARTS) Program. ARTS offers the opportunity to obtain a PhD degree during or upon completion of residency or clinical fellowship. The program begins with approximately 12 – 48 months clinical training, followed by research training in a graduate program in the School of Medicine, Engineering or Humanities and Sciences at Stanford University. Residents and fellows admitted to the program complete clinical training toward board certification in internal medicine, its subspecialties (cardiovascular medicine, hematology, immunology and rheumatology, infectious diseases, nephrology, oncology, pulmonary and critical care medicine), surgical disciplines (neurosurgery, obstetrics and gynecology, surgery, urology), or non-surgical disciplines (neurology,

pathology, pediatrics, psychiatry, radiation oncology, radiology). The Program Director of this Graduate Training Program is **Sanjiv Sam Gambhir, MD, PhD**, and funding is available for tuition, stipend, and health benefits.

The application deadline is **October 4, 2010** (for applicants starting their PhD coursework in Fall, 2011). Please contact the ARTS Program Office for more information at (650) 724-9139 or sofias@stanford.edu.

Web Site:<http://med.stanford.edu/arts/>

Noted Author Dr. Pauline Chen will be the 20th Annual Jonathan King Memorial Lecturer.

On Monday October 11th at 5:30 pm in the Millie and Paul Berg Hall in the Li Ka Shing Center for Learning and Knowledge, Dr. Pauline Chen will deliver the 20th Annual Jonathan King Lecture entitled “*Doctor and Patient: Lost in Translation.*”

Dr. Chen, a liver transplant and liver cancer surgeon, is the author of ***Final Exam: A Surgeon's Reflections on Mortality***, a New York Times bestseller. She graduated from Harvard University and Northwestern University Feinberg School of Medicine, completing her surgical training at Yale University, the National Cancer Institute (NIH), and UCLA, where she was most recently a faculty member in the Department of Surgery. In 1999, she was named UCLA's Outstanding Physician of the Year. She has been nominated for a National Magazine Award, and has written for numerous publications, including the New York Times.

This lectureship was established to honor the memory of Dr. Jonathan King to encourage the compassionate and human care of patients (see: <http://bioethics.stanford.edu/events/king.html>).

Tickets Go on Sale for the Visit of His Holiness the Dalai Lama

I am very pleased to let you know that His Holiness the Dalai Lama will visit Stanford on October 14 and 15 and will participate in three public events on the general theme of Compassion, Science and Society. These include a public talk in Maples Pavilion, a lecture (for Stanford students only) at Memorial Church and an all day conference with scientists and educators in Memorial Auditorium. Tickets for these events are available starting today, August 30. Further information, including how to obtain tickets, is available at <http://dalailama.stanford.edu/>. If past experience is at all predictive, tickets will go quickly.

This visit is being sponsored by the School of Medicine, the Stanford Institute for Neuro-innovation and Translational Neuroscience ([SINTN](#)), the Center for Compassion and Altruism Research and Education ([CCARE](#)), and the Office for Religious Life. The Dalai Lama's interest in the intersection of science and Buddhist practice is well known and was the inspiration for the establishment of CCARE, whose mission is:

- To undertake a rigorous scientific study of the neural, mental and social bases of compassion and altruistic behavior that draws from a wide spectrum of disciplines, especially neuroscience, psychology, economics and contemplative traditions.
- To explore ways in which compassion and altruism can be cultivated within an individual as well as within the society on the basis of testable cognitive and affective training exercises.

No doubt the October visit will help advance these worthy goals.

Awards and Honors

- **Dr. Suzanne Pfeffer**, Professor of Biochemistry, has been elected President of the prestigious American Society for Biochemistry and Molecular Biology (ASBMB). The Society was founded in 1906 “to advance the science of biochemistry and molecular biology through the publication of scientific and educational journals, scientific meetings, advocacy for the support of basic research and education, and diversity of the science workforce.” The ASBMB has over 12,000 members. Dr. Pfeffer’s term runs from 2010-2012.

Dr. Rob Malenka, Pritzker Professor of Psychiatry and Behavioral Sciences, Director of the Nancy Friend Pritzker Laboratory and Co-Director of the Stanford Institute for Neuro-Innovation and Translational Neuroscience, has won two prestigious awards. These are two exceptional recognitions of Dr. Malenka’s outstanding research.

- - The first is the Goldman –Rakic Prize for Outstanding Cognitive Neuroscience Research, which is awarded annually by NARSAD, the Brain and Behavior Research Fund. The award is for “excellence in neurobiological research at the cellular, physiological, or behavioral levels that may lead to a greater understanding of underlying psychiatric or neurological disease.”
 - The second is the Pasarow Award for Extraordinary Accomplishment in Medical Research-Neuropsychiatry. Dr. Malenka will share this award with Roger Nicoll of UCSF and Charles Stevens of the Salk Institute.
- **Dr. Jack Remington**, Professor of Medicine Emeritus, will receive the 2010 Mentor Award from the Infectious Disease Society of America. Dr. Remington has been deeply admired as a mentor by nearly 70 Fellows during his 40-year career at Stanford, whose stories are told in “We Were Fellows,” which was prepared in his honor. This is a great acknowledgement of a much-revered teacher and mentor.
- **Dr. Gary Steinberg**, Professor of Neurosurgery and the Neurosciences and Chairman of the Department Neurosurgery, has received the 2010 Outstanding Achievement in Medicine Award from the Santa Clara County Medical Association (SCCMA). This award is given annually to a physician member of the association who has achieved widespread recognition for their unique contributions to the betterment of patient care.
- **Katalin Szabo**, SMS 6+, is one of 20 students being awarded the American Medical Association (AMA) Foundation Physicians of Tomorrow Scholarship based on her academic performance, financial status and community service. This award includes a \$10,000 scholarship to help defray the expenses of medical education.
- **Dr. Ian Whitmore**, Professor of Surgery (Anatomy), has been awarded the Jubilee Medal by the All-Russian Scientific Society of Anatomists, Histologists and Embryologists – the largest Anatomical Society in the world.

- **Dr. Douglas Owens**, Professor of Medicine and of Health Research and Policy, has been awarded the Society for Medical Decision Making's John M. Eisenberg Award. It will be presented at the Society's annual meeting in Toronto in October.

Congratulations to all!

Appointments and Promotions

Maheen M Adamson has been appointed to Clinical Assistant Professor of Psychiatry & Behavioral Sciences, effective 8/1/10.

Sadick Alsadir has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 7/1/10.

Roland Bammer has been promoted to Associate Professor (Research) of Radiology, effective 8/1/10.

Barbie J. Barrett has been promoted to Clinical Associate Professor of Surgery, effective 9/1/10.

Gulshan Bhatia has been reappointed to Clinical Professor (Affiliated) of Medicine, effective 9/1/09.

Michela Camorcia has been appointed to Clinical Assistant Professor of Anesthesia, effective 11/1/10.

Michael I Chen has been promoted to Clinical Associate Professor of Anesthesia, effective 9/1/10.

Michael Joshua Cisco has been reappointed as Clinical Assistant Professor of Pediatrics, effective 7/1/10.

Edward L. Cohen has been reappointed as Clinical Associate Professor (Affiliated) of Obstetrics and Gynecology, effective 10/1/10.

Edwin Colloff has been reappointed to Clinical Assistant Professor of Medicine, effective 9/1/10.

Bernard Dannenberg has been promoted to Clinical Associate Professor of Surgery, effective 8/1/10.

John Dorman has been reappointed as Clinical Professor of Medicine, effective 9/1/10.

Terry S. Desser has been reappointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 8/1/10.

Peter D'Souza has been promoted to Clinical Assistant Professor of Surgery, effective 9/1/10.

Ian Glen Ferguson has been reappointed to Clinical Assistant Professor of Surgery, effective 9/1/10.

Wendy Flapan has been appointed to Clinical Assistant Professor of Neurosurgery, effective 8/1/10.

Leonard Goldschmidt has been reappointed as Clinical Associate Professor (Affiliated) of Ophthalmology, effective 5/1/10.

Julie J Good has been promoted to Clinical Associate Professor of Anesthesia, effective 9/1/10.

Laura A Gross has been reappointed to Clinical Assistant Professor of Medicine, effective 6/1/10.

Lauren C. Harshman has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 8/1/10.

Paul Hwang has been reappointed to Clinical Assistant Professor of Pediatrics, effective 9/1/10.

Michelle Inserra has been appointed as Clinical Assistant Professor (Affiliated) of Otolaryngology/Head & Neck Surgery, effective 8/1/10.

Saraswati Kache has been promoted to Clinical Associate Professor of Pediatrics, effective 8/1/10.

Laurence Katznelson has been promoted to Professor of Neurosurgery and of Medicine at the Stanford University Medical Center, the Lucile Salter Packard Children's Hospital, and the Veterans Affairs Palo Alto Health Care System, effective 8/1/10.

Shannon Kilgore has been promoted to Clinical Assistant Professor of Neurology & Neurological Sciences, effective 9/1/10.

Larisa Kunda has been appointed as Clinical Assistant Professor (Affiliated) of Otolaryngology/Head & Neck Surgery, effective 8/1/10.

Pamela L. Kunz has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 8/1/10.

David P. Lee has been promoted to Associate Professor of Medicine at the Stanford University Medical Center, effective 8/1/10.

Grant Lipman has been reappointed as Clinical Assistant Professor of Surgery, effective 9/1/10.

Bingwei Lu has been promoted to Associate Professor of Pathology, effective 8/1/10.

Hari R. Mallidi has been appointed to Assistant Professor of Cardiothoracic Surgery at the Stanford University Medical Center, effective 8/1/10.

Michael R. Manuel has been promoted to Clinical Assistant Professor of Obstetrics and Gynecology, effective 9/1/10.

Stephen McKenna has been promoted to Clinical Assistant Professor (Affiliated) of Medicine and of Neurosurgery, effective 6/1/10.

Lynn Million has been promoted to Clinical Associate Professor of Radiation Oncology, effective 9/1/10.

Subir Nag has been appointed to Clinical Professor (Affiliated) of Radiation Oncology, effective 6/1/10.

Viet Nguyen has been appointed to Clinical Assistant Professor of Neurology & Neurological Sciences, effective 8/1/10.

Douglas Ota has been appointed as Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 6/1/10.

Anna E Plauth has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 6/1/10.

Vandana Punj has been promoted to Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 6/1/10.

Kavitha J Ramchandran has been appointed to Clinical Assistant Professor of Medicine, effective 8/1/10.

V. Mohan Reddy has been appointed to Professor of Cardiothoracic Surgery at the Stanford University Medical Center and of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 8/1/10.

Lisa Schmelzel has been reappointed to Clinical Assistant Professor of Radiology, effective 8/1/10.

Run Zhang Shi has been promoted to Clinical Assistant Professor of Pathology, effective 8/16/10.

Upinder Singh has been promoted to Associate Professor of Medicine and of Microbiology and Immunology, effective 8/1/10.

Dharshi Sivakumar has been reappointed to Clinical Assistant Professor of Pediatrics, effective 4/1/10.

Sakti Srivastava has been appointed to Associate Professor (Teaching) of Surgery, effective 8/1/10.

Kristan Staudenmayer has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 8/1/10.

Daniel Y. Sze has been promoted to Professor of Radiology at the Stanford University Medical Center, effective 8/1/10.

Melinda L. Telli has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 8/1/10.

Vance Vanier has been promoted to Clinical Assistant Professor of Surgery, effective 9/1/10.

Robert Wallerstein has been appointed to Clinical Associate Professor of Pediatrics, effective 7/1/10.

Robert West has been promoted to Associate Professor of Pathology at the Veterans Affairs Palo Alto Health Care System and at the Stanford University Medical Center, effective 8/1/10.

Joseph Wu has been appointed to Associate Professor of Medicine and of Radiology, effective 9/1/10.

Julie Yabu has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 8/1/10.

David C Yao has been promoted to Clinical Associate Professor of Medicine, effective 5/1/10.

Victor Kenneth Zafren has been promoted to Clinical Associate Professor of Surgery, effective 9/1/10.

Dean's Newsletter September 13, 2010

Thinking About Transforming Medical Education – Again

In the August 30, 2010 issue of the Dean's Newsletter (<http://deansnewsletter.stanford.edu/#2>), I commented briefly that our efforts to transform medical education entered a more formal planning process with a Think Tank on August 28th. Over 40 faculty, students, staff and guests participated in a thoughtful and provocative discussion of what has changed since we introduced

our “New Stanford Curriculum” in 2003 and, even more importantly, how we might construct medical education if we had the opportunity to make a truly fresh and bold new start. I hasten to add that the August 28th Think Tank on Medical Education is one of three such events we are holding this summer and fall. We began with a Think Tank on Postdoctoral Education and Training (see: http://deansnewsletter.stanford.edu/archive/07_26_10.html#2) and will hold a separate Think Tank on Graduate Student Education on October 9th. These three planning activities are interconnected, and it is my intent to bring them together for interactive review and discussion at our Strategic Planning Leadership Retreat in January 2011. Prior to that we will develop more deeply the ideas and recommendations emerging from each of the Think Tanks with the goal of having action plans and implementation timelines constructed over the next six months.

The good news is that many academic medical centers are thinking about medical education and drawing linkages between undergraduate and graduate training. With the centennial anniversary of the Flexner Report, which set the stage for the education models that still exist in many programs, it is clearly time to think about the future. But this statement needs context. The education and training of physicians has changed enormously over the past many decades, and defining the physician of the future will be shaped by the enormous changes unfolding in science as well as society. Indeed, over the past decades Stanford has configured unique medical education training programs that have embraced the culture of the University and the mission of the School.

When the medical school moved to the Stanford Campus in 1959, the curriculum was structured as the Five Year Plan. Over the decades this Plan evolved from being flexible to being close to disorganized. Nevertheless, it still persists in some of its core principles today. A major reorganization and re-conceptualization resulted in the introduction of the New Stanford Curriculum (see: <http://med.stanford.edu/md/>) in the Fall of 2003. To set the stage for the changes we may contemplate, it may be helpful to remind you about the principles and programs that guide our current curriculum. Specifically, the 2010 Stanford MD curriculum integrates basic science and clinical experience with in-depth study and independent research throughout the years of medical school (see: <http://med.stanford.edu/md/curriculum/>). Other major themes of the new curriculum include:

- **Integration**
 - Streamlined content and optimized course sequence
 - Melding of basic science and clinical concepts throughout the curriculum
- **Individual Opportunities**
 - Blocks of unscheduled time for individual or group study, elective coursework, and research
 - Option of a fifth or sixth year of study and opportunities for earning joint degrees
- **Scholarly Concentrations**
 - Area of academic focus, or "major," designed to ground the student's education in an area of passionate interest
 - Enhance student satisfaction with the study of medicine and foster a lifelong commitment to investigation and cross-disciplinary thinking
- **Strengthening of doctor-patient communication and clinical skills instruction**

- Broad clinical science education in the first two years with early exposure to patient care and the practice of medicine
- Early entry into clinical clerkships
- Broader emphasis on doctor-patient communication, ethics, and the art of medicine
- **Educators-4-CARE (E4C)**
 - The Educators-4-CARE (E4C) Program was established to enhance the development of medical students as skilled and compassionate physicians. E4C provides a formal curriculum aimed to foster the development of some of our core values – Compassion, Advocacy, Responsibility, and Empathy – from the beginning and throughout medical school.
 - Beginning in 2008, each incoming medical student has been matched with one of our Educator-4-CARE faculty, who serves as a teacher, mentor, and colleague for the duration of the student's time in our School of Medicine. Each Educator-4-CARE teaches and guides 5-6 students per class year in the following ways:
 - During the pre-clerkship years, precept students once per week in the *Practice of Medicine* (POM) course, cultivating students' acquisition and refinement of patient communication skills, physical diagnosis, clinical reasoning, and professionalism
 - During the clerkship years, continue to provide guidance for students' bedside clinical skills and professionalism through semi-monthly "Doctoring with Care" sessions in concert with the *Translating Discoveries* curriculum
 - Write letters of reference as requested
 - Collaborate with other E4C faculty, POM course directors, and Advising Deans to assist in students' academic and professional development
 - Participate in student milestone events and celebratory gatherings

Basic and clinical sciences and scholarly work are woven together throughout all years of medical education. The barriers among these disciplines are broken down by mixing elements of

investigation, basic science, and clinical practice within the scholarly concentrations.

Building on the changes that have been made since 2003, a number of important themes were considered at the August 30th Think Tank that will shape our future directions. These include:

- The prospect of taking dramatic new steps in furthering the integration between basic and clinical science at the individual patient as well as broader societal and global levels. A common experience for virtually everyone who has gone to medical school is that knowledge sticks best when it is configured around the patient narrative. For nearly all, case-based learning is the optimal way to integrate basic and clinical science, but currently this happens in a fragmented manner over years of time. While there is core knowledge that every physician must possess, the reality is that much of this knowledge will evolve and change over time and will require constant renewal and the skills (and the will) for lifetime learning. Speaking personally, my own medical and scientific knowledge continues to change dramatically, now four decades since I graduated from medical school. And the pace of these changes is likely to accelerate in the years and decades ahead.
- A model we have been exploring is whether learning teams can be constructed of groups of students and a teacher-coach in which each team spends a block of time with one patient problem/disease and studies every aspect of that condition across the entire “health care value chain” – molecular, physiological, pharmacological, health care system, social, economic, cultural. These teams can change over time but might also be configured to emphasize different career tracks or learning pathways – with flexibility but also the prospect for concentration and research as part of the learning experience.
- The length of time of medical education is simply too long, and one of the opportunities worth exploring is how to better integrate education from high school and college through undergraduate, graduate and post-graduate training. Creating a horizontally and vertically integrated learning pathway could be uniquely accomplished at Stanford and has the prospect for better integrating basic and clinical science, reducing redundancy and shortening the overall education and training period. Of course this would require cooperation among the Schools of Humanities & Sciences, Engineering and Medicine – but based on the discussion at our Think Tank and the input from Deans Saller (H&S) and Plummer (Engineering) the prospects for doing this are feasible and opportune.
- It was also clearly recognized that the world of medicine as we know it will be changing dramatically in the years ahead. As knowledge emerges from fields like genetics and genomics, the prospects for individualizing patient risk, early diagnosis, care and prevention will change in ways that can only barely be predicted. Innovations in health and disease management will need to take center stage, and outcomes based on evidence and underpinned by quality, safety and service will further define medicine of the 21st century. Education will need to be anchored not just in the traditional hospital setting but also increasingly in ambulatory and community programs – regionally and globally. While doctors will continue to play a central role, they will also need to be part of the healthcare team and system. Other providers will play increasingly important roles and team based education will become important – something that we are well poised to do in

our Immersive Learning Center in the new Li Ka Shing Center for Learning and Knowledge.

- Because Stanford offers unique opportunities for interdisciplinary learning and research, we want to continue to foster the opportunities for joint programs with other Stanford Schools that have been developed over the past several years. We also want to continue to select students who have the opportunities to develop transformative career paths in their own right – but who also can lead change at local, regional, national and global levels.

These are just some of the issues and themes that emerged at the August 30th Think Tank. We will continue to refine the ideas that have been put forward and to establish Work Groups to further develop and refine them over the next several months. In my opinion, we are building on excellence and have an opportunity to take our education programs to a new level. We have no choice but to move to greater excellence while respecting our past, staying true to our mission but ready to shape the future.

Letter to the Nation's New Medical Students

This week we were asked by Department of Health and Human Services Secretary Kathleen Sebelius and National Coordinator for Health Information Technology David Blumenthal, MD to distribute the letter that follows to first year medical students. This letter is adapted from Dr. Blumenthal's commencement address to the University of Florida College of Medicine 2010 graduating class. I felt the content of the letter merited sharing it with our entire community.

An Open Letter to New Medical Students

Congratulations on entering the profession of medicine. Many of you and your families have sacrificed enormously to get to this moment. We understand the tide of emotions you and your families are experiencing: pride, relief, gratitude, anticipation – and perhaps a little anxiety. After all, most of you will now begin the rigors of medical school and residency, from which you will emerge as fully trained physicians, but only after another long and demanding next phase in your professional life.

You are entering one of the most admired and privileged professions known to man, and with that honor comes great responsibility. You will be the bearers of hope: the hope of every parent for the recovery of a sick child, of every spouse for the healing of a suffering partner, of every son and daughter for the longevity of an aging parent.

We are struck by the fact that you are the first class of medical students to start since Congress passed and President Obama signed into law the Affordable Care Act of 2010, also known to some as the health reform law.

We believe deeply that the Affordable Care Act will be good for you and for your patients, and for the health system overall. We hope each of you can and will play a vital role in ensuring the vision of reform becomes the reality of high-quality, high-value health care for your patients, your families, and your neighbors.

It starts with making sure each of you understands what is in the new law so you can communicate both what it means in terms of the health care coverage options your patients may be eligible for, and how it gives both patients and doctors more control over their health care decisions. The best place to start this education process is our new consumer web site – HealthCare.gov. This new tool, which has been widely praised as being straightforward and easy to use, not only will help patients find health care coverage options, but will also give them detailed information about what will happen when, as well as some important tips for healthy living.

While the implementation of this major new law will unfold over years, many positive provisions are already taking effect. Many of you and your siblings are undoubtedly under the age of 26. Before the enactment of the Affordable Care Act, health plans decided when dependent child coverage would end, and, in many cases, such coverage would end the moment you left college unless you went on to graduate school.

Without college coverage, your families or the families of your friends have had to find individual insurance plans in the private market – plans whose premiums are unaffordable to many Americans – or pass up health insurance altogether, which many have unfortunately done. The result: 3 in 10 young adults are currently uninsured in the U.S. Under the Affordable Care Act, you and your brothers or sisters will now be able to stay on your families' insurance policies until you are 26. While this part of the law is scheduled to go into effect for plan years beginning on or after September 23, 2010, more than 65 insurance companies, including the nation's largest, have already voluntarily extended coverage to age 26.

Of course, the problem of insurance companies denying coverage to patients who need it most goes beyond young people. Practitioners of adult medicine have routinely faced the same thing: patients with heart disease, cancer, multiple sclerosis, diabetes, or lupus losing their coverage; or running up against annual and lifetime dollar limits; or getting frozen into a job because, if they changed where they work, they could no longer get insurance that covered their pre-existing conditions.

That led to tough choices for them and their doctors, too: how to space out or prune away appointments and tests and treatments to minimize costs – how to decide which necessary medicines were *really* most essential. Sometimes, these patients just disappeared from care without explanation, ashamed to admit they could no longer pay their bills.

As a result of the Affordable Care Act, those of you treating adults will no longer face these tough, troubling choices during your careers. Starting in 2014, around the time when you begin your residencies, insurance companies will have to sell coverage to all Americans, regardless of their health status.

That means absolutely no one can be turned away. Insurance companies won't be able to place annual or lifetime limits on coverage, or take it away when patients get sick. Your patients' lives will be better off as a result, and you will have a new level of clinical autonomy that preceding generations of physicians never enjoyed: the ability to do what is right and best for your sickest, most vulnerable patients who are not eligible for government programs like Medicare and Medicaid.

These are just a few of the Affordable Care Act's benefits that are already being realized. But we also want to tell you about some other critical reforms to our health care system that have taken effect recently, and where we especially need your help to get the message out. One really significant way that we can reform the way we practice medicine is through the adoption and meaningful use of electronic health records.

Every doctor knows that she is only as good as the information she has about her patients. Information is the lifeblood of medicine. Without clinical data – progress notes, laboratory data, images, microbiology reports – we're reduced to guesswork.

Yet, the United States today lives with a health information system that relies on the same technology – pen and paper – that Hippocrates used 2400 years ago. Every aspect of your lives is computerized, from laptops to cell phones to pagers. You're connected 24/7. Yet, most doctors go to work and pick up a pen or pencil to record the most precious resource of their trade – data about their patients' health problems.

Can you imagine caring for patients 20 years from now without computers, without electronic health records, without the ability to send patient information electronically from your office to the hospital, from one hospital to another, from the hospital to your office? It would be like practicing medicine with one hand tied behind your back.

The President and Congress have authorized a huge amount of resources – literally billions of dollars – toward implementation of electronic health records for the entire nation through the HITECH Act. This is a new federal initiative dedicated to creating a modern, 21st-century electronic health information system for the nation's clinicians and their patients.

The Department of Health and Human Services has been granted important new authorities to help create a private and secure nationwide interoperable electronic health information system. Our ability to make change pales in comparison with the power of your generation to transform medicine by insisting, by *demanding*, that wherever you end up practicing, you have a modern electronic health information system at your disposal to help you be the best physicians you can be. We in the federal government will do our best to support you.

When you finish medical school, send the hospitals and residencies that are recruiting you a clear message. It is past time for them to enter the electronic age. It is past time for them to give you the information tools you need to do your jobs. You will change the face of medicine forever and for the better.

Every generation should be better off than the last. Well, we think the stars are aligned for you now. As you start your careers, medicine retains its age-old ability to apply the balm of hope, while scientific progress continually increases your ability to turn that hope into the reality of disease avoided or cured, of life prolonged, of suffering relieved.

And you and your patients will benefit from a new era in which the compassionate impulses of the American public have been translated into a commitment that all your patients will have access to the best care this country has to offer. Now, as pioneers of a revolutionary transition in the delivery of care, you have the responsibility to ensure that your successors have the same advantages – and more – that you will have. Good luck with that challenge, and congratulations.

Kathleen Sebelius and David Blumenthal, MD

The Potential Impact of Healthcare Reform Legislation on Graduate Medical Education

I have discussed previously the potential impact of healthcare reform on graduate medical education (GME), which has been largely funded by Medicare (except for pediatric GME, which is covered not by Medicare but by the Children's Hospitals Graduate Medical Education Payment Program). Given the passage of the Patient Protection and Affordable Care Act and the likely changes that will impact healthcare costs in general and Medicare in particular, the potential impact on GME is of interest and concern to every academic medical center. This important topic was recently addressed by John K. Iglehart in a Health Policy Report in the July 21st issue of the New England Journal of Medicine (see:

<http://healthpolicyandreform.nejm.org/?p=3770>) and has been a topic for consideration by virtually every professional group. One of these, the Association of Academic Health Centers (for disclosure, I serve as the chair of the Board of Directors), recently issued a perspective on GME that highlights some of the ideas likely to receive attention over the next years. Each has supporters and detractors, and it remains uncertain as to whether one or more will gain traction. But change in GME as we now know it seems inevitable. In broad terms the dominant themes will include advocacy for one or more of the following:

- ***Broadening the pool of contributors to fund GME beyond that provided by Medicare and Medicaid.*** In the past this has been referred to as the “all payer pool” and, while there has been support from some constituencies, it is likely that the decreasing flow of dollars to healthcare payers and providers will make this a major debate.
- ***Making the funding “follow the student/trainee.”*** This would also give rise to a lot of challenges. Currently DME and IME payments are made to teaching hospitals rather than training programs. While the impact on the financial status of teaching hospitals would be significant, reforms are needed if training is to become more ambulatory than hospital based. Clearly this would also call into focus the balance between service and education as part of GME.
- ***Expanding and reallocating the currently capped number of residency slots.*** This is a major issue that impacts specialty as well as primary care training as well as the economics of academic medical centers.
- ***Expanding GME support to a broader community of health professionals.*** Obviously this has its primary advocacy from non-MD groups and as team based care continues to emerge this focus may gain further traction.

While it is unclear how and when changes in GME will unfold, the next years will surely be witness to one or more changes. This is another important issue to prepare for as healthcare reform evolves.

Defining and Committing to Patient-Centric Standards of Care

In my December 1, 2008 Dean's Newsletter I addressed the important issue of Professionalism and Patient-Centricity (see: http://deansnewsletter.stanford.edu/archive/12_01_08.html). Over the past months some progress in improving the patient experience has taken place, as I highlighted in the July 26, 2010 Newsletter (see: http://deansnewsletter.stanford.edu/archive/07_26_10.html#7), which included a letter to medical staff from Drs. Ann Weinacker and Bryan Bohman. Expectations for what I might call "minimum" standards for patient-centric care were discussed with the Council of Clinical Chairs meeting on September 10th. These standards have been developed by the Clinical Advisory Council and will be presented to faculty and medical staff by department chairs and service chiefs with the expectation that they will become normative behavior. From my perspective these "standards" are quite basic, and I thought it would be helpful to share them directly as a prelude to the discussions that should take place at division and department meetings. They include physician standards for ambulatory and inpatient settings. I hasten to add that comparable or complementary standards will apply to all staff involved in patient care.

Outpatient Physician Patient-Centric Standards:

1. Physician leader and Clinic Manager should review/reassess clinic schedules at least every quarter.
2. Arrangements for leave of absence coverage must be communicated to clinic managers.
3. Clinic appointments should not be cancelled within 30 days of appointment.
4. Mechanism(s) should be available for urgent/same day visits.
5. Physicians should be in the clinic when the patient is ready.
6. If you have patient care responsibilities you must be available by page or cell phone.
7. Inbox requests should be answered within two business days when "on duty."
8. Referring physicians should receive a written letter/report within one week.

Inpatient Physician Patient-Centric Standards

1. Attending of record (or covering Attending) completes daily rounds on hospitalized patients.
2. Attending of record (or covering Attending) should be immediately available by pager or cell phone during business hours or clearly assign coverage.
3. Inpatient consults should be seen within 24 hours, documented appropriately and discussed with the Attending, as necessary. Urgent consults should be seen within a clinically appropriate timeframe.
4. Recommendations by consults should be communicated in Epic as soon as possible and by phone whenever the clinical situation dictates.
5. Consultants should avoid sending mixed messages to patients by communicating with the primary team before outlining a recommended plan of care to the patient.
6. Patients should be discharged in a timely manner (specific time standards to be determined). Discharge planning and paperwork should be started in advance to allow this to occur.
7. Attending presence for procedure standards (time standards to be determined).

It was noted that patient-specific standards for the Operating Room, Clinical Laboratory and Radiology are forthcoming. I am sure that physician readers of this list will view these standards as pretty self-evident. That said, the data available suggests that they are not routinely employed

– something that clearly needs to change if we are to improve the patient experience. Indeed, in the new world of healthcare it is essential that we do so.

Updates on New Facilities: The Consequences of Moving in While Work is Still Ongoing

If you have been walking along Discovery Walk or Foundation Way to the Li Ka Shing Center for Learning and Knowledge (LKSC) or the Lorry Lokey Stem Cell Research Building (aka Stanford Institutes of Medicine 1) you will have noted continued changes along the way. And if you have been in the LKSC you will surely have noted that lots of things are still being “completed.” I am happy to say that all of the ongoing work will be done by the time of the Grand Opening of the LKSC on September 29th. But until then it will be apparent that this is still a “work-in-progress.” There are advantages and disadvantages of “opening” a facility before it is fully completed. We knew that there would be ongoing disruptions and challenges, but we also recognized that “living in and using” the LKSC would be a great way to work out all the challenges associated with a brand new facility. Over the next two weeks the flooring on the entry level will be finished and the new Café will open. Internal and external signage will be completed as well. And importantly, some of the difficulties with the AV systems, especially in the Millie and Paul Berg Hall, will be rectified (some just became apparent when the first Department of Medicine Grand Rounds was held there this past week). Overall, the LKSC is functioning magnificently, and it truly provides a new face and an incredible resource for the medical school and university.

Faculty will start moving into the Lorry Lokey Stem Cell Research Building in late September. In addition to working in new labs I am sure they (and everyone else) will be amazed by the incredible Dale Chihuly glass sculpture that is filling the atrium and that will provide an incredible glow both day and night. This artwork was gifted to Stanford by My Blue Dots, a nonprofit organization founded by Sue McCollum, with the purpose of combining art with science to create healing, hope and health. Careful observers may have noticed lots of windows being changed in the past weeks. In fact a cosmetic defect was found in a number of glass panels after they had been installed; this discovery led to the decision to change more than 300 glass panes (by the manufacturer of course). The Grand Opening is scheduled for October 27th.

Clearly these are our current “major” projects. That said, there are an incredible number of projects being coordinated by our Facilities Group. These include the planning and move-out from 701 and 703 Welch Road, a large number of smaller renovations throughout the medical school campus, important sustainability and retrofit projects from Beckman and the MSLS buildings, and planning for Fairchild Science as well as the new Friedenrich Center for Translational Research, which will be located on Welch Road. In addition, there is very active planning to meet current and future vivarium needs along with major efforts regarding our current off-site facilities and options both to consolidate them and to create new opportunities. And despite the impact of the financial downturn, we are still planning for the eventual construction of Foundations in Medicine 1 as well as Stanford Institutes of Medicine 2. In other words, there is lots going on – both in what you see and what you may not be aware of. As always, exciting times lie ahead.

Thanks to Drs. Al Lane and Karla Kirkegaard for their Leadership as Department Chairs

I want to once again offer my deep appreciation and gratitude for the outstanding leadership of two of our department chairs. Dr. Al Lane retired as Chair of the Department of Dermatology after 15 years of remarkable service. During his tenure he built on the contributions of prior leaders in dermatology Drs. Gene Bauer and Gene Farber, and helped make the current department one of the jewels of Stanford as well as the nation. In addition to his attention to faculty, resident and student development, Dr. Lane led by example with great personal integrity and excellence. We are all indebted to his many efforts.

Dr. Karla Kirkegaard has completed her 5-year term as Chair of the Department of Microbiology and Immunology, where she has contributed significantly to the department, medical school and university. During her tenure the department completed a number of important faculty recruitments and promoted the excellence of graduate students and trainees. Dr. Kirkegaard also forged important interactions with the Institute for Immunity, Transplantation and Infection as well as with a number of clinical departments and faculty. We are grateful for her many insights and contributions. In the tradition of rotating five-year terms for most basic science faculty, Dr. Kirkegaard will be succeeded as Department Chair by Dr. Peter Sarnow. As I thank Karla I also welcome Peter to this important role.

Birthday Celebration for Dr. Hugh McDevitt

A Celebration of Achievement was held on September 11th in honor of Dr. Hugh McDevitt's 80th birthday. A symposium featuring outstanding leaders in immunology from the USA and Europe focused on the field of "MHC and Disease," which Dr. McDevitt helped create during his incredible career as a physician-scientist at Stanford. We offer our commendation for all that Dr. McDevitt has achieved during his illustrious career and also wish him a very happy birthday.

Awards and Honors

- On September 9th a reception was held to celebrate the appointment of two new holders of endowed professorships:
 - ***Dr. Michael Snyder*** as the Stanford W. Asherman, MD Professor of Genetics
 - ***Dr. Tobias Meyer*** as the Mrs. George A Winzer Professor of Cell Biology
- ***Dr. Michele Barry***, Professor of Medicine and Senior Associate Dean for Global Health, is the recipient of the 2010 Ben Kean Medal, awarded by the American Society of Tropical Medicine and Hygiene to a clinician or educator whose dedication to clinical tropical medicine and impact on the training of students, fellows and/or practitioners of tropical medicine is in keeping with the tradition established by Dr. Kean. The medal is awarded every third year.
- ***Rebecca Rakow-Penner***, MD/PhD candidate in biophysics and graduate student in the Radiological Sciences Laboratory has been honored with the 2010 Norman Blank Award

for the outstanding medical student in radiology. The award was created in memory of longtime faculty member and Director of Admissions Norman Blank, MD.

- ***Dr. Shreyas Vasanawala***, assistant professor of radiology, received the GE Healthcare 2010 Thought Leader Award for innovation in pediatric MRI at the Annual Meeting of the International Society for Magnetic Resonance in Medicine (ISMRM) in Stockholm, Sweden on May 7th, 2010.
- ***Dr. Grant Miller***, Stanford Health Policy core faculty member, has been awarded the "Inter-American Award for Research on Social Security 2010" by the Conferencia Interamericana de Seguridad Social Centro Interamericano de Estudios de Seguridad Social, along with his co-authors Diana Pinto (Javeriana University) and Marcos Vera-Hernandez (University College London).

Dean's Fellows

The following 34 postdoctoral scholars were selected as Dean's Fellows starting this past July. Each will receive \$21,500 in stipend for the coming year to work on proposed research projects with a faculty mentor.

Dr. Robert Ahrends, Chemical and Systems Biology, working with Tobias Meyer, PhD

- http://med.stanford.edu/profiles/postdocs/researcher/Robert_Ahrends/

Dr. Manuel Castellano-Munoz, Otolaryngology, Head & Neck Surgery, working with Anthony Ricci, PhD -http://med.stanford.edu/profiles/postdocs/researcher/Manuel_Castellano%20Munoz/

Dr. Raymond Chen, Biochemistry, working with Patrick Brown, MD, PhD

- http://med.stanford.edu/profiles/postdocs/researcher/Raymond_Chen/

Dr. Tzu-Chun Chen, Microbiology and Immunology, working with Peter Sarnow, PhD

- http://med.stanford.edu/profiles/postdocs/researcher/Tzu%20Chun_Chen/

Dr. Pak-Yan Cheung, Biochemistry, working with Suzanne Pfeffer, PhD

- http://med.stanford.edu/profiles/postdocs/researcher/Pak%20Yan_Cheung/

Dr. Eileen Clancy, Microbiology and Immunology, working with Karla Kirkegaard, PhD

- http://med.stanford.edu/profiles/postdocs/researcher/Eileen_Clancy/

Dr. Emilee Connors, Molecular and Cellular Physiology, working with Richard Lewis, PhD

- http://med.stanford.edu/profiles/postdocs/researcher/Emilee_Connors/

Dr. Pascal Courville, Neurology and Neurological Sciences, working with Richard Reimer, MD

- http://med.stanford.edu/profiles/postdocs/researcher/Pascal_Courville/

Dr. Maria Jose da Silva Texeira Costa, Endocrinology - Pediatrics, working with Brian Feldman, MD, PhD -

http://med.stanford.edu/profiles/postdocs/researcher/Maria%20Jose_Da%20Silva%20Teixeira%20Costa/

Dr. Brett Foster, Neurology and Neurological Sciences, working with Josef Parvizi, MD, PhD

- http://med.stanford.edu/profiles/postdocs/researcher/Brett_Foster/

Dr. Brian Grone, Psychiatry & Behavioral Sciences, working with Emmanuel Mignot, MD, PhD - http://med.stanford.edu/profiles/postdocs/researcher/Brian_Grone/

Dr. Anett Gyurak, Psychiatry & Behavioral Science, working with Amit Etkin, MD, PhD

- http://med.stanford.edu/profiles/postdocs/researcher/Anett_Gyurak/

Dr. Katja Herges, Neurology and Neurological Sciences, working with Lawrence Steinman, MD
 - http://med.stanford.edu/profiles/postdocs/researcher/Katja_Herges/

Dr. Hugo Hilton, Structural Biology, working with Peter Parham, PhD
 - http://med.stanford.edu/profiles/postdocs/researcher/Hugo%20Godfrey%20Harness_Hilton/

Dr. Kai Kohlhoff, Bioengineering, working with Russ Altman, MD, PhD
 - http://med.stanford.edu/profiles/postdocs/researcher/Kai_Kohlhoff/

Dr. David Martinelli, Neurosciences Institute, working with Thomas Sudhof
 - http://med.stanford.edu/profiles/postdocs/researcher/David_Martinelli/

Dr. Gonzalo Olivares, Developmental Biology, working with Margaret Fuller, PhD
 - http://med.stanford.edu/profiles/postdocs/researcher/Gonzalo_Olivares/

Dr. Ying Pan, Urology, working with Joseph Liao, MD
 - http://med.stanford.edu/profiles/postdocs/researcher/Ying_Pan/

Dr. Guillem Pratx, Radiation Physics, working with Lei Xing, PhD

Congratulations to all!

The Dean's Newsletter: September 27, 2010

COME TO THE DEDICATION OF THE LI KA SHING CENTER FOR LEARNING AND KNOWLEDGE ON SEPTEMBER 29TH

Wednesday, September 29th will be a historic day in the history of the School of Medicine. At 10 am the official dedication of the Li Ka Shing Center for Learning and Knowledge will be held on the Alumni Green (next to the Clark Center and in front of the Fairchild Science Building) and at the Li Ka Shing Center for Learning and Knowledge (bordered by Foundation and Discovery Walks). The dedication ceremony will be led by President John Hennessy and Board of Trustees' Chair Leslie Hume. In addition to officially opening the Li Ka Shing Center for Learning and Knowledge, the event will honor Mr. Li Ka Shing who will be present for the dedication. I hope you will participate in this festive event and also take the opportunity to visit the Li Ka Shing Center for Learning and Knowledge during its Open House reception from 11:00 am – 12:30 pm. I hope to see you at the dedication. This is truly a once in a lifetime event! If you wish to attend, please respond to drealaz@stanford.edu no later than 5 pm on Tuesday, September 28th.

Welcome to the 2010 Graduate Students

This past week we welcomed 109 students joining one of Stanford's 13 bioscience PhD programs. This outstanding group of students was selected from over 1550 applicants and includes individuals ranging in age from 17-41 (average is 24 years). Students enter programs that are large (e.g., Biology has 26 new matriculates) as well as small (Molecular & Cellular Physiology and Structural Biology each have one new student). Nineteen of the 109 are international students and, overall, students represent 18 different countries of birth. Women constitute 56% of the incoming class, and 15.9% are underrepresented minorities. Students received their undergraduate degrees from 66 colleges and universities, with Brown, MIT, Rutgers and Stanford topping the list for the number of graduates joining our PhD programs. Not included in this list are the 23 students entering the joint School(s) of Engineering and Medicine Bioengineering program. They come from 388 applicants, ten of whom are international. Their average age is 23, and 23% are women.

This year also brought a new welcoming event for our incoming PhD students -- the "White Lab Coat Ceremony" that was held on Friday evening September 24th. As I described in my August 30th Newsletter (see: http://deansnewsletter.stanford.edu/archive/08_30_10.html#1) the "Stethoscope Ceremony" has become a tradition in welcoming new MD students to the profession of medicine. This year our Stanford Medical Center Alumni Association had the vision to suggest a parallel ceremony for incoming PhD students, and I hope that the "White Lab Coat Ceremmony" will become just as much of a tradition as the Stethoscope Ceremony.

Clinical and Translational Science at the Stanford University School of Medicine

When we launched the School of Medicine Strategic Plan nearly a decade ago we established it under the umbrella of Translating Discoveries (see: <http://medstrategicplan.stanford.edu/>). Based on that foundation we determined that our goal was "*To be a premier research-intensive medical school that improves health through leadership and collaborative discoveries and innovation in patient care, education and research.*" Since then we have made considerable progress in fulfilling a number of the Plan's core objectives in our interrelated missions of education, research and patient care. An important component has been putting into place the programmatic support and infrastructure to facilitate and enhance clinical and translational research. These include our NCI-designated Cancer Center, which is under the leadership of Dr. Bev Mitchell, Professor of Medicine, and our NIH Clinical and Translational Science Award (CTSA), led by Dr. Harry Greenberg, Professor of Medicine and Senior Associate Dean for Research.

At the September 17th Executive Committee Dr. Greenberg gave an update on the Stanford CTSA, one of 55 funded centers nationally (the goal of the NIH is to expand this number to 60 by 2012 as part of a national consortium). The Stanford CTSA is now in its third year of a five-year funding cycle. While the initial budget proposal to the NIH was for \$54 million, cutbacks in program support resulted in an overall NIH five-year award of \$29.6 million. In order to help the CTSA reach its potential, the School has committed up to \$17.5 million over the five years so that most of the critical programs can go forward. As you may recall, the Stanford Center has a unique organizational structure for the School in that it functions as an independent university center, reporting the Vice Provost and Dean of Research (Dr. Ann Arvin). In this role it supports 12 programs across the university, including one that reaches beyond the university and focuses on community engagement. The Stanford CTSA is called ***Spectrum*** (see <http://spectrum.stanford.edu/>). It is overseen by an External Advisory Board, as well as by a Strategic Advisory Board, which I chair.

Since its inception, Spectrum has had three major objectives:

1. ***Innovation:*** to develop programs that stimulate innovation in devices, drugs and comparative effectiveness and healthcare delivery research. Some of this is nucleated by pilot project funding.
2. ***Education:*** to develop programs that foster knowledge and expertise in clinical and translational research beginning with high school students and extending all the way to faculty
3. ***Implementation:*** to simplify, organize and make more accessible the key support services and resources needed to stimulate clinical and translational research -- and to measure and assess their outcomes.

During his Executive Committee report Dr. Greenberg detailed some of the accomplishments that have been achieved in various program areas. I will highlight a few of these as examples:

Study Design and Biostatistics (Dr. Phil Lavori is the Program Leader): Since 2008 there have been over 830 free consults by the Biostatistics Consultation Service. Over 30 major projects have been reviewed and a number of workshops have been conducted, including one that focuses on "difficult statistical challenges." In addition, this program has fostered yearly "intensive courses in clinical research," which have provided sophisticated and in-depth training on clinical trial design and methodology to approximately 125 trainees and faculty since 2006. I have participated in each of these sessions (including a another successful intensive pediatric program

that was held over the past two weeks), and we have been very pleased by the depth of the content that is being offered and the outcomes achieved. In fact, nearly half of the graduates of one of the intensive courses have already submitted a research proposal and 80% of these have been funded. Quite a success story in its own right.

Informatics (Dr. Henry Lowe is the Program Leader): the STRIDE program <http://clinicalinformatics.stanford.edu/services/clinicaldata.html> has become increasingly integrated with hospital-based clinical electronic medical records (e.g., Epic at SHC and Cerner at LPCH), including pharmacy orders and radiology images. A more secure and operative database called REDcap is being introduced to replace less useful ones like Filemaker, Access and Excel. In addition, the informatics consultative progress has become more accessible and active, and it provided over 300 consultations since 2008. The Informatics program has also played a key role in developing the Spectrum Navigator and related websites.

Operations, Training and Compliance (Nick Gaich is the Program Leader): this program has had some significant accomplishments, including successfully negotiating a cost-based pricing for hospital associated clinical research (a breakthrough for clinical investigators) and other budget and billing enhancements -- including coordination with the Office of Sponsored Research and the Research Management Group. Of interest, a "study facilitator" service is available through the Study Navigator as of this month.

Clinical and Translational Research Unit (CTRU) led by Dr. Brandy Sikic: This program is the new version of the former GCRC (which the NIH is phasing out) and is largely an ambulatory research program. Research volumes are going up and the CTRU will be moving from Blake Wilbur to 1101 Welch en route to its final home at 800 Welch Road when the Jill and John Freidenrich Center for Translational Research is completed in 2012-2013. We are pleased that two inpatient beds have been approved for continuing location on H1 (the former home of the GCRC) for the indefinite future. As part of systems re-engineering, the CTRU/CTSA is collaborating with colleagues at the Graduate School of Business to evaluate process improvements in the cost accounting and efficiency of outpatient research.

Innovations and Pilots, led by Dr. Paul Yock, focuses on one of the fundamental underpinnings of the CTSA by awarding, in a competitive process, pilot and innovation seed grants. In 2009, 82 applications were received and 8 were funded for a range of diagnostic, therapeutic and device-based projects. The call for new applications was issued on September 1st (<http://spectrum.stanford.edu/researcher-resources/other/funding-ops/pilot-grants/335-call-for-proposals.html>). The SPARK and Biodesign Programs continue to thrive: SPARK has helped foster a successful ARRA Award in global health, and Biodesign has been a model for development at universities across the world.

Spectrum Supported Cores is led by Dr. Daria Mochly-Rosen and includes the Human Immune Monitoring Core (which is the brainchild of the Stanford Institute for Immunity, Transplantation and Infection), the High-Throughput Bioscience Center for drug and or target discovery, and the Tissue Microarray Histopathology Core.

Ethics, for which Dr. David Magnus is the Program Leader, has made important strides in courses and programs for ethics training for clinical investigators. This program also offers a consultative service that can be accessed through the Study Navigator.

Education (led by Dr. Charles Prober) has a number of initiatives, some of which I have highlighted in recent Newsletter, including the Stanford Society for Physician Scholars (see http://deansnewsletter.stanford.edu/archive/08_30_10.html#3).

Community Engagement is led by Dr. Marilyn Winkleby and Rhonda McClinton-Brown, and has developed a number of notable community partnerships (e.g., with the San Mateo County Department of Public Health, Kaiser Permanente, the Palo Alto Medical Foundation and a number of local community health center providers). This project provides technical assistance and career guidance; since the inception of the CTSA, it has engaged with 56 faculty and 46 community partners. Seed Project grants in community engagement are also being awarded, including five in July 2010.

Career Development and Diversity is led by Dr. Hannah Valentine and includes a number of novel programs such as the "Team Science Training Program," which has focused on topics ranging from conflict and negotiation to management of large interdisciplinary teams. In March 2010 a "Clinical and Translational Networking Program" was launched to bring faculty, students and postdocs together to address topics ranging from career development to working with the media and with industry. This September the second round of the "Clinical and Translational Research Scholars Program" was launched. In this program 18 fourth-year medical students from underrepresented backgrounds from around the USA visited Stanford for a 4-week sub-internship as a means of introducing them to our institution. Selected students are also participating in the Spectrum Intensive Course in Clinical Research -- including the one that took place two weeks ago.

Spectrum Child Health is led by Drs. Christy Sandborg and David Stevenson and is seeking ways to increase the efficiency and operations of pediatric clinical research, including ways to interact with the community. A number of pediatric research or clinical innovation awards have been given during the past year, and efforts are underway to monitor and track the impact of these awards on future funding and career development. In addition to these programs, efforts are underway to track and evaluate the impact of various programs and where possible to create alignments with the national community of CTSA Consortia. Clearly there has been a lot of activity through the Stanford CTSA over the past 2-3 years, and we can look forward to future programs that will enrich and enhance the environment and support for clinical and translational research at Stanford. There is no question that the value and importance of clinical research has risen and that unique opportunities exist for the future. One of these is the application of research methodology to improve the delivery of health care overall -- which we hope will be further enhanced by interactions with the new Stanford Clinical Excellence Research Center led by Dr. Arnie Milstein -- who joined Stanford this summer (see: http://deansnewsletter.stanford.edu/archive/05_24_10.html#2).

The Continuing Debate on Healthcare Reform

September 23rd marked the six-month anniversary of the signing of the Affordable Care Act (ACA), signed into law by President Obama on March 23, 2010. The lead-up to this historic legislation and the events surrounding its passage are topics I addressed with some frequency in past issues of the Newsletter. The ensuing months have been filled with rancorous debate and little expressed enthusiasm for the new legislation, despite the fact that it represents a rebasing of the frequently damaging practices of private insurance regarding denials for pre-existing illness,

limits on coverage and soaring costs. Importantly, the ACA offers the provision of medical care to most Americans.

One of the reasons for the current discord on healthcare reform is that its true purpose and goals were not explained in a coherent manner by the administration and its advocates. Even more damaging, though, are the political chasms and gridlock that have characterized Washington in the past several years that has led to hyperbole and lots of misinformation. Amazingly, the factual errors of those decrying healthcare reform were not adequately or promptly addressed, allowing them to alter perceptions of reality.

Over the last weeks and months the Administration and the Democrats have become amazingly silent on healthcare reform, and the Republicans are touting their plan to repeal or significantly limit the ACA. Together with the continuing loss of jobs, economic downturn and overall anger of the American public, the real and potential achievements on healthcare reform and the ACA have been muted at best. This is made worse by the fact that the ACA legislation is confusing to understand and the timelines for enactment makes promises too distant or too subject to future modification. Further, a continuing overriding concern is that the ACA does little to address cost control.

In the August 12th issue of the *New England Journal of Medicine*, Peter Orszag and Zeke Emmanuel attempt to address this in the Perspective entitled "Health Care Reform and Cost Control" (see: <http://www.nejm.org/doi/full/10.1056/NEJMp1006571>). Among the notable comments in their perspective article is that the ACA is "an ongoing, evolutionary process requiring continuous adjustment." This would seem to be an understatement.

Dr. Arnold Relman, former Editor of the *New England Journal of Medicine* and a noted authority on healthcare and medicine more broadly, published a valuable contribution in the September 30th edition of the *New York Review of Books* (see: <http://www.nybooks.com/articles/archives/2010/sep/30/health-care-disquieting-truth/>). Using his review of John Wennberg's "Tracking Medicine: A Researcher's Quest to Understand Health Care," Relman focuses on the geographically variegated costs of Medicare expenditures and their dissociation from quality outcomes -- the focus of the Dartmouth Atlas that Wennberg and his colleagues have brought to public attention. While there is debate about the validity of these associations and whether they are oversimplified, they do address the impact of provider practice on healthcare costs. The major drivers are technologies, drugs and expensive procedures, an issue highlighted in Atul Gawande's now well-known *New Yorker* (June 1, 2009) article entitled "The Cost Conundrum" (see: http://www.newyorker.com/reporting/2009/06/01/090601fa_fact_gawande).

Some of the features of the ACA are designed to address some of these cost conundrums. One is the Patient-Centered Outcomes Research Institute (PCORI), which is designed to empower physicians and patients with information on the effectiveness of medical technologies and interventions. The members of the PCORI were named this past week and include a number of highly regarded academics and thought leaders (see: <http://www.gao.gov/press/pcori2010sep23.html>). Another, albeit more controversial, committee will be the Independent Payment Advisory Board (IPAB), which will be charged with devising changes to Medicare's payment system, although some of these effects will not go into place until 2014.

At the annual meeting of the Association of Academic Health Centers (for which I have served as chair of the Board of Directors), which was held on September 23-24th, a number of these issues were discussed under the banner of "New Ideas and Strategies in the Era of Health Reform." In a plenary session Dr. Kavita Patel, now Director of Health Policy Programs at the New America Foundation, spoke of her role and that of the White House in devising and developing the ACA. She noted in passing that since the passage of the legislation most of the groups she has addressed have become less clear and often more distressed about the legislation - partly because of its uncertainty, long phase-in and the intense politics and rancor that have seized Washington and much of the country, especially with the economic downturn. That said, it was abundantly clear that our academic health center peers around the country are all bracing for coming changes even though the nature and their timeline is a matter of uncertainty.

Common wisdom shared at this national forum is that payments to providers from Medicare and private payers will decrease in the coming years, that incentives will be more aligned to outcomes and less to volume, that payments to hospitals for high-end services and care will be altered and that the focus will be on population based care and management. Most academic medical center leaders noted the importance of engineering efficiency and avoiding wherever possible expensive capital costs or hospital bed expansion. And a key observation is that medical centers will need to be more aligned and integrated -- a challenge even more acute for academic centers that have missions in education, research, patient care and community service.

These are challenges that we are well aware of and that we have addressed in part -- but have much more work to accomplish. As I have noted in prior communications (see: <http://deansnewsletter.stanford.edu/#4> and http://deansnewsletter.stanford.edu/archive/12_01_08.html) we need to be outstanding in discovery and innovation, and provide outstanding patient care, the highest possible quality, excellent patient services and low and competitive costs. While we do well in some of these areas we have much work to do in enhancing the patient experience and in reducing costs. We cannot wait for healthcare reform to mandate these changes -- we need to assume leadership now. I believe the integrated clinical planning that we are now pursuing with Stanford Hospital & Clinics (and that has already been achieved with the Lucile Packard Children's Hospital) is an important step. So are the improvements in focused attention on quality outcomes and, more recently on improving patient care. But high cost is a still major challenge and has to be an increasing area for focus now and in the future -- in both programmatic and capital expenditures. And I am optimistic that we could make progress and even assume a leadership in improving models of efficiency and effectiveness as the new Stanford Clinical Excellence Research Center gets underway.

Despite the challenges that lie ahead, the opportunities for improving Stanford Medicine and making it of even higher value to all the communities we serve is exciting and is a goal well worth our shared efforts.

Communication on Consulting from Provost Etchemendy

At our recent School of Medicine Executive Committee it became apparent that a recent communication from the Provost regarding faculty-consulting relationships had not been widely noted despite its broad dissemination. Because the communication is important we asked our department chairs to share the Provost's communication with their faculty. To further that dissemination, I am copying the Provost's September 1 message below. The new document

discussed by the Provost may be found in the Research Policy Handbook at <http://rph.stanford.edu/4-3A.html>.

From Provost John Etchemendy: As you know, Stanford encourages research relationships with other entities as a way to foster the transfer of knowledge gained through University research and scholarship for societal benefit. We also recognize, however, that our concern to preserve openness in research may be at odds with the need of for-profit companies to keep research information and materials proprietary. With these differences in mind, I would like to review Stanford's policies governing two types of agreements that faculty enter into without direct University oversight. These are personal consulting agreements and non-disclosure agreements (NDAs). As a Stanford faculty member, it is your responsibility to know the principles and policies that must be followed when entering into such agreements.

*If you enter into a consulting or non-disclosure agreement with a commercial entity, a copy of the attached summary of **STANFORD UNIVERSITY REQUIREMENTS FOR FACULTY CONSULTING ACTIVITIES AND AGREEMENTS** must be provided to the company.*

Consulting:

Any consulting agreements with outside entities should carefully delineate and separate your university responsibilities from consulting responsibilities. Specifically, these agreements must not involve or address Stanford University, or its resources and people, including students, postdoctoral scholars and staff. You are responsible for making sure that your consulting activity and the terms of any written agreements are consistent with requirements of the faculty Conflict of Commitment and Interest policy (<http://rph.stanford.edu/Chpt4.html>) and your university obligations related to inventions and other intellectual property (<http://rph.stanford.edu/5-1.html>). The School of Medicine also prohibits consulting that is solely or primarily for commercial marketing purposes (<http://med.stanford.edu/coi/siip/policy.html>). To avoid confusion, correspondence and agreements related to consulting activities must not use Stanford letterhead or appear to be Stanford documents. Finally, facilities and services of the University may not be used in connection with your consulting, except in a purely incidental way.

Non-Disclosure Agreements:

In their capacity as University employees, Stanford faculty and staff may not engage in confidential work for an entity other than Stanford. Confidential work for another entity may only be pursued during time allowed for consulting.

Any confidential information received for research purposes at Stanford must be incidental to University research activities and may not interfere with the participation of anyone at Stanford in the intellectually significant portions of the research activity (Openness in Research Policy; <http://rph.stanford.edu/2-6.html>). Within these important limits, if it becomes necessary for you to share confidential information with, or receive information from, another entity for your work at the University, you may personally sign a Confidentiality Disclosure Agreement (CDA) or Non-Disclosure Agreement (NDA). The agreement must state clearly that you are signing in your individual capacity and covers only your own activities. If it is necessary for those you supervise to receive confidential information, they must separately sign a confidentiality agreement, but only if the confidential information to be received is incidental and with approval of your school dean.

Some CDAs or NDAs presented to faculty for signing may contain intellectual property provisions impacting Stanford's rights in patents, copyrights, or patentable technology or

copyrightable works. Faculty may not sign any agreement that could affect Stanford's or other Stanford researchers' rights in intellectual property or your Stanford obligations related to intellectual property.

The CDA/NDA must not include Stanford University as a party. Individual researchers, faculty members and other employees have no authority to sign CDAs or NDAs on behalf of the University, their school or department, or any other division or department of the University. Stanford generally does not sign CDA/NDAs on behalf of the University, because there is no institutional mechanism to ensure the confidentiality of information received.

NOTE: The summary of Stanford's policies will be available for downloading on the Research Policy Handbook website (<http://rph.stanford.edu>), the Office of Technology Licensing website, and from your school dean's office.

Please contact your school dean's office or the office of the Dean of Research to discuss any questions that you may have concerning consulting agreements; the Industrial Contracts Office will advise about CDA/NDAs.

For the School of Medicine, Dr. Harry Greenberg, Senior Associate Dean for Research, would be pleased to address any questions or concerns you have. You can reach Dr. Greenberg at: harry.greenberg@stanford.edu.

Office of Medical Development Helps Prepare Faculty for Fundraising

On September 14th and 17th, Laurel Price Jones, Associate Vice President for Medical Development and Alumni Affairs, and Barbara Clemons, Assistant Vice President for Medical Development, coordinated two four-hour intensive workshops on philanthropy for faculty leaders. These interactive sessions were led by Mr. Joe Golding from Advancement Resources, a national leader in research-based development training for medical professionals. They enabled faculty leaders and staff from the development offices of the School of Medicine, Stanford Hospital & Clinics and the Lucile Packard Children's Hospital to join together in discussions about "grateful patients and families" as well as ways to assess the mindset and intent of potential donors. Nearly 70 faculty members participated, and many have already shared their positive reflections on the value of this intensive exposure to fundraising and philanthropy.

We anticipate that Advancement Resources will launch a more in-depth seminar exclusively for academic researchers this spring, and our development team will be following up to assist interested faculty in expanding their fundraising efforts. Whether or not you attended one of these workshops, a development officer will be glad to speak with you. If you don't know who is assigned to your program, contact the Office of Medical Development (OMD) at 650-234-0600.

Based on the observations of attendees and organizers, some of the highlights and key lessons of the seminar included:

Nearly 90% of all gifts come from individuals (including family foundations).

Forty percent of donors who made gifts of \$1M or more in 2009 had no knowledge of the organization seven years earlier.

There is a big difference between a loyalty gift and a passion gift. The biggest gifts of a donor's lifetime are almost always the latter. *(Parenthetically, I would include some of the major gifts we received for the Li Ka Shing Center for Learning and Knowledge and the Lorry Lokey Stem Cell*

Research Building in the category of "passion gifts" based on a compelling and exciting vision and opportunity).

Fundraising is not about prying money from the reluctant; it's about providing opportunities for donors to realize their dreams, and sometimes even to start a healing process.

The three key roles for faculty in fundraising (note, asking for money is not on the list -- which is something I pointed out during my introductory comments):

1. **Articulate a compelling vision story.** Think big ideas -- they attract big gifts. Show the impact on people, not the institution. Paint a picture of how the future could look. Focus on only 3-5 goals. Describe your work in simple metaphors (e.g., a cancer stem cell's role as the queen bee in a beehive).
2. **Help get the donor's personal story on the table.** "Development magic" happens when the donor's personal story connects to an organizational initiative (project, program, vision story).
3. **Provide development referrals.** Bringing in a development professional changes the dynamic, uses your time most efficiently, and preserves the physician-patient relationship.

I noted in my August 30th Newsletter that the School of Medicine has now passed the \$1 billion mark in the Stanford Challenge campaign, which is still underway (http://deansnewsletter.stanford.edu/archive/08_30_10.html#10). But we still have a long way to go to fulfill our many dreams, aspirations and critical needs -- and to do that we will benefit from the help and assistance of our faculty, a number of whom are now much better educated about fundraising and medical development. More to come (I hope in every way).

Emergency Preparedness: Earthquake (Drill) on October 7th

On October 7th, at an undisclosed time, Stanford University will conduct an emergency earthquake evacuation drill that will impact the *entire campus* (except for the hospitals) as well as a number of off-site facilities where School of Medicine faculty, staff and students are located. In addition to all on-campus buildings, the off-site facilities that will participate in the drill include 1050 and 1070 Arastradero, 855 and 1501 California Avenue, 2700 Sand Hill Road and Stanford Menlo Park. The October 7th exercise is designed to simulate the immediate response to an earthquake (or similar emergency). Information about the drill is available at: <http://evacdrrill.stanford.edu>.

The drill will begin with the outdoor AlertSU warning system which signals a continuous warning tone. This is what would happen during a true emergency. The siren is expected to last for about 45 seconds (but this could vary during an actual emergency). When the siren begins you should "duck, cover and hold" (see http://www.stanford.edu/dept/EHS/prod/general/erprep/2010_emer_evac_index.html for more details) until the siren stops. Specific instructions for faculty, students and staff are displayed. At that point you should gather your belongings (I would imagine your laptop and/or iPad will be among them) and report to your assigned Emergency Assembly Point (EAP). If you don't know where your EAP is located it would be a good idea to find out prior to the October 7th drill. Your department DFA can provide the location or you could check at the Environmental Health and Safety Website at <http://www.stanford.edu/dept/EHS/prod/general/erprep/eap/>.

All staff and faculty should check in at their local EAP per departmental evacuation procedures.

Students in residences should check in at their local EAP. All students will receive a message from the AlertSU mass notification system. Students should respond to the voice prompts from the system to check in electronically.

For more information on personal preparedness, visit any of the following sites:

Ready.gov <http://www.ready.gov/> 72 Hours.org <http://72hours.org/>

The Great California Shakeout (October

21) <http://www.shakeout.org/> <http://www.shakeout.org/dropcoverholdon/>

Play "Beat the Quake" <http://www.dropcoverholdon.org/>

For questions or more information, send emails to preparedness@lists.stanford.edu

The Department of Anesthesia Celebrates Its 50th Anniversary

The Department of Anesthesia celebrated its first 50 years on September 24-25. The festivities included a wonderful scientific program and opportunities for social gatherings, reunions and renewals. The Department has grown in breadth and depth across all missions of education, research and patient care and has particularly thrived during the last decade under the terrific leadership of Dr. Ron Pearl, the Richard K Erika N Richards Professor of Anesthesia and Chair. The department now includes 150 current faculty members and 67 current residents as well as over 565 graduates. Its programs extend from the operating room to obstetrics, pediatrics, the intensive care unit, the pain clinic, and the ambulatory centers to the immersive learning center. To commemorate its anniversary, the department has produced a wonderful publication entitled Stanford Anesthesia, Fifty Years of Excellence. From this I offer Dr. Pearl's conclusion to his opening letter to faculty, students, staff and alumni:

"Looking back on the first half-century of the department, we see a tradition of excellence in clinical care, research, education, leadership and service. Today these elements are integrated in a department which is leading the field and continuing to define the expanding specialty of anesthesiology and perioperative care. We can look forward to the next half-century with confidence and optimism as we celebrate what we have achieved over the first fifty years"

I had the privilege to participate in some of the events surrounding the celebration and ask that you join me in congratulating the Department of Anesthesia and wishing it well for the future.

Stanford University Employee Survey to be Conducted this Fall

The School of Medicine's 3,800 staff employees are one of our most valuable resources. Our important research, education, and patient care activities could not be realized without the dedication, commitment, and day-to-day engagement of our staff.

This October, Stanford University is sponsoring a Stanford Employee Survey. The School of Medicine will be participating in this effort, which will give School employees the opportunity to provide confidential feedback to an external vendor about their experience in the SoM work environment, and will in turn give the school vital information to improve our efforts to make the School an ever better place to work.

The survey results will be shared -- in aggregate form -- with employees, supervisors, and managers. Supervisors and managers will then have the opportunity to hold discussions with their employees to understand the input and develop and implement action plans to address any issues or trends that surface through the survey process. The Human Resource Group will support supervisors and managers through the action plan process.

Other Stanford schools and business units are also participating in the survey. The process was inaugurated in spring 2010, with six schools and central areas participating. This fall, close to 6,000 employees will participate in the remaining schools, independent labs, and central areas.

An experienced outside vendor has been engaged to collect the data and prepare reports that will convey aggregate results; no results will be linked to any individual employee's name, and supervisors and managers will not be told which specific employees participated in the survey. Groups participating in the spring 2010 survey process gave feedback that the online survey was easy to use and took no more than 10-15 minutes to complete. The more employees who complete the survey, the easier it becomes to identify themes or trends across the School that, if strengthened, would help us become an ever better place to work.

More information about the survey and how to participate will be communicated in late September. We hope that all employees will take time to respond to the survey.

Awards and Honors

Dr. Paul Auerbach, Professor of Surgery (Emergency Medicine), was named the inaugural recipient of the Redlich Family Professorship at a celebration on September 14th. This professorship, the first in Emergency Medicine, is the result of a generous gift from Christopher Redlich. Of note, this is one of very few professorships in emergency medicine anywhere, and it brings distinction to the Division of Emergency Medicine, the Department of Surgery and Stanford. We are grateful to the generosity of Mr. Redlich and offer our congratulations to Dr. Auerbach.

Appointments and Promotions

Meenakshi Aggarwal has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 4/1/2010.

Ritu Asija has been reappointed as Clinical Assistant Professor of Pediatrics, effective 7/1/2010. Profile: http://med.stanford.edu/profiles/Ritu_Asija/

Themistocles (Tim) L. Assimes has been appointed as Assistant Professor of Medicine, effective 10/1/2010. Profile: http://med.stanford.edu/profiles/Themistocles_Assimes/

Rebecca Blankenburg has been promoted to Clinical Assistant Professor of Pediatrics, effective 10/1/2010. Profile: http://med.stanford.edu/profiles/Rebecca_Blankenburg

Hollister P. Brewster has been reappointed as Clinical Professor (Affiliated) of Medicine, effective 4/1/2010.

Despina G. Contopoulos-Ioannidis has been appointed as Clinical Associate Professor of Medicine, effective 10/1/2010.

Alimorad G. Djalali has been promoted to Clinical Assistant Professor of Anesthesia, effective 10/1/2010.

Huy Do has been reappointed as Associate Professor of Radiology and, by courtesy, of Neurosurgery, at the Stanford University Medical Center, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Huy_Do/

Amit Etkin has been appointed as Assistant Professor of Psychiatry and Behavioral Sciences, effective 10/1/2010.

Profile: http://med.stanford.edu/profiles/Amit_Etkin/

Christian Eversull has been appointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 7/15/2010.

Lisa W. Wise-Faberowski has been appointed as Assistant Professor of Anesthesia at the Stanford University Medical Center, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Lisa_Wise-Faberowski/

Paul Ford has been reappointed as Clinical Associate Professor of Medicine, effective 8/1/2010.

Profile: http://med.stanford.edu/profiles/Paul_Ford/

Francois Haddad has been promoted to Clinical Assistant Professor of Medicine, effective 10/1/2010.

Profile: http://med.stanford.edu/profiles/Francois_Haddad/

Catherine A. Heaney has been reappointed as Associate Professor (Teaching) of Psychology and of Medicine, effective 10/1/2010.

Profile: http://med.stanford.edu/profiles/Catherine_Heaney/

Joyce Hsu has been reappointed as Clinical Assistant Professor of Pediatrics, effective 7/1/2010.

Profile: http://med.stanford.edu/profiles/Joyce_Hsu/

Andrei H. Iagaru has been appointed as Assistant Professor of Radiology at the Stanford University Medical Center, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Themistocles_Assimes/

John Ioannidis has been appointed as Professor of Medicine, effective 10/1/2010.

Profile: http://med.stanford.edu/profiles/John_Ioannidis/

Peter E. Kane has been reappointed as Clinical Professor of Radiology, effective 9/1/2010.

Jennifer Kao has been reappointed as Clinical Associate Professor of Radiology, effective 9/1/2010.

Mailhgan Kavanagh has been promoted to Clinical Assistant Professor (Affiliated) of Surgery, effective 7/1/2010.

Stephen King has been reappointed as Clinical Assistant Professor (Affiliated) of Anesthesia, effective 9/1/2010.

Sirisha Komakula has been appointed as Clinical Assistant Professor of Radiology, effective 10/1/2010.

Uri Ladabaum has been appointed as Associate Professor of Medicine at the Stanford University Medical Center, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Uri_Ladabaum/

Maarten Lansberg has been reappointed as Assistant Professor of Neurology and Neurological Sciences and, by courtesy, of Neurosurgery, effective 10/1/2010.

Profile: http://med.stanford.edu/profiles/Maarten_Lansberg/

Matthew Mell has been appointed as Assistant Professor of Surgery at the Stanford University Medical Center, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Matthew_Mell/

Elizabeth D. Mellins has been promoted as Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Elizabeth_Mellins/

Alexander Moskovitz has been promoted to Clinical Assistant Professor (Affiliated) of Surgery, effective 8/1/2010.

Sujata Patel has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Sujata_Patel/

Zina Zarshenas Payman has been reappointed as Clinical Assistant Professor of Radiology, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Zina_Payman/

Rajesh Punj has been appointed as Clinical Assistant Professor of Pediatrics, effective 10/16/2010.

Profile: http://med.stanford.edu/profiles/Rajesh_Punj/

James V. Quinn has been promoted as Professor of Surgery at the Stanford University Medical Center, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/James_Quinn/

Vishnupriya Rajagopal has been promoted to Clinical Assistant Professor of Surgery, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Vishnupriya_Rajagopal/

Jessica Rose has been promoted as Associate Professor of Orthopaedic Surgery at the Lucile Salter Packard Children's Hospital and at the Stanford University Medical Center, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Jessica_Rose/

John Stevenson has been reappointed as Clinical Assistant Professor (Affiliated) of Surgery, effective 9/1/2010.

Chih Kwang Sung has been appointed as Assistant Professor of Otolaryngology -- Head and Neck Surgery at the Stanford University Medical Center, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Chih_Kwang_Sung/

Christopher Talluto has been promoted to Clinical Assistant Professor of Pediatrics, effective 8/1/2010.

Profile: http://med.stanford.edu/profiles/Christopher_Talluto/

Julie Tinklenberg has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Julie_Tinklenberg/

Jarred W. Younger has been appointed as Assistant Professor (Research) of Anesthesia effective 10/1/2010.

Profile: http://med.stanford.edu/profiles/Jarred_Younger/

Michael M. Zeineh has been appointed as Assistant Professor of Radiology at the Stanford University Medical Center, effective 9/1/2010.

Profile: http://med.stanford.edu/profiles/Michael_Zeineh/

Ashwini M. Zenooz has been appointed as Clinical Assistant Professor (Affiliated) of Radiology, effective 8/1/2010.

Dean's Newsletter October 11, 2010

Li Ka Shing Renews Education Facilities for the Next 50 Years (and Beyond)

September 29, 2010 marked an important milestone in the distinguished history of the Stanford University School of Medicine. After a decade of planning and varied expectations, the official opening of the Li Ka Shing Center for Learning and Knowledge took place with excitement, enthusiasm and satisfaction. President John Hennessy presided over the dedication ceremony, which was graced by the presence of a number of the donors and benefactors who made the dream of new education facilities a wonderful reality. We were deeply honored to have Mr. Li Ka Shing, who generously provided the naming gift for what is now commonly referred to as the LKSC, in attendance. The connections between Mr. Li and Stanford began in a deeply personal way in 1982 (see below) and will extend far into the future, to the great benefit of current and future generations of Stanford students. The LKSC symbolizes the transformation of medical education and the important role Stanford will play in the education and training of future leaders in medicine and science.

Not unexpectedly, there is a back-story to the journey we celebrated on September 29th. The beginning and ending of life journeys are often unpredictable, and they frequently have moments that, in retrospect, can be seen as punctuation marks along the way. For me, the journey to the LKSC began in December of 2000, right after I agreed to come to Stanford as Dean. It was then that I was “advised” about the nearly two decades of warnings from the LCME (Liaison Committee on Medical Education) to Stanford about the need to address perceived deficiencies in its classroom and library facilities. Those admonitions resulted in a vote by the LCME in 1999

that barely escaped probationary accreditation status. That certainly got Stanford's attention, and it prompted the development of a plan to develop new education facilities as part of an overall renovation plan for the original 1959 Edward D. Stone complex that was known at the time as the GALE Project.

GALE is the acronym for the four School of Medicine buildings: Grant, Alway, Lane and Edwards. The estimated cost of the renovation was approximately \$185 million, and the project had advanced to the point of receiving concept approval by the University Board of Trustees. One of my jobs was going to be to raise the money for this project and oversee its implementation. I quickly learned (within days of agreeing to come to Stanford) that GALE was a project with a range of vocal supporters and decriers. What struck me, however, was that the proposed education renovation was a well-founded educational, programmatic and strategic initiative, but it aimed to fill a number of diverse needs beyond education. Accordingly, in the months prior to my arrival as Dean in April 2001, I reviewed all the documents and commentaries I could find on the project, received opinion and insights from a broad range of faculty, students and staff, and consulted with the leaders of the LCME, the School's Executive Committee and University leadership. That led to the decision, in February 2001, to abandon GALE— which resulted in starting a new journey toward what would eventually become the LKSC.

Like all adventures, the road the LKSC has been filled with uncertainty as well as expectation. It has had advocates and critics, who themselves sometimes exchanged roles and opinions. Among the first important steps was to better define the programmatic needs for education, which began at the same time as a parallel journey of renewing and revising the curriculum for medical student education. What we refer to as “The New Stanford Curriculum” was introduced in the Fall of 2003. It helped define our new directions in education and the kinds of resources and facilities we would need to support them. The development of the new curriculum engaged many dozens of faculty, students and staff and provided a replacement for a curriculum that had become so “flexible” that it lacked focus and definition.

Building consensus around the New Stanford Curriculum also required a fundamental change in the financing of education through the School's operating budget – another somewhat contentious challenge. Both curriculum reform and the funding for education remain challenges today and will surely become even more so as we launch new major efforts addressing the future of medical education (see: http://deansnewsletter.stanford.edu/archive/09_13_10.html#1) along with initiatives to think further about graduate education (see below) and postdoctoral training (see: http://deansnewsletter.stanford.edu/archive/07_26_10.html#2). How these parts of the journey will evolve remains to be seen – but many of them began with the creative thinking about the Stanford Five Year Plan that began in the late 1950s, nearly 50 years following the seminal Flexner report of 1910.

The major task of defining the future learning and knowledge center began almost in concert with the revisions of the curriculum in 2002-2003. It too was a process that engaged many dozens if not hundreds of individuals over a period of several years. The project went from GALE to SMILE (the Stanford Medicine Immersive Learning Environment) to the LKC (the Learning and Knowledge Center) and finally, to the LKSC (the Li Ka Shing Center for Learning

and Knowledge). The original hope was for a building of approximately 200,000 gasf (gross available square feet), but the space limitations of Stanford's General Use Permit (GUP) allocation to this project reduced its size to the current 120,000 gasf of the LKSC. This meant that bringing together the many important people who support the education program and services would be left for another day – and the building focused on students and learners.

While the major focus is medical and graduate students, I believe that the LKSC will serve all learners – high school, college, medical and graduate students, residents and postdocs, faculty and continuing medical education, and our community of learners locally and globally. And as it evolved, the technological *tour de force* that now defines the LKSC permits its walls to be permeable, so that knowledge and information can be shared, instantaneously, throughout medical center, the university – and the world. The opportunities for new linkages, interfaces and communication is truly nonpareil.

Of course the idea for a bold new center for learning and knowledge required extraordinary financial resources to bring it to fruition – which many forecast would be difficult if not impossible to achieve. The road to the LKSC as we know it today was nearly blocked or redirected a number of times - until members of our community began stepping forward with gifts of support and commitment. These included contributions from every department in the School of Medicine – and in the case of the Departments of Genetics, Pathology and Radiology, gifts of \$1 million each. That kind of support anchored our efforts, communicated a shared commitment, and was coupled with other programmatic support from other school resources.

Importantly, the Stanford University Medical Center Alumni made wonderful annual gifts to the LKSC. So too did many of our faculty as private donors along with many dozens of community supporters and foundations. A number of incredible individuals made personal gifts of great significance, including Millie and Paul Berg, Hon Mai and Joe Goodman, Jerry Yang and Akiko Yamazaki, CJ Huang and Ha Lin Yip, Dr. Roy Stanford and Dr. Keith Gianni. And of course we were fortunate to receive a truly major gift from Mr. Li Ka Shing. I thank each of these major donors but I am grateful to everyone who offered support – financial or programmatic – to help us reach this long awaited goal.

When the journey toward a new learning and knowledge center began it was certainly not clear that Mr. Li Ka Shing would play such a central role. Nor was it necessarily clear to him. But as we learned at the September 29th Dedication, Mr. Li had begun his own personal journey that ultimately intersected with ours. Here is how he put it in his remarks.

Comments from Mr. Li Ka Shing on the Dedication of the Learning and Knowledge Center

Today is the culmination of a journey that began decades ago. On a warm and beautiful afternoon back in 1982, I brought my freshman son, Victor, to Stanford. I was a proud parent as we strolled down the picturesque Palm Drive toward the Oval. It was a moment I will not forget -- my son was receiving a university education, something I could only dream of. And he was doing it at Stanford!

I can still recall, at one point in our walk, stopping for a moment, turning to him and saying: "This is the first time in my life that I feel true envy of your good fortune -- to have the

opportunity to be a part of this great institution." It is an opportunity that countless students from all over the world have enjoyed -- not only to attend here, but to have their minds and spirits broadened through a rigorous fusing of intellect and imagination. Lives have been enriched here, ennobled with a sense of service. And service is the hallmark of a life well lived.

The elite students of this great university, who become elite leaders, are not content to be moralizing spectators. They are explorers and discoverers search for, and finding solutions, to the great challenges of our complex world. They know the higher order of the ennobled human spirit, and they measure themselves by that standard.

I hope this spirit permeates Stanford. I know that on this campus I have experienced it first hand. After seeing Victor off that day, I wandered alone through the campus. At one point I stopped and knelt down to take a photograph of a beautiful western bluebird in the grass. I became so focused on the image of the bird through my viewfinder that only when I turned did I embarrassingly realize that I had blocked the path of dozens of students on their bicycles. But rather than rush me, many of them held their fingers to their lips, letting each other know to stop and remain quiet in an effort not to frighten the bird while I clicked the shutter.

Their smiles overwhelmed me then and will stay in my heart forever. The photograph of the western bluebird has long vanished, but the noble and gracious gesture of those students laid the foundation of my love for Stanford and the eventual project that we now celebrate. Today with the dedication of this building, I am now part of this great institution, and for that I am most happy and very honored.

As part of the journey I had the opportunity to meet with Mr. Li a number of times in Hong Kong and to share with him the vision of what is now the LKSC. Many of his close colleagues and advisors played important roles in guiding the process – most notably Ms. Solina Chau and Dr. Freida Law from the Li Ka Shing Foundation – as well as Dr. Alan Yeung, the Li Ka Shing Professor and Chief of Cardiology in the Department of Medicine at Stanford. But to say that the process was easy or predictable would not be honest. The promissory notes of support ebbed and flowed – but were ultimately achieved when Mr. Li made his decision that supporting the future of medical education was important, not only to Stanford but also to the world.

Mr. Li's sharing of this brief moment links us to his personal journey with Stanford, begun in 1986, in a deeply personal way. I must say that in 1986 Stanford was not on my personal radar screen, as I was deeply involved in work in pediatric AIDS in Bethesda at the NIH. But journeys have unpredictable ways of interconnecting. As I look back I can now see some of these connections over time and space, but until September 29th I never realized that it was a western bluebird that connected these threads. Generations of current and future students will be grateful to Mr. Li and, of course, to the bluebird that served as such a powerful symbol of connection to him. We are connected through history in ways that sometimes surprise but that can give flight to great new ideas.

Advancing Innovation Through Dialogues with Academia, Regulatory Agencies, Industry and the Public

Over the past two weeks several intersecting events brought together communities that have sometimes been at odds. Importantly, these communities need to be aligned if we are to achieve

excellence in innovation and discovery and in their translation to improve human health. On occasion, the balance between creative innovation and protecting human safety can swing too much in one direction or another. As physicians and scientists, we seek to develop discoveries, tools, devices and procedures that improve the diagnosis, treatment and prevention of human illness. At times, the perceived benefits of medical innovation can skirt the edges of safety. On the other hand, concerns for safety can sometimes result in the over-regulation of innovation – even running the risk of stifling it. Further, the views and interpretations of policies by regulatory agencies, including the Food and Drug Administration, can swing from under to over-regulation, depending on the philosophy and beliefs of leaders and the political process that sometimes govern resource allocations and appropriations. While this dipole applies to all forms of innovation, it is perhaps most challenging for medical devices, given the close involvement of the inventor with the development of a device and the methodology used to evaluate its efficacy and safety – and how they are viewed by the FDA and perceived by the public.

In tandem with the balance between innovation, assessment, safety and regulation is the interface and interplay between academia and industry. This also has much to do with the support and development of innovation, but, in addition, it juxtaposes the goal of fostering the public good with the financial interests of individuals and business. It is frequently the case that conflict of interest becomes a necessary concern. But balance is important. Conflicts of interest are inherent to discovery and to interrelations within academia and with industry as well as with other public and private sectors. How those conflicts are handled and addressed can foster discovery and public good or can stifle them and promote greed and loss of the public trust. The interactions between industry and academia in particular have been the topic of major news stories and some scandals and have been very much part of Stanford's leadership in establishing policies academic–industry relations. This is a topic which I have discussed in a number of past Dean's Newsletters and which is well delineated in our policies (see <http://med.stanford.edu/coi/siip/policy.html>) as well as those of other universities, industry and the healthcare legislation of the Affordable Care Act.

As I noted, two separate meetings and events brought these issues into focus and fostered important dialogue. The first took place at Stanford on September 27th and 28th under the auspices of the Biodesign Program and was led by Dr. Paul Yock, the Martha Meier Weiland Professor in the School of Medicine and Professor of Bioengineering and, by courtesy, of Mechanical Engineering and at the GSB. The second was sponsored by Spectrum and was led by Dr. Steve Alexander, Professor of Pediatrics and Chief of the Division of Nephrology in the Department of Pediatrics. These sessions brought together leaders from the FDA (primarily the Center of Devices and Radiological Health [CDRH]), the device industry and venture capital to discuss the policies regulating the approval of new devices.

There is a widening view that the regulatory policies of the FDA have migrated toward greater stringency over the last couple of years and that this is negatively impacting device development and innovation. At an extreme, there is a view that policies that are too stringent will move the biotechnology and device innovations away from the USA and to Europe or Asia. As an observer of these discussions, what impressed me was the willingness of the FDA's CDRH leaders to listen to the concerns expressed by faculty, industry and venture capital leaders. While discussion alone is insufficient, it is a necessary beginning, and I commend Drs. Yock,

Alexander and their colleagues for initiating and facilitating these discussions –which will hopefully continue over the months and years ahead.

In a separate but related manner I participated in a National Dialogue for Healthcare Innovation Summit on Physician-Industry Collaboration held on October 4th in Washington, DC. Moderated by Susan Dentzer, the Editor-in-Chief of Health Affairs and health issues analyst for the PBS NewsHour, the Summit brought industry and academic leaders together with government and public advocacy leaders. Although at a high level, the discussion groups addressed the big themes: the challenges and opportunities of collaboration between academia and industry; the current practices and gaps in academia – industry relations; what collaboration means for the patient; and the role of government and private payers in physician-industry collaboration.

The attendees and participants represented leaders from across these domains and the dialogue was quite honest and sometimes spirited. There is a broad perception that recalibration of the physician-industry relationship is needed, but the details about what that means and how it can – or should – be achieved has many different perspectives. Nevertheless, the fact that this Summit occurred and that others are planned is important in its own right. Of course the devil is always in the details – but transparency, dialogue, and an effort to reach balance and integrity are important beginnings. Hopefully there will be much more to follow.

Beginning to Think about Graduate Education

On Saturday morning, October 9th, we held the third of our “think tanks” focused on the School’s broad educational missions. We began in July with our postdoctoral training programs (http://deansnewsletter.stanford.edu/archive/07_26_10.html#2), continued in August with medical education (http://deansnewsletter.stanford.edu/archive/09_13_10.html#1), and concluded with this session, which centered on our PhD programs. These think tanks were not scheduled by priority or order but by the availability of participants. As with the first two think tanks, over 30 faculty, students and staff gathered in the LKSC Boardroom and engaged in wide-ranging and candid discussion about what is working in our doctoral training programs and what is not, and we brainstormed about how we might do things differently in the future. The outcome of the think tank will be establishing work groups to further define the ideas that arose in the discussion and to use them to shape and refine their recommendations for broad consideration.

Many ideas emerged from the discussion that you will be hearing about in the months ahead. But to give you a flavor of the discussion, here are a few of the themes that seemed to resonate most strongly:

- The recognition that not all of our PhD students are looking toward academic positions when they finish their training. The reasons for this vary and are probably quite individualized. They include: the recognition that there are not enough academic positions to accommodate all the PhDs being trained (one participant commented that we are in a “PhD bubble”); a diminution in interest in an academic career by some students as their training proceeds; and an increase in interest in other types of scientific careers. Regardless of the reasons, the participants agreed that students should be offered opportunities to explore career options beyond academia and to develop the skills that will be required in other settings as well as in academia. These

might include short modules in specific skills such as leadership and how to work collaboratively as well as internship opportunities in industry.

- An appreciation of the fundamental value of the doctoral training model of learning to: think independently, design experiments, complete experiments, and communicate the results - and that this model provides education that serves our graduates well in whatever setting they find themselves. There were strong views that this model of education was the core value of a PhD and should not be changed or tampered with.
- The deep and pervasive influence of the financial models and constraints on our PhD programs. The decrease in training grant funding and the disincentives now in the system for PIs to take on a graduate student instead of hiring a postdoctoral fellow, including the pressure on faculty to be more productive, were brought up. The ideal of having all students be fully funded was raised, although the financial means required to accomplish this would be enormous.
- The question of time to degree and whether it is too long. There was lively debate on this point, with comments that the current time provides students opportunities to take risks, learn from mistakes and go on to complete successful programs. In contrast, adding up a graduate degree time of roughly 5.5 years and another 3-5 in postdoctoral training makes for a very long time before beginning an independent career.
- The desirability of undertaking a thorough review of the PhD curriculum, which has not been done for a decade. This should include not just the content of the curriculum but also the strategies for teaching and learning, since, due to the rapid and continuing advances in technology, the ways students learn now are very different from in the past.
- The issue of diversity, which is one in which we are still very far from where we need to be. Barriers to increasing the diversity of our graduate student population were discussed, such as competition from our peer institutions, including the simple one of the cost of applying to Stanford relative to our peers; the role of GRE scores in the admissions process, which may be problematic; and our continuing relative lack of minority faculty.

Now that we have completed our educational “think tanks,” the work of sorting through the ideas, identifying overlapping issues as well as those unique to each group, and prioritizing ideas for development into recommendations and action plans has begun. Stay tuned!

The National Research Center Ranks Doctoral Programs

On Tuesday, September 28th, the National Research Council released its long-awaited assessment of research doctoral programs. The last NRC rankings were done in 1995, and the 2010 report and rankings have been in preparation for several years. 47 of Stanford’s doctoral programs were included, including nine in the School of Medicine: Biochemistry, Cancer Biology, Chemical and Systems Biology, Developmental Biology, Genetics, Immunology, Microbiology and Immunology, Molecular and Cellular Physiology and Neurosciences.

(Biomedical Informatics, as an emerging field, was not ranked.) The September 28 issue of the Stanford Report provides this useful summary of the methodology used in the assessment (<http://news.stanford.edu/news/2010/september/doctoral-program-ratings-092810.html>):

Using data from the 2005-06 academic year, the NRC based the ratings on 20 variables including measures of faculty research activity, student support and outcomes, and faculty and student demographics. Stanford participated in the data collection process by providing data about its programs, faculty and students to the NRC in 2006-07. Many Stanford faculty members completed a survey conducted in spring 2007. Some data were also developed directly by the NRC, including data on publications, citations and grants.

Each rated program received two different overall measures – one based on faculty opinions of the relative importance of the various program factors (dubbed S-rankings, for Survey), and one based on a regression analysis linking reputational scores to the program factors (R-rankings).

Also, instead of the usual single-number ranking, each of the five NRC ratings is being reported in a range of rankings representing the middle 90 percent. For example, a program could have a rating between 5 (5 percent) and 13 (95 percent). The range means that 10 percent of the time, the rating might fall outside the range. The range is intended to reflect the inherent differences among raters, statistical uncertainty and variability in year-to-year data.

So what does all this mean? Well, on the surface it means that, in contrast to the earlier NRC's rankings and in contrast to other published rankings, such as those by the US News and World Reports, about which I have commented at length in earlier Newsletters (see:

http://deansnewsletter.stanford.edu/archive/04_19_10.html#4 and

http://deansnewsletter.stanford.edu/archive/06_28_10.html#3), these results are more reflective of the complexity of both institutions and statistical methodologies. By not reducing a program to a single number, the results can be more nuanced. Each program ends up with a varied set of ranges, so that, for example, a program can rank very high in the overall category but relatively low in the area of student support and outcomes.

However, the reality is that, as soon as the results were released, individuals and institutions began devising ways to use the results to come up with a single rank. There must be something inherent in us that wants to know “who is # 1?” and “where are we in the rankings?” And that is what we have seen. One way of doing this is to use the 5th percentile ranking of the overall S-ranking; that is, the rank that falls at the upper 5th percentile of the distribution that resulted from the statistical analyses of the survey results. When that ranking is used for School of Medicine programs, the results are very good indeed: all of our programs are ranked quite highly. However, we do less well in measures of diversity and in student support and outcomes. And these too are areas we need to focus on to truly establish the levels of excellence we aspire to in our education programs.

In the end, the value of the NRC assessments will be determined by their usefulness to programs, departments and schools. I hope they will be used to examine where improvements can be made

in the quality of our PhD programs across all the areas assessed by the NRC, to the benefit of our students.

The Journey To Improving Quality and the Patient Experience

My list of critical factors needed to secure the success of an academic medical center includes being a leader in innovation and discovery, a provider of outstanding state-of-the-art patient care, excellent in measures of quality, safety and outcomes, outstanding in patient service and clear and transparent in the value benefit and cost of patient care. At Stanford we do some these in an outstanding manner, have made progress in others and have a long ways to go in some (most notably the patient experience and the value benefit and cost of care).

While it is important to keep striving for greater excellence, it is also important to recognize and even celebrate accomplishments when they take place. Accordingly I offer my commendation to Stanford Hospital & Clinics and our faculty and medical staff for the continued progress they have made in improving quality performance as measured by the annual University Healthsystem Consortium (UHC) Quality and Accountability Scorecard. While nothing is perfect, this scorecard is likely the most comprehensive measure of quality, and it permits us to assess how we are doing against national metrics – including other academic medical centers across the nation. This past week SHC was informed that its 2010 ranking now places it in the top quartile among 98 academic medical centers. This is a major (and I mean major) improvement from five years ago. Thanks to the concerted effort of the SHC, School and Medical Staff leadership, progress has been made each year –and this year’s ranking is the best we have achieved so far.

These results are a tribute to the spirit of collaboration within our institution and across the medical center. This could not have been accomplished without the dedicated work of our clinical chairs, faculty and hospital leaders and staff. It is also a reflection of the leadership of Dr. Kevin Tabb, Chief Medical Officer at SHC, Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs, and Dr. Bryan Bohman, elected Chief of Staff at SHC.

I commend everyone who has contributed to these results but also note that much work remains. Rankings are only one aspect of quality care. As I noted above, patient service and patient satisfaction is an arena in which we still need to show continued and very significant improvement. And we have much work to do to deliver outstanding care, with the highest quality, best patient service and great innovation at a lower cost. But the progress that we have made to date does illustrate what we can accomplish when we set priorities, work collaboratively and strive to do the best for the patients we serve.

Accolades to DARE

Three years ago Dr. Patti Gumport, Vice Provost for Graduate Education, in conjunction with Provost John Etchemendy, launched the DARE (Diversifying Academia, Recruiting Excellence) Doctoral Fellowship Program. DARE awards two-year fellowships to graduate students seeking academic careers. In addition to financial support DARE provides mentoring, seminars and network opportunities for students selected to this program. It fosters a community of women and minority students committed to future academic careers.

On September 30th I had the opportunity to attend the reception for new DARE Fellows and to listen to the reports from 16 graduate students participating in this program. The impact DARE has had on each of them both professionally and personally was moving and gratifying and affirms the value of networking, mentorship and career development. Among the presenters were two bioscience graduate students: Antonio Gomez from Microbiology and Immunology and Jose Morillo Prado from Developmental Biology. Each described how their DARE program experience is having an impact on the career pathway they plan to pursue. I was impressed and am appreciative of Vice Provost Gumpert and Provost Etchemendy for this novel program.

Information Resources and Technology Security Day

If you are like me, hardly a day goes by without some email message trying to get access to personal information. We have become used to the phishing expeditions but there are a lot of security challenges we are unaware of and thus potentially vulnerable to. Given that many in the medical school are engaged in human subjects research or patient care, our risks are among the highest anywhere. Information Resources and Technology (IRT) will be holding the first School of Medicine Information Security Day on Wednesday, November 3rd, 10:30 am - 2:30 pm, in LKSC lecture hall LK130. The day's program includes a demonstration on how to secure your iPhones and iPads, a talk on staying cyber-secure in the office and at home, and a keynote presentation at 11:00 am, "Anatomy of a Hospital Break-in," examining how a hacker can use a phishing email to climb his way up through a computer system until patient information is compromised.

IRT Information Security Services is dedicated to helping and educating students, faculty, and staff regarding information security. We hope you will find Information Security Day to be useful, informative, and fun. Please join us on November 3rd. To register or for more information, visit: <http://med.stanford.edu/irt/security/isd.html>. I certainly encourage you to attend.

Upcoming Events

Reception - New Exhibit in the History of Neurosurgery at Stanford

Friday, October 29

3:00 pm

Lane Library

The Department of Neurosurgery at the Stanford University School of Medicine has distinguished itself in clinical care and research in neuro-oncology, pediatric neurosurgery, stem cell research, and many other areas. But did you know that teaching and training in neurosurgery at Stanford can be traced back to San Francisco in the 1890s at Cooper Medical College, the predecessor institution to Stanford's School of Medicine?

The Stanford Medical History Center and Lane Medical Library are proud to present an original exhibit on the history of neurosurgery at Stanford. The exhibit is now on display on the first floor of Lane Medical Library, near the main entrance. This is the first in a new series of exhibits on

the history of the Departments and programs in the Stanford University School of Medicine that will be featured in Lane Library.

Dr. Gary Steinberg, Chair of the Department of Neurosurgery, will speak at a reception at the exhibit on Friday, October 29 at 3:00 p.m. For more information about the reception or the exhibit, please contact Drew Bourn, Curator at the Stanford Medical History Center in Lane Library, at dbourn@stanford.edu or (650) 725-8045.

The Office of Diversity and Leadership Welcomes Dr. Molly Carnes as 2010 Distinguished Lecturer

Plenary Talk: "Gender Equity in Academic Medicine and Science: Time for Institutional Change"

Thursday, October 21st

4:00 - 6:00pm

LKSC 2nd Floor Conference Center

Reception following

Event Registration: <https://www.onlineregistrationcenter.com/register.asp?m=275&c=1>

The Stanford community is delighted to welcome Dr. Molly Carnes, Jean Manchester Biddick Professor of Women's Health Research, and Department of Medicine from the University of Wisconsin on October 20-22nd, 2010. Dr. Carnes is nationally recognized for her scholarship in advancing women in science and academic medicine, having served as the Co-principle investigator for the NSF ADVANCE program at the University of Wisconsin.

In her talk Dr. Carnes will describe the pervasive existence of implicit bias that emerges from societal stereotypes about men and women, and how this bias is reflected in academic medicine and science. The event is hosted by The Office of Diversity and Leadership at the School of Medicine, The Clayman Institute for Gender Research, The Faculty Women's Forum and the Office of Faculty Development and Diversity. This event is open to all students, trainees, and faculty from the main campus and SOM.

Awards and Honors

- The Institute of Medicine of the National Academy of Sciences announced the election of 65 new distinguished members at its annual meeting today, October 11th. As stated by Dr. Harvey Fineberg, President of the IOM, "Each of these new members stands out as a professional whose research, knowledge, and skills have significantly advanced health and medicine and who has served as a model for others." I am proud to say that two Stanford faculty are counted among those newly elected. They are:
 - ***Karl Deisseroth***, MD, PhD, Associate Professor, Department of Bioengineering and Psychiatry
 - ***Steve Galli***, MD, Professor and Chair of the Department of Pathology.

Please join us in congratulating Drs. Deisseroth and Galli, whose election brings the number of Stanford faculty who are members of the IOM to 61. Currently the IOM has 1649 active members, and Stanford is well represented in its ranks, particularly given our faculty size compared to our peer institutions.

- **Kathleen Thompson**, Director of the Research Management Group, has been named the recipient of the 2010 Marsh O'Neill Award, which is awarded for "exceptional and enduring support of Stanford University's Research Enterprise. This prestigious award was inspired by the extraordinary career of Marsh O'Neill, Associate Director of the WW Hansen Laboratories, 1952-1990. Ms Thompson is highly respected by faculty and leaders in research and we all celebrate her award. Please join me in congratulating Ms Thompson.
- **Robert L. Dodd**, MD, PhD, Assistant Professor of Neurosurgery and Radiology, has been awarded the 2010 Denise O'Leary award winner for clinical Excellence by the board of Directors of Stanford Hospital and Clinics (SHC). He received the award in recognition of his outstanding contributions to the care of patients with brain tumors and cerebrovascular disorders that can result in stroke, and his long-standing commitment to clinical research, teaching, and community outreach.

Appointments and Promotions

Norman Freed has been promoted to Adjunct Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 6/01/10.

Susan Garay has been promoted to Adjunct Clinical Assistant Professor of Medicine, effective 6/01/10.

Janice Janas has been promoted to Adjunct Clinical Assistant Professor of Otolaryngology-Head and Neck Surgery, effective 10/01/10.

Yahli Lorch has been reappointed to Associate Professor (Research) of Structural Biology, effective 11/01/10.

Bruce M. MacIver has been promoted to Professor (Research) of Anesthesia, effective 10/01/10.

Janesta Noland has been promoted to Adjunct Clinical Assistant Professor of Pediatrics, effective 7/01/10.

Gavin J. Sherlock has been appointed to Associate Professor of Genetics, effective 10/01/10.

Betsy Strong has been promoted to Adjunct Clinical Assistant Professor of Medicine, effective 6/01/10.

Dean's Newsletter

October 25, 2010

A Discussion on The Future of Medicine and Healthcare: Some Personal Reflections

On October 16th I participated in a *Presidential Colloquium on the Great Challenges of the 21st Century* at my medical school alma mater, the University of Rochester. Because 2010 is also my 40th year since graduation (no comments necessary), the Colloquium offered me an opportunity to review, through my own personal lens, some of the tremendous changes that have occurred in science and medicine and to reflect on what they might mean for the future of health care. Dr. Hugo Sonnenshein, President Emeritus and Adam Smith Distinguished Service Professor at the University of Chicago, served as the moderator of the Colloquium. Other discussants included Steve Goldstein, CEO of Strong Memorial Hospital, and Dr. Sanjay Gupta, Chief Correspondent for Health and Medicine at CNN.

A longitudinal perspective provides the chance to weave together some of both the positive and the negative events that inform us where we are today and to offer insights about some of the challenges and opportunities that lie ahead. The parallel and intersecting aspects of science and medicine are notable; considerable growth has occurred in the biomedical research enterprise as well as the medical care establishment since I entered medical school. Together they have shaped the medicine we deliver today and have helped define the academic medical centers where we carry out our work.

On the positive side, the public investment in science and medicine has placed the United States at the acme of global excellence. Central to this achievement has been the continuous funding of biomedical research, particularly by the National Institutes of Health and the National Science Foundation, along with other federal and state agencies, private foundations, industry and philanthropic support. Even though we have seen, in both the last decade and the current one, large positive and negative swings in the funding levels (as measured against inflation), the size of the biomedical workforce has grown (as have many academic medical centers) and the pace of innovation and discovery has been startling and not infrequently breathtaking.

Because the expectations for the pace of medical advances by the public (and public funders) exceed the timeline required for discovery to reach maturation or application, it is easy to lose sight of how much progress has been made and what this signals for our future. Scientific discoveries can seem unconnected until one insight frames another in a new light, or lays the groundwork for a new understanding or scientific advance that sometimes makes sense only in retrospect. But the global leadership of the USA in scientific innovation and discovery is unquestioned – even with the increasing (and welcome) competition in basic research from centers throughout the world.

In contrast, as our excellence in science accelerated and yielded major payoffs during the past decades, a number of the outcomes of our investments in “healthcare” have been less salutary, despite the fact that the USA spends more on medical care than any other nation in the world. A fundamental issue is that we have lacked an organized healthcare system and have instead a patchwork quilt of public and private payers and not infrequently goals and objectives that can be perversely aligned between payers, providers and patients. Ironically, some of the very technologies and discoveries that have been developed to improve healthcare also drive up its cost— and some create distance and even barriers between patient and doctor.

While the Affordable Care Act (ACA) of 2010 seeks to remedy the ailments afflicting our healthcare system, most agree that it is just a beginning - and an expensive one at that. Cost control and a reformation of healthcare delivery are yet to come, but progress in these important areas is impacted by the economic downturn and the strong political sentiments and viewpoints governing public debate and discourse about the economy, our nation’s health and healthcare itself. The cost of healthcare is at the heart of the matter, but this is an issue that is seen differently by doctors, nurses and other professionals as well as by hospitals, insurers, industry, government and of course the public. Ultimately, controlling the cost of healthcare and reforming our delivery system will require everyone’s engagement – which seems destined to evolve slowly and painfully. But changes are necessary.

Not surprisingly, my prescription for change includes continued investment in innovation and discovery – although I would include innovation in healthcare delivery as an important accompaniment to innovations in science and medicine. Also not surprisingly, I view academic medical centers as playing a key role in these transformations – a view based on my own personal historical reckoning. During my presentation in Rochester, I gave a handful of examples— clearly only a microcosmic and personal view of the many macrocosmic changes that have occurred and that lie ahead.

- I recalled the incredible impact on me as a first year medical student when my preceptor, a pediatric hematologist-oncologist, took me to see one of his patients with newly diagnosed acute leukemia. I well recall my initial reaction to this incredibly ill child and my inability to comprehend how a physician could care for dying children. Of course I didn’t recognize during those seminal moments that my subsequent career of four decades would focus on childhood cancer and that I would be witness to discoveries and innovations by physicians and scientists that transformed this incurable disease into a treatable one. *I learned a number of additional lessons from this experience, including how cooperation and collaboration of teams of physicians, nurses, social workers and other professionals could form interdisciplinary teams to provide comprehensive care. I also learned that even complex care could be organized and guided by clinical protocols that improved treatment outcomes and permitted continued longitudinal learning. And, I learned the important connection between the care providers, child and family in the continuum of life and death. These lessons offer important ways to think about future healthcare delivery.*
- I recounted my first day of internship at the Children’s Hospital Boston, when I attended a two-year old child with bacterial meningitis that, despite antibiotic therapy, had resulted

in significant neurologic consequences for this previously healthy child. Fortunately, one of my early mentors was deeply engaged in developing a vaccine that would eventually prevent nearly all cases of *Hemophilus influenza* meningitis and that would also provide insights for developing other important vaccines as well. *Here the lesson is that research aimed at root cause and prevention can have major public health benefits. It is evidence of the patient commitment of physician-scientists to discover innovations that could transform the course of a devastating disease. Rather than simply seeking new antibiotics, this investigator was committed to finding ways to prevent rather than just treat. This also required important collaborations between academia and industry. It is also a lesson that research can take years and even decades to reach fruition and that deeply committed investigators cannot be deterred by failure or satisfied with just the achievement of short-term goals. These are all important lessons for the future.*

- I noted that during my medical and post-graduate education there was no mention or even awareness of the disease that would dominate my research life for many years while I was at the NIH. That is because new or previously unrecognized diseases can emerge, as was the case with the Human Immunodeficiency Virus and AIDS. *There are many lessons that were learned with this unique disease, including the incredible social stigma that accompanied its diagnosis and that still lingers today. Devastating illnesses can evoke fear and stigma as well as compassion and care. There can be little question that we have made incredible progress in treating HIV infection and in preventing its vertical transmission from mother to child. Of note, this progress was largely facilitated by basic science discoveries that had taken place more than a decade before HIV was first recognized in the early 1980s, and by investigators who did not anticipate HIV/AIDS *per se*.*

Specifically, the recognition of retroviruses and, in particular, the enzyme reverse transcriptase, proved critical in accelerating the quest for diagnostics and therapies for HIV. This fact underscores the importance of basic research whose impact may not be immediately discernible even while it sets the foundation for future discoveries. HIV/AIDS also points out how travel has impacted emerging infections and how our global community still suffers incredible disparity in access to treatments and discoveries. We are further witness to globally transmitted diseases today, such as influenza, and will undoubtedly continue to face new challenges in the years ahead.

- In some ways it is shocking – if not embarrassing – to admit that when I graduated from medical school, CT and MR scans had not yet become integral to the diagnostic imaging armamentarium. Over the ensuing decades these and other imaging technologies have transformed medical diagnosis and have led to tremendous progress in virtually every area of medicine – from diagnosis to treatment and prevention. But these rapidly changing technologies also pose a number of challenges. In addition to the promise that imaging technologies will move to the cellular and molecular level and technology, permitting opportunities for early diagnosis and intervention, the overuse of imaging and other technologies has also contributed to the rising costs of medical care. Imaging technologies have been the basis of competition among hospitals and providers, and they have sometimes negatively affected medical decision-making through overreliance on

tests as well as by inadvertently separating the doctor from the patient. *Although an important lesson is that technology can rapidly change the diagnostic landscape, it can also elevate costs and contribute to perverse incentives. A lesson going forward is the importance of critically assessing new technologies and employing them on data driven standards that promote quality of clinical care. Another lesson is the importance of sustaining and valuing the important connection between doctor and patient, which technology can inadvertently interrupt – with a loss in the perceived value of a relationship that innovation cannot replace.*

- I also commented on the fact that when I was a medical student the “genetic code” was just being unraveled. Indeed, a palpable anticipation abounded that the rapidly evolving new knowledge would unlock the mystery of life. But as has happened over and over again, each new scientific insight takes us another step closer to the complexity of life and opens new paths and cycles of inquiry, discovery - and further inquiry. We recall the fanfare that surrounded the sequencing of the human genome and the expectation (at least by the media) that the alphabet of life would spell out opportunities for new drugs, diagnostics and treatments. While some of this has occurred and there is every reason to believe that over time major benefits will unfold, meeting public expectations always takes longer than initially anticipated. Looking back over the revolution in molecular biology that has unfolded in the last decades, the discoveries and their application to medicine have been truly awe inspiring – certainly when viewed with perspective. *But a constant lesson is how the hype of discovery, even if unintended, can raise and then dash public expectation and ultimately its support. There is a constant and nearly unquenchable thirst for news about science and medicine. There is also confusion, disenchantment and cynicism when promises exceed the timeline of reality. This is a road we seem to travel over and over again – whether it be in the utility of genomic testing to predict disease, or the prospect that stem cells will help correct or repair diseased organs or tissues.*

I certainly believe that over time these discoveries will have a revolutionary impact on our approach to early diagnosis and prediction of risk, disease management, therapeutics and beyond. But it is important that we balance the risks and benefits of new discoveries and avoid a rush to commercialization or over-utilization that is not grounded in science and evidence. For example, as the prospect for full genome testing and genotyping become increasingly less expensive and more abundantly available, we need to assure responsible management of public expectation. This is a forum in which academic medical centers can play a particularly important role – whether it is in defining the appropriateness of genotyping, the prospect for regenerative medicine, or the myriad of other discoveries and innovations that will unfold in the years ahead.

These are just a small handful of personal examples. Countless others can be added and many readers will have personal reflections that extend well beyond my own. But the lessons are also clear. While innovation and discovery will shape the future of medicine, it is also important to rekindle, remember and re-introduce some of the lessons of the past, especially around the quality of the doctor-patient relationship.

I was fortunate as a medical student to be at a school that valued and championed the so-called biopsychosocial model and that focused on teaching students the art of listening to patients, taking careful medical histories in an open-ended fashion, and in carefully using the physical exam to extend medical diagnosis. I recognize that there were many technologies and tools that we lacked at that time – but ironically it was their absence that mandated more attention to listening, observing and directly interacting with patients. Of course there was also more time to do so, since the business of medicine was not yet in place.

I have spoken previously and written not infrequently about the importance of reconnecting science and innovation with humanism and professionalism. These attributes are all the more important as we face the soon to be rapidly changing landscape of healthcare – particularly given the response of the public and private sectors to the Affordable Care Act (ACA) and also the impact of declining funds for biomedical research from the NIH over the years ahead. Both of these factors have serious implications for academic medical centers – which, while only a small part of the medical enterprise, are the font of educating future students and trainees as well as in leading innovation and discovery and translating their findings into improving patient care. As I have previously highlighted, academic medical centers, along with other care systems, will be judged by the communities they serve on whether they are seen and valued as centers of innovation and discovery, are providers of outstanding state-of-the-art patient care, offer the highest quality and safety, provide outstanding patient services and give evidence of cost-effective and value-added care. At Stanford we do well in some of these attributes but not in all. Going forward we will need to perform superbly in each and will need to have evidence of continuous improvement over time.

It is likely the impact of the ACA will be expressed differently in various parts of the USA. The challenges will vary for different communities and, while some governing principles and complexities will be constant, individual adaptation will be essential. Clearly we can't simply react to the changes that will occur – we need to anticipate them and in fact lead them. We can of course learn from other peers and communities, but, in the end, we will need to chart our own unique course. This includes recognizing the very consolidated healthcare market that already exists in the Bay Area, where we clearly need to provide differential value. It means creating networks of primary care providers who are linked to our specialty services and of training the individuals who will be the future providers and innovators of science and medicine. It means paying careful attention to the size and scope of our faculty and workforce; calibrating and reassessing our programmatic and capital investments (both on campus and off-campus); developing new partnerships with industry and insurers using different expectations and metrics; and strategically planning the alignment of our clinical services as well as how they benefit from and contribute to innovation. And we need to consider novel ways of improving our healthcare delivery in a more team-based, protocol driven, evidence-based and value-added fashion.

I previously highlighted Atul Gawande's commentary on healthcare in his June 2010 New Yorker article entitled The Cost Conundrum (see: http://www.newyorker.com/reporting/2009/06/01/090601fa_fact_gawande). His work and that of numerous others point to examples around the country where lessons can be learned about the organization of medical care. The health care system in Grand Junction, Colorado has been cited as one example of lower cost and higher quality. While the conditions are radically different,

some of the principles that have been put into practice there are worth highlighting, as was done by a Perspective by Thomas Bodenheimer and David West entitled “Low-Cost Lessons from Grand Junction, Colorado in the October 7, 2010 New England Journal of Medicine (<http://www.nejm.org/doi/full/10.1056/NEJMp1008450>). As noted by Bodenheimer and West: *“We believe that seven interrelated features of the health care system that may explain the relatively low health care costs could be adopted elsewhere. These are leadership by the primary care community; a payment system involving risk sharing by physicians; equalization of physician payment for the care of Medicare, Medicaid, and privately insured patients; regionalization of services into an orderly system of primary, secondary, and tertiary care; limits on the supply of expensive resources, including specialists, beds, and equipment; payment of primary care physicians for hospital visits; and robust end-of-life care. These features could be replicated in other markets — though generally not without political battles.”*

Even though many of the features of the ACA won’t unfold for years, many observers note that changes are already underway and that they are unlikely to be influenced by potential changes in the Congressional House and Senate in the upcoming midterm elections. They stand as reminders to take responsible leadership now as we work to shape and reshape the future of Stanford Medicine.

Leadership Matters

On Tuesday, October 19th I had the opportunity to participate in one of the “Fireside Sessions” of the Medical Leadership Development course, which is now in its third year. This year the course directors are Vitelio Rodriguez (SMS2), Takudzwa Shumba (SMS2), Matthew Goldstein (SMS6+) and Robin Eisenhut (SMS3). Ms Julia Tussing, Associate Dean for Educational Programs and Services, serves as the course Facilitator and Dr. Charles Prober, Senior Associate Dean for Medical Education, is the Faculty Director. The course (PEDS 201) includes six fireside chats with selected leaders who share their personal journeys and lessons learned along with six skill workshops that address topics like “What is Leadership?,” “Influence,” “Communication and Emotional Intelligence,” “Conflict Management,” “Self-Knowledge” and “Teams.” There are relevant readings and discussion groups – all aimed at introducing “fundamentals of effective leadership in the exciting and dynamic environment of health care. The primary objective of this curriculum is to provide students and residents with a theoretical and functional knowledge of leadership through participation in activities of self-discovery and leadership immersion.”

I was pleased to be part of this course and also deeply appreciative of the leadership of our students in organizing this year’s course, as well as those run previously by medical and graduate students. These programs help shape our future leaders – one of our primary goals and objectives in the medical school. These programs are complemented nicely by additional courses run by the Office of Diversity and Leadership under the leadership of Dr. Hannah Valentine, including the popular and highly successful “Faculty Fellows” program. Programs for leadership development are also offered by Stanford Hospital and Clinics and the Lucile Packard Children’s Hospital at Stanford.

The University also has several leadership development and networking programs, three of which include participation of faculty and staff from throughout the university. This year several School of Medicine faculty and staff as well as staff from Stanford Hospital and Clinics and Lucile Packard Children's Hospital have been selected for one of these three programs, including:

- **The Stanford Leadership Academy:**

- *Douglas W. Blayney*, Ann & John Doerr Medical Director-Stanford Cancer Center and Acting Professor of Medicine and Oncology, Stanford Hospital and Clinics
- *Timothy Carmack*, Chief Financial Officer, Lucile Packard Children's Hospital
- *Edward Kopetsky*, Chief Information Officer, Lucile Packard Children's Hospital
- *Beverly S. Mitchell*, George E. Becker Professor in Medicine and Professor, by courtesy, of Chemical and Systems Biology, School of Medicine
- *Kim Pardini-Kiely*, Vice President for Quality and Clinical Effectiveness, Stanford Hospital and Clinics

- **The Stanford Fellows:**

- *Renee Pera*, Professor of Obstetrics and Gynecology, School of Medicine
- *Tom Rando*, Deputy Director-Stanford Center on Longevity and Professor-Neurology and Neurological Sciences, School of Medicine (Continuing for a second year)

- **Leadership@Stanford**

- *Heidi Heilemann*, Associate Dean for Knowledge Management and Director of Lane Medical Library, School of Medicine
- *David O'Brien*, Director-Office of Institutional Planning, School of Medicine

Clearly these various programs give evidence of the commitment of the School, Medical Center and University to leadership development and training. These programs help with acquisition of new skills as well as opportunities for interaction and networking across the campus – all of which should hold Stanford in good stead over the challenging years ahead.

Some Thanks for the Visit by His Holiness the Dalai Lama

On October 14-15th, His Holiness the Dalai Lama returned to Stanford after five years to participate in three public events on the theme of “Compassion, Science and Society.” On the morning of the 14th he was welcomed in Maples Pavilion by President Hennessy before speaking to an audience of over 6,000 on the subject of “The Centrality of Compassion in Human Life and Society.” That afternoon he spoke to 1200 students at Memorial Church as the Rathbun Visiting Fellow, where he gave this year's “Harry's Last Lecture on a Meaningful Life.” The next day he took part in an all day conference at Memorial Auditorium on the “Scientific Explorations of Compassion and Altruism.” Over 1600 people heard reports by neuroscientists, psychologists and educators as well as the Dalai Lama's comments, questions, and dialogue with the presenters. Thursday's events are described in greater detail in this Stanford Reports story: <http://news.stanford.edu/news/2010/october/dalai-lama-speaks-101410.html>. The conference is well summarized on the School of Medicine's blog (<http://scopeblog.stanford.edu/archives/2010/10/dalai-lama-and.html>). By every account this was a highly appreciated and successful visit.

These events required many months of planning by numerous individual throughout the University. I want to begin by thanking Dr. Jim Doty, Director of the Center for Compassion and Altruism Research and Education (CCARE: <http://ccare.stanford.edu/>), and Dr. Gary Steinberg, Director of the Stanford Institute for Neuro-Innovation and Translational Neuroscience, for leading the effort to bring the Dalai Lama back to Stanford. I also want to thank the Reverend Scotty McClennan, Dean for Religious Life, and his office for their incredible engagement. Ms. Elaine Enos, Executive Director of Stanford Events, worked tirelessly to coordinate the incredible array of issues needed for a “head of state” visit. In the medical school I want to extend my deepest thanks to Dr. Kathy Gillam, Senior Advisor to the Dean, and Ms. Kristin Goldthorpe, Project Manager in the Dean’s Office. Their contributions were incredible and helped contribute to the success of the visit.

Advocacy and Research

At each meeting of the Independent Citizens Oversight Committee (ICOC), the governing board for the California Institute of Regenerative Medicine (CIRM), a public scientific and patient advocacy presentation is given. This helps educate the ICOC as well as give purpose to its work in overseeing the nation’s largest program in stem cell biology and regenerative medicine. I have been an appointed member of the ICOC since 2004 and have attended hundreds of meetings over the years. I was particularly touched by the presentation that took place on October 21st in Los Angeles on the topic of Neuromyelitis Optica (NMO). This is a rare disease, but it has devastating consequences for those affected by its major manifestations of blindness and paralysis. Like many orphan diseases, there is often a paucity of investigators and a lack of funding. That was clearly the case for NMO until a small number of parents became advocates and created a foundation to bring investigators together, support their research and help move the agenda forward. The Guthy-Jackson Charitable Foundation was created by parents Bill Guthy and Victoria Jackson (www.guthyjacksonfoundation.org) and has had an impressive impact.

This is a story told over and over again. I remember it well from the early days of Pediatric AIDS when the Elisabeth Glaser Pediatric AIDS Foundation was created to promote research and bring investigators from different fields to focus on a new and challenging problem. There is no question that patient advocacy has helped shape our research agendas and has created alignments between patients, parents, scientists, physicians and public and private funders. I have tremendous respect for each of these programs and what they have been able to accomplish. I only wish we didn’t need to learn the lesson over and over again. The need to bring researchers together from different institutions to focus attention and effort on new (or even old) diseases is something we should clearly understand. Ironically, each new effort seems to recreate past insights and demonstrate the important connection between those impacted by serious illness with those who have the potential to impact its clinical course.

I once tried to address this need by establishing a more generic research network to be ready and able to tackle new problems as they arose by aligning major children’s research programs. This was the Glaser Pediatric Research Network – but in the absence of specific disease advocates there was no ready way to sustain the infrastructure needed to keep the network active. Thus we seem destined to have to create and recreate specific efforts. Even so, as they arise they are

meaningful and important – as was the experience of the Guthy-Jackson Foundation noted above.

Major Appointments

I am pleased to announce two major faculty appointments to important leadership programs in the School of Medicine:

- **Dr. Mark Krasnow**, Professor and Chair of the Department of Biochemistry and Investigator in the Howard Hughes Medical Institute, will serve as the Executive Director of the Vera Moulton Wall Center (<http://wallcenter.stanford.edu/>). In this capacity he will oversee the Center's research programs and help align them to the clinical programs led by Dr. Jeff Feinstein, Associate Professor of Pediatrics. The Wall Center is now part of the Cardiovascular Institute at Stanford.
- **Dr. Mike Longaker**, the Deane P. and Louise Mitchell Professor and, by courtesy, Professor of Bioengineering and of Materials Science and Engineering, has been named the Co-Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine. In this capacity he helps shape the Institute's efforts in translational medicine and discovery. Dr. Longaker is also the Director of the Program in Regenerative Medicine. He was named Vice Chair of the Department of Surgery this past June and also serves as the Director of the University-wide Initiative on Human Health.

Please join me in thanking and congratulating Drs. Krasnow and Longaker for their willingness to serve in additional leadership positions. We are fortunate to have them in these roles.

The Fall Issue of Stanford Magazine Is Available

The Fall issue of Stanford Magazine has just been released and is on its way to readers now. It is also online at <http://stanmed.stanford.edu>. The theme of this issue is "The 'me' in medicine – personalizing treatments." The lead piece is a feature about the use of genome analysis to uncover the cause of a teenager's sudden death — a story revealing the practical and ethical challenges of whole-genome sequencing. There is also a story on gene-targeted treatment for triple-negative breast cancer and an article that looks beyond genes to describe a newly discovered type of molecule - called lincRNA - that tells our genes what to do. The issue also has a piece on the Genomics and Personalized Medicine course offered last summer that includes comment from the faculty and students who participated in the class. I have previously commented on the issues surrounding the question of whether students should be given the opportunity to have their genotypes analyzed (http://deansnewsletter.stanford.edu/archive/09_28_09.html), and I was pleased to see this thoughtful article. Congratulations to Rosanne Spector, Editor, and all those who worked on this edition, for another excellent issue of Stanford Magazine.

Rathmann Family Foundation E4C Faculty Fellowship in Patient-Centered Care

The Stanford School of Medicine Office of Medical Education is pleased to announce the **Rathmann Family Foundation Educators-4-CARE (E4C) Fellowship in Patient-Centered Care**. This program will provide the part-time salary support for a Stanford faculty, fellow, or chief resident to pursue further study and activities focused on the promotion of patient-centered care in medical education. Areas of focus may include instructional design, curriculum development, or evaluation. Alternatively individuals may have topical areas of focus, such as clinical skills, compassion and humanism, or professionalism.

The program will provide funding for protected time for one year to support directed readings under the supervision of the faculty directors of the program, participation in ongoing curriculum development in undergraduate medical education in the area of patient-centered care, and development and conduct of a scholarly project in medical education related to patient-centered care. The fellow will participate in the Educators-4-C.A.R.E. (E4C) program, serving as a mentored preceptor with selected E4C faculty in educational activities that are part of the E4C program.

The program will provide \$50,000 in salary support for one year, plus up to \$5,000 in project support for the fellow's project.

Interested individuals should submit the attached application, CV, and cover letter **by Friday, December 17, 2010** to:

Clarence H. Braddock III, MD, MPH, FACP
Professor of Medicine and Associate Dean, Medical Education
Office of Medical Education
Stanford School of Medicine
251 Campus Dr., MC 5404
Stanford, CA 94305-5404
E-mail: [cbrad at stanford dot edu](mailto:cbrad@stanford.edu)

Upcoming Events

United Nations Film Festival

Wednesday, October 27th

4:00 pm

Li Ka Shing Center

Free admission

The United Nations Association Film Festival (UNAFF) will, for the first time, show screening of three films at Stanford Medical School's state-of-the-art Li Ka Shing medical school building, a natural home to the themes of health and human rights that are a common thread in these films. From the voices of former child slaves in Sudan, to the plea of a mother determined to protect her daughter from the dangers of genital cutting, to the travels of a retired man who bikes 20 km each day to bring AIDS treatment to his community, these three films are a testament to the power of human will and determination.

At 5:45 pm there will be a discussion panel with Stanford faculty, followed by a reception with the filmmakers at 7:00 pm. For more information please contact Shah Ali at shahali@stanford.edu.

Reception: New Exhibit in the History of Neurosurgery at Stanford

Friday, October 29

3:00 pm

Lane Library

The Department of Neurosurgery at the Stanford University School of Medicine has distinguished itself in clinical care and research in neuro-oncology, pediatric neurosurgery, stem cell research, and many other areas. But did you know that teaching and training in neurosurgery at Stanford can be traced back to San Francisco in the 1890s at Cooper Medical College, the predecessor institution to Stanford's School of Medicine?

The Stanford Medical History Center and Lane Medical Library are proud to present an original exhibit on the history of neurosurgery at Stanford. The exhibit is now on display on the first floor of Lane Medical Library, near the main entrance. This is the first in a new series of exhibits on the history of the Departments and programs in the Stanford University School of Medicine that will be featured in Lane Library.

Dr. Gary Steinberg, Chair of the Department of Neurosurgery, will speak at a reception at the exhibit on Friday, October 29 at 3:00 p.m. For more information about the reception or the exhibit, please contact Drew Bourn, Curator at the Stanford Medical History Center in Lane Library, at dbourn@stanford.edu or (650) 725-8045.

Awards and Honors

- **Dr. Hannah Valentine**, Senior Associate Dean for Diversity and Leadership and Professor of Medicine, is the recipient of one of six Pathfinder Awards recently announced by the NIH to support innovative approaches to increasing diversity in the nation's scientific workforce (see: <http://med.stanford.edu/ism/2010/october/diversity.html>). Dr. Valentine will receive \$2 million over three years to explore ways of helping female faculty overcome "stereotype threat" that could impact their career development. This is an extremely important issue, and Dr. Valentine is playing an increasingly significant role in advancing this field – and helping our faculty. Please join me in congratulating Dr. Valentine.
- **Dr. Carlos Bustamante**, Professor in the Department of Genetics, was named a MacArthur Fellow on September 27th (see: <http://med.stanford.edu/ism/2010/september/bustamante.html>). Because of the timing of the announcement, I did not get to congratulate him in the DNL and want to take this opportunity to do so. This is a wonderful accomplishment. Dr. Bustamante joins Drs. Per Harbury and Julie Theriot, both in the Department of Biochemistry, who were named MacArthur Fellows in 2005 and 2004 respectively. Congratulations to Dr. Bustamante.

- **Dr. Tom Krummel**, the Emile Holman Professor and Chair of the Department of Surgery and the Susan B. Ford Surgeon-in-Chief at the Lucile Packard Children's Hospital, was elected the President of James IV Association of Surgeons, which was founded in 1957 to develop closer ties between surgeons and to sponsor visiting fellowships for outstanding young surgeons. Congratulations to Dr. Krummel.

Appointments and Promotions

Maria D. Allo has been reappointed as Clinical Professor (Affiliated) of Surgery, effective 9/1/2010.

Douglas Blayney has been appointed to Professor of Medicine at the Stanford University Medical Center, effective 10/01/10.

Michelle T. Cao has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 10/16/2010.

Jeffrey Chi has been promoted to Clinical Assistant Professor of Medicine, effective 10/1/2010.

Kathleen M. Corcoran has been appointed as Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 11/1/2010.

Melanie R. De Guzman has been appointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2010.

Cynthia L. Detata has been reappointed as Clinical Assistant Professor of Obstetrics and Gynecology, effective 9/1/2010.

Manuel Garcia-Careaga has been reappointed as Clinical Professor of Pediatrics, effective 4/1/2010.

David R. Drover has been reappointed to Associate Professor of Anesthesia at the Stanford University Medical Center, effective 11/01/10.

Robert M. Holaway has been appointed as Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 10/16/2010.

Frederick Hopkins has been appointed as Clinical Associate Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2010.

Nasha Nasim Sabery Khavari has been appointed as Clinical Assistant Professor of Pediatrics, effective 11/1/2010.

Tzielan Lee has been promoted to Clinical Associate Professor of Pediatrics, effective 10/16/2010.

Hau Liu has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2010.

Deirdre J. Lyell has been promoted to Associate Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 10/01/10.

Friedrich Moritz has been reappointed as Clinical Assistant Professor (Affiliated) of Anesthesia, effective 9/1/2010.

Mary E. Norton has been appointed to Professor of Obstetrics and Gynecology and, by courtesy, of Pediatrics, at the Stanford University Medical Center, effective 10/01/10.

Jongsoo Park has been promoted to Associate Professor of Neurosurgery at the Stanford University Medical Center, effective 10/01/10.

Donald Schreiber has been reappointed to Associate Professor of Surgery at the Stanford University Medical Center, effective 11/01/10.

Paul J. Sharek has been promoted to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 10/01/10.

Nayan Sivamurthy has been reappointed as Clinical Assistant Professor (Affiliated) of Surgery, effective 2/1/2010.

Shannon S. Sullivan has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences effective 10/16/2010.

Noushafarin Taleghani has been promoted to Clinical Associate Professor of Surgery, effective 9/1/2010.

Kimberly Valenta has been promoted to Clinical Assistant Professor of Anesthesia, effective 11/1/2010.

Volney Van Dalsem III has been reappointed as Clinical Associate Professor of Radiology, effective 9/1/2010.

Nancy Ewen Wang has been promoted to Associate Professor of Surgery at the Stanford University Medical Center, effective 10/01/10.

Lynn M. Westphal has been reappointed to Associate Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 3/01/11.

Sang Hoon (Jonathan) Woo has been promoted to Clinical Assistant Professor of Medicine, effective 10/1/2010.

Dean's Newsletter

November 8, 2010

The Importance of Service to the Community

I readily admit that when I think about the missions of Stanford School of Medicine my mind is drawn to our individual and collective work in education, research and patient care. But when I step back for a moment, it is readily apparent that we do this work to benefit our community, locally and globally. Moreover, whatever social value our academic medical center accrues is a reflection of how our efforts and contributions are perceived by the communities we serve. They validate our contributions and we endeavor to improve their well-being.

With that mindset and spirit I was pleased to attend the 9th Annual Community Health Symposium, which was a collaborative effort between the Office of Community Health and students and faculty. Special thanks for this year's symposium go to Nayna Lodhia, SMS II and Vibha Mahendral, SMS II along with Ann Banchroff, MSW, MPH; Jill Evans, MPH; Wendy Everett; Evelyn Ho, MPH; Rhonda McClinton-Brown, MPH; and Marilyn Winkleby, PhD, MPH.

I was extremely pleased and gratified by the attendance of students, staff, faculty and community partners who shared ideas, reflections and accomplishments. Many of the contributions were codified in more than 30 posters prepared by students that covered a wide array of topics and issues. These were coupled with a series of oral presentations and lots of discussion.

I sometimes hear it said that our efforts in research and education are at odds with our community efforts. I am always surprised by that perception since to me each is a very vital and important part of what medicine and science stand for – the discovery of new knowledge and the search for ways to utilize innovation and discovery to improve the health of our communities.

The Road to the Lorry Lokey Stem Cell Research Building

Over the past couple of weeks we have had the extraordinary opportunity to dedicate the Li Ka Shing Center for Learning and Knowledge and the Lorry Lokey Stem Cell Research Building (Stanford Institutes of Medicine 1). These two marvelous new buildings, along with their connecting walks and paths, constitute the new face of the School of Medicine, and bring new harmony and architectural integrity to the medical school. As these wonderful facilities now become part of our familiar landscape, it is worth noting that their design and construction defied most predictions, including the amount of money raised, the incredible partnerships that were developed and the pace of transformative construction. As is often the case in projects of this size and scope, a number of critical factors had to come together at just the right time. And a number of key individuals had to be engaged and committed to collaboration and shared success. This was equally true of the Li Ka Shing Center for Learning and Knowledge, about which I wrote in an earlier Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/10_11_10.html#1), and the Lorry Lokey Stem Cell research Building.

Needless to say, the Lorry Lokey Stem Cell Research Building would not have been possible without the incredible gift from Mr. Lokey and the extraordinary funding from the California Institute for Regenerative Medicine (CIRM). Indeed these were closely linked events. The application for CIRM funding required intense interactions and collaborations between scientists and facilities leaders, since both were evaluated in the review process. The architectural design by ZGF and the facilities planning efforts of Niraj Dangoria, Assistant Dean for Facilities Planning and Management, Chris Shay, Facilities Engineer, and Lang Anh Pham, former Institute DFA, were critical to the CIRM proposal on the facilities side of the equation, as were those of Drs. Mike Longaker, Irv Weissman, Rene Reijo-Pera, Bev Mitchell and others on the scientific proposal.

The \$43.6 million construction grant from CIRM provided a critical piece to the puzzle but also raised fortuitous challenges and opportunities. The first was the need to complete the construction within two years of the time of the award. Secondly, with that timeline came the need to complete the funding (and fundraising) efforts so that construction could commence in the summer of 2008. Indeed, the funding from CIRM enabled me to make the case to Mr. Lokey for the need to increase the size of his gift in order to move this exceptional project forward. Those discussions occurred in Mr. Lokey's kitchen over a period of weeks and culminated with his pledge of \$75 million in September of 2008. Amazingly, this agreement was reached just weeks before the stock market plunge of October 2008. Thankfully, Mr. Lokey sustained his commitment – for which we are all deeply appreciative.

Funding was a key essential element to this project, but so too was cooperation among faculty to enable the design to proceed expeditiously and without tension or distraction. Many played important roles in this process, but most notable were the contributions and leaderships of Drs. Irv Weissman, Bev Mitchell, Mike Cleary, Mike Clark, Renee Reijo-Pera, Mike Longaker and Phil Beachy. We owe them, individually and collectively, a great vote of appreciation. While much of their work was behind the scenes, we now appreciate it every day in the excellence of the completed Lokey facility.

Because the timeline for construction was faster than anything of similar size and scope in Stanford's prior experience, seamless coordination of the multiple groups and constituencies within and outside the University was essential. First and foremost this included outstanding collaboration with the University's Office of Land & Buildings led by Bob Reidy with our School of Medicine Facilities team led by Niraj Dangoria and Chris Shay. The collaboration of University architect David Lenox with ZGF was essential, and we enjoyed a close and cooperative working relationship with the construction firm of Whiting and Turner. The projects were large in scope and complexity and benefited from new computer design technology and incredible people cooperation. Both were essential.

A final touch of elegance was celebrated this past week with the dedication of the Tre Stelle Di Lapislazzuli Chandelier designed by Dale Chihuly, which has transformed the atrium, entry and very face of the Lorry Lokey Stem Cell Research Building. This too was an incredible partnership and coincidence. It began with a discussion between Ms. Sue McCollum, the founder of My Blue Dots, with Irv Weismann at the groundbreaking event of the Lokey Building in 2008. Over the subsequent year(s), Ms McCollum and her husband Bob McCollum provided the

financial resources (along with family and friends) and the inspiration for the glass chandelier. Equally fortunately, the timing of the design permitted the building architects and construction team to prepare the site for installation of the multistory work of art. By combining art and science, creativity and vision, the Lokey Building truly stands as a beacon of hope and inspiration.

It is always amazing to observe how a wide array of seemingly unconnected people and events come together to create a transforming idea or facility. In the case of the Lorry Lokey Stem Cell Research Building, the result is a marriage of individual creativity with a facility that will foster further innovation and symbolize Stanford's commitment to research that improves human life and dignity. Thanks to all who have helped make this come to fruition.

Recommendations of the Teaching Excellence Task Force

Over the past several years we have had numerous discussions about the importance of our teaching mission and how to properly support it. In response to these discussions, I asked Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, and Dr. Charles Prober, Senior Associate Dean for Medical Education, to organize and convene a Teaching Excellence Task Force. This group was charged to develop recommendations on how teaching is measured, how it is supported and whether the necessary and appropriate incentives are in place to recognize outstanding teaching. The perceived and actual value assigned to teaching and education has been the topic of faculty pride as well as concern and sometimes consternation. Indeed, when faculty have been asked to comment on institutional mission priorities, they indicate that teaching and patient care are perceived as having a lower priority than research. The view that teaching performance is not assessed sufficiently or given sufficient weight in academic appointment and promotion is frequently expressed.

The Teaching Excellence Task Force addressed these and related perceptions. In addition to the Teaching Excellence Task Force itself (Chaired by Dr. Charles Prober with Members including Clarence Braddock, Heather Davidson, Nancy Morioka-Douglas, Cindy Irvine, John Pringle, Kelley Skeff, Stephen Smith, Elizabeth Stuart, Julia Tussing, Thomas Wandless, Sherry Wren), two subcommittees were also appointed. These included a "Teaching Evaluation and Awards Subcommittee" chaired by Dr. Clarence Braddock and a "Funds Flow Subcommittee" chaired by Julia Tussing. The various committees met from March 2009 – September 2010 and developed the recommendations that follow. These recommendations will be discussed at an upcoming Executive Committee, but I share them now in their current form in order to elicit reactions and comments from our community. Please share any comments you have with me or with Drs. Prober or Stevenson.

Draft Comments and Recommendations from the Teaching Excellence Task Force

1. Clearly define teaching activities.

We recommend that the School of Medicine develop a broad definition of teaching activities that "contribute to the educational mission" of the school and is integral to the appointments and promotions process.

- Amend the long form for tenure and promotion to include description and documentation of how this person has contributed to the educational mission of the school.
 - Develop explicit expectations for teaching responsibilities of faculty at the department level (recommendation #6 speaks to how these expectations may be conveyed and measured).
2. **Increase the visibility of teaching excellence across the School of Medicine.**
We recommend that the School regularly promote the expectation that teaching is important and a priority within both the clinical medicine and bioscience environments.
- Regularly highlight achievements and awards of teaching excellence in school-wide publications.
 - Work with Communications to promote stories of teaching excellence in on-line, school-wide and national publications.
3. **Develop an orientation for new faculty that focuses on teaching.**
We recommend that all new faculty to Stanford School of Medicine be provided with an "education orientation," including basic faculty development to promote their effectiveness as teachers.
 We have existing resources in the Stanford Faculty Development Center and University-based Center for Teaching and Learning that can be mobilized in this effort. Topics to be addressed would include the following:
- Mission of teaching in the School of Medicine
 - Explanation of teaching as a factor in the appointments and promotions process
 - Specific expectations for faculty contributions to the teaching mission
 - Core skills in teaching and core content in teaching and learning
 - Invitation to have one's teaching evaluated by peers (see below)
 - Set aside time for existing faculty at Stanford as well as the Palo Alto VA, Kaiser Santa Clara, and SCVMC to have the opportunity to participate in an "education orientation."
4. **Develop a program for peer evaluation of teaching.**
Peer evaluation of teaching would enhance the quality and quantity of formative feedback and professional development for faculty in their teaching role. We recommend the development of a pool of faculty who can offer voluntary peer observation and peer feedback on teaching.
 A cadre of faculty would be identified to serve as evaluators by virtue of their own level of attainment in teaching, as evidenced by their evaluations, teaching awards, and participation in faculty development programs. Being named to this group would be an honor/acknowledgement of these faculty's instructional achievements (the "master teacher" or Academy model). This group of faculty would need support in developing their skills in peer evaluation. Membership in the Academy would be based upon demonstrated excellence in teaching. Members of the Academy would accept the responsibility to participate in ongoing professional development as teachers, and to participate in peer evaluation and coaching of others.
- Develop adequate funding mechanisms for encouraging junior faculty to participate
5. **Develop policy on student and housestaff accountability for evaluation of faculty teaching.**

We recommend a school-wide policy that requires students and housestaff complete faculty and course evaluations of teaching.

In order to create a robust system for evaluation of individual faculty, we need to develop mechanisms to consistently gather data from students and housestaff. It is essential to create a culture in which evaluation of faculty is understood to be part of the same process by which students and housestaff seek feedback from faculty on their work; we must also help students understand the ways in which their feedback factors into the appointments and promotions process.

- Requiring completion of a certain percentage of evaluations to obtain a passing grade in a course (e.g. 80%) across all courses in the MD program.

Possible additional strategies in this regard include the following:

- Withhold credit for attendance at lectures unless evaluations are submitted (for those courses where lecture attendance is mandatory)
- Select a random sample of students to be evaluators for each class or lecture
- Promote professionalism among students as it relates to giving feedback (i.e., continuing efforts to orient/train students through such activities as the Doctors' Roundtable, creating a system in which student evaluations do not remain anonymous if professionalism is not maintained, etc.)
- Work with GME to integrate similar mechanisms into the housestaff evaluation process

6. Develop a standard method of collecting and reporting teaching activity to the appointment and promotion process.

We recommend that all teaching activity and reports on evaluation of teaching at all levels (e.g. medical student, residency) be compiled electronically into a portfolio for each faculty.

The data sources for this effort would be multiple, but include E*Value©, MedHub, EventApp, and others. The School should explore ways in which this evidence of the amount and evaluation of teaching could be captured and reported in a standard way, for use by the faculty member and his/her division chief of chair for annual feedback discussions, and by appointment and promotions committees at the appropriate intervals. We would envision that this system might work similarly to the Community Academic Profile, perhaps even becoming a component of that system.

7. Use NIH cap to determine Faculty salary support.

We recommend that salary support for all core faculty be based upon the NIH cap. We recognize that this effort may create a disincentive for senior faculty to serve. Efforts to re-examine the salary support scale need to take into consideration how to continue building in incentives for senior faculty participation.

8. Institute a formal review of courses to determine funding needs.

We recommend that the School institute a formal review of courses to determine whether the current distribution of funds is adequate and appropriate.

- An appointed committee should conduct a formal review of courses that acknowledge the course value, cost structure and potential for innovation in relation to the comprehensive curriculum.
- To evaluate a course's standing relative to the larger curriculum, a formal review should consider whether a) the core courses are adequately funded in the full

model, b) scrutinize elective courses to evaluate whether TECU allocation is warranted, and c) develop and advertise grant opportunities (see recommendation #10) to provide incentives for innovation that promotes more effective learning. If it is not appropriate for a course to receive TECU funding, a grant opportunity should be available to help the director develop a course with a submitted budget.

- *Current activities:* HHD and POM funding are being re-evaluated. The current budget for these courses is based on an amount that was established several years ago and has been inflated each year.

9. **Remodel the current method for funding teaching and administration of Clerkships.**

Current activities: Changes to the core clerkship funding model have been implemented for FY11. In order to address issues of transparency, inconsistent practices and a lack of adequate support for required clerkships, the Dean has approved a new model for funding clerkships. Rather than distribute TECUs for required clerkships to departments, only a standardized amount for faculty compensation (.4 FTE at the NIH cap) will be distributed. The remainder will be held in Educational Programs and Services and the department will charge to those accounts a standardized amount for Clerkship coordinators (.8 FTE at an average salary) and all non-compensation costs up to \$15,000. Costs in excess of this amount must be supported by the department, or in cases in which the expense is a required, extraordinary need, there is a small fund to which the clerkship can apply for funding. Additional administrative support to the clerkships will be supplied in the form of a half-time Administrator who will help to organize and optimize the activities of the clerkship coordinators.

10. **Provide internal grant opportunities for innovation in teaching.**

We recommend that the School set aside a pool of funds to offer seed grants for promoting innovation in teaching projects. Further discussion is needed to design a creative method for reserving funds and a process that would promote experimentation with new teaching technologies and pedagogy.

If you have comments or suggestions please send them to me (ppizzo@stanford.edu) or to Dr. Charles Prober (CProber@stanford.edu) or Dr. Stevenson (dstevenson@stanford.edu).

What Are Multiple Mini-Interviews?

Admission to medical school remains a daunting process for applicants and admissions committees. Our medical school receives nearly 6000 applicants each year for 86 places. Like in other medical schools, a number of factors are carefully considered in reviewing applicants, including academic readiness (GPA, MCAT), life experiences and personal qualities. Assessing personal qualities as a surrogate for professionalism and clinical competence is challenging and imperfect, and the traditional interview (as has been performed at Stanford) has considerable inter-rater variance and a relatively low predictive value for assessing clinical skills. Nor has the traditional interview been validated by strict metrics. In recent years behavioral interviewing techniques have been emerging, one of the more noteworthy examples being the “mini-multiple interview” (MMI) that has been pioneered at McMaster School of Medicine in Canada (the same school that brought forth problem-based learning a couple of decades ago). Based on the

experiences at McMaster and an increasing number of medical schools in the USA, members of our Admissions Committee and other senior education leaders at Stanford critically reviewed the MMI methodology and visited centers where it has been utilized. Based on a review of the literature, experience and observations, MMI will be employed this year at Stanford as an alternative to the traditional interview process.

Simply put, MMI includes short structured scenarios observed and scored by trained raters. Specifically, each candidate does 8-10 mini-interview scenarios in a two-hour session during which they move from one interview station to the next. The putative benefits of MMI include the fact that the interviews are structured and consistent for each applicant (which enhances fairness) and the fact that the process includes multiple scenarios and raters, which helps to minimize the potential bias of individual “interviewers.” In addition, the scenarios can be specifically designed to assess issues important to a specific school or setting (including ethical reasoning, critical reasoning and communication skills). Further, the interviews are not specifically knowledge based, and they expose the applicants to new scenarios that permit them to articulate their beliefs and judgments. And importantly, the rating scales are numeric and normalized, which permits the assessment to be quantitative.

Raters are trained and become knowledgeable in the specific scenario they oversee and rate. There is more than one rater per scenario – and the specific scenarios can include an applicant’s discussion of a topic or question (e.g., ethical dilemma), role-play scenarios and problem solving (including team problem solving). Here are some examples:

- **Example of a Teamwork Scenario:** Two applicants participate in a scenario in which one applicant is asked to perform a complex test (such as assembling or repairing a model) with the other applicant giving directions for dealing with or assembling the model. In this scenario the rater(s) observe the communication and teamwork of the applicant(s).
- **Example of an Ethical Decision Making Type Scenario:** The applicant is giving the following statement (as an example) to read over 2 minutes before entering the room.
“Recently in Congress, there has been a discussion concerning the issue of deterrent fees for all individuals on either Medicare or Medicaid (a small change, say \$20, which everyone who initiates a visit to a health professional would have to pay for every contact) as a way to control health care costs. The assumption is that this will deter people from visiting their doctor for unnecessary reasons. Consider the broad implications of this policy for health and health care costs. For example, do you think the approach will save health care costs? At what expense?”

In assessing this scenario the rater(s) understand that there is no right or wrong answer *per se*, and they are not assessing specific knowledge or whether they agree or disagree with applicants’ points of view. Rather they are assessing the applicants’ interpersonal skills, their interests in the situation or dilemma, ability to address multiple perspectives, and communication skills (both verbal and non-verbal).

In assessing applicants, the raters are trained to score and evaluate each student on both a Likert scale measuring specific skills or characteristics and a summative statement about how the score

was determined. Because each applicant will have proceeded through 8-10 scenarios and each rater will have assessed multiple applicants, the aggregated assessments are felt to be more objective and able to provide evaluations of specific and important issues, skills and personal attributes.

At this juncture it is best to consider the MMI as an experiment – albeit one that has a fair amount of data and experience behind it. Our hope of course is that it will make our medical school admission process even more successful. We certainly hope that will be case – and updates will follow after we have had a year or so of experience with MMI.

Nuclear Medicine and Molecular Medicine Opens New Facilities

After nearly 8 years of planning, Stanford Hospital & Clinics (SHC) opened its new Nuclear Medicine and Molecular Imaging Clinic on October 21st (see: <http://stanfordhospital.org/newsEvents/newsReleases/2010/nuclear-medicine-clinic-opening.html>). This new \$25 million 16,000 sq ft facility located on the second floor of SHC features state-of-the-art PET and CT facilities and will house developing technologies that will shape the future of early diagnosis. The ability to track health and disease states down to the molecular level has been the vision of Dr. Sam Gambhir, who is the Director of the Molecular Imaging Program at Stanford and director of the Division of Nuclear Medicine. This incredible new facility will not only utilize the latest and most advanced diagnostic imaging facilities but also create innovations and technologies that will advance this rapidly emerging field of early diagnosis – with immediate applications to cancer, cardiovascular diseases, neuroscience and other disorders. This new facility places SHC and Stanford in the forefront of modern imaging and offers yet another way that our patients and communities will be uniquely served.

Launching of the Association of Adjunct Clinical Faculty

Academic Medical Centers (AMCs) are comprised of a number of intersecting groups: basic and clinical faculty, students, staff and members of the community who contribute to the enrichment of our programs. In March of 2003, as part of a number of organizational changes in the School of Medicine's professoriate, we developed the category of Adjunct Clinical Faculty (see: http://deansnewsletter.stanford.edu/archive/03_17_03.html#3) for valued community-based physicians who volunteer their time to help teach students and trainees. The ACF replaced the preceding appellation of "Voluntary Clinical Faculty," and included clearer criteria for appointment as well as advancement. I am extremely grateful to our community colleagues but also recognize that, unlike our full-time faculty, they have not had an institutional presence or a means of collectively communicating their views. Clinical departments appoint ACF, and we certainly want to continue the important anchoring and interaction that occurs at the discipline or department based level.

Because ACF are primarily located in their clinical practice settings, there have been times when misunderstandings or miscommunications have arisen. This was somewhat dramatically illustrated earlier this year regarding certain interactions of community physicians with industry that prompted the extension of our Stanford Industry Interaction Policy to everyone with a Stanford title, including ACF (see http://deansnewsletter.stanford.edu/archive/04_05_10.html#1). This led to considerable confusion and anger by a number of valued community physicians who

either disagreed with the policy or felt it should not apply to them. Importantly, this episode also illustrated that we lacked a regular and clear means for bilateral communication – which clearly would result in future challenges and problems. Accordingly, after a number of communications and discussions, we agreed that an Association of the Adjunct Clinical Faculty (AACF) at Stanford should be formed. A number of faculty led this effort in discussions with me and members of the Dean's Office and they have formed an Interim Executive Committee that is chaired by Dr. Harvey Dondershine, Adjunct Clinical Associate Professor of Psychiatry and Behavioral Sciences. This week the AACF launched its new website at <http://aacf.stanford.edu>.

I certainly encourage all ACF to become active in the AACF, and we look forward to improved communications, interactions and collaborations. And I also want to thank our ACF again for their many contributions to our students, trainees and community.

Berry Fellows Celebrate Twenty Years of Excellence

On October 29th we had the wonderful opportunity to celebrate the 20th anniversary of the Berry Fellowship Program at Stanford. This very special program was established in 1990 by a gift from Walter and Idun Berry, who wished to “benefit humanity through advancing and expanding the understanding of children's health and disease in both the clinical and basic medical sciences.” From its beginning, Berry Fellowships have been awarded to promising postdoctoral fellows from basic and clinical departments. During the past 20 years, 75 Berry Fellows have been named, and their record of success has been outstanding. Overall, over 75% of the Berry Fellows are in full-time academic careers or in research positions in industry. This is a wonderful tribute to the selection committee and, of course, to the fellows and their research mentors and advisors.

What also makes the Berry Fellows Program unique is the dedication and commitment of the Board members and advisors, who visit Stanford each year and take a special interest in each succeeding class of Berry Fellows – and those who have preceded them. Once again Board members Walt Borneman, Michael Cruson and Bill Valentine were in attendance, along with Board Advisor Bob Demmler. Special thanks must also be given to the Stanford faculty and staff who helped launch and spearhead the Berry Fellows Program, including Drs. Charles Prober, Alan Krensky, Harvey Cohen and Mark Kay and Ms. Carol Kersten from the Office of Medical Development.

For the 20th Anniversary a special symposium was held featuring Drs. Don Ganem, Professor of Medicine and Microbiology and Member of HHMI at UCSF, and Dr. Brian Druker, JELD-WEN Chair of Leukemia Research and HHMI Investigator at the Oregon Health & Science Center. Special thanks to Mark Kay for organizing the symposium, which also featured past Berry Fellows as well as posters by the newest Berry Fellows, Gregory Bowman, PhD; James Scott McClellan, MD, PhD; and Ye Zhang, PhD.

Thanks and congratulations to all!

Another Great Beckman Symposium

On October 25th, Drs. Lucy Shapiro, Virginia and D. K. Ludwig Professor and Director of the Beckman Center for Molecular & Genetic Medicine, and Ben Barres, Professor and Chair of the Department of Neurobiology, hosted the 2010 Beckman Symposium. This year's symposium offered a wonderful panel of outstanding presentations by world-class speakers who covered some of the most interesting and challenging themes in neuroscience. Thanks to Drs. Shapiro – and this year's symposium chair Ben Barres – for another great Beckman Symposium.

Peter Sarnow Is New Chair of Microbiology and Immunology

I am pleased to announce that Dr. Peter Sarnow, Professor of Microbiology and Immunology, will succeed Dr. Karla Kirkegaard as the next chair of the department. As you will recall, chairs of basic science departments generally rotate this administrative responsibility among the senior faculty. Dr. Sarnow is well poised to assume leadership.

Dr. Sarnow joined Stanford in 1996 from the University of Colorado Health Science Center. He did postdoctoral training with David Baltimore at MIT and graduate work with Arnold Levine at SUNY Stony Brook. His research focuses on micro-RNA regulation of hepatitis C as well as novel mechanisms of translation initiation by internal ribosome entry in hepatitis C as well as in picornaviruses and some insect viruses. Dr. Sarnow is currently an editor of the journal *Virology* and is on the editorial board of several other important journals. He was elected a Fellow in the American Association for the Advancement of Science in 2010. Please join me in welcoming Dr. Sarnow as a new department chair and member of the School's Executive Committee.

Thank you to Dr. Kirkegaard for the significant contributions she made to the department during her tenure as chair.

Bike Safety – A Continuing Issue

Over the years I have expressed a number of concerns about bike safety in the Dean's Newsletter. Thankfully a number of improvements have taken place to make bike safety on campus better, due to the work of Ariadne Delon Scott, the Bicycle Program Coordinator. That said, considerable improvements in safety are still needed, as I can attest to based on my daily travels on campus – especially at night, when few students are wearing helmets or have lights or even obey the rules of the road that I know they have been alerted to during orientation.

Currently the Bike Safety Dorm Challenge

(<https://pmplus.stanford.edu/pats/transportation/dormchallenge/>) is underway (October 27-December 10th) with the “Grand Prize” being a free bus charter to Tahoe. I hope that continued improvements in safety occur – knowing full well that I personally experience “near misses” with some regularity.

I also want to thank a number of our medical school students for working with the University to fit helmets for students – including: Bryan Chen, Anthony Kava, Alec Palmerton, Jevon Plunket, Jessica Tsai, Ashley Valentine, and Joselyn Woodward.

Health and Safety Update

At the Executive Committee meeting on Friday, November 5th, David Silberman, Director of the School's Health and Safety Office, provided an update on changes that have been occurring in

the regulatory environment and on the need for continued training, awareness and vigilance in this area. He encouraged the chairs to discuss health and safety issues with their faculty and to consult with the Health and Safety Programs office if any questions or situations arise. He encouraged the use of the Training Needs Assessment Tool (TNAT) in STARS, which now allows an individual to assess what training is needed.

I want to underscore the importance of David's message to the Committee. It is imperative that the proper training be completed by everyone in the School, at whatever level is required for his or her position. This is important for the safety of our medical school community as well as the need to be responsive to increasing regulatory scrutiny. I urge you to make use of the TNAT capability now available and to contact the Office of Health and Safety Programs with any concerns you have. Their phone number is 723-0110, and David Silberman can be reached at 723-6336 or silberman@stanford.edu. The web site is: <http://med.stanford.edu/somsafety/>.

Awards and Honors

- **Dr. Michele Barry**, Senior Associate Dean for Global Health and Professor of Medicine, is the recipient of a \$8 million NIH Director's award to help establish a global health consortium at Stanford geared to accelerating progress in diagnostics, drugs and devices. The Fogarty International Center will administer this important effort that is designed to encourage integration of the university's business, design, medicine and engineering programs to cultivate new collaborations and expand scientific progress in global health.

In addition, Dr. Barry was awarded the Ben Kean Medal at the 59th annual meeting of the American Society of Tropical Medicine and Hygiene (ASTMH) in Atlanta. The Ben Kean Medal recognizes exceptional dedication to clinical tropical medicine and to the training of students, fellows, and practitioners of tropical medicine, and is one of the Society's highest honors. Congratulations to Dr. Barry for this richly deserved award

Separately, Dr. Barry with her co-principal investigators **Dr. Bonnie Maldonado**, Professor of Pediatrics and chief of the Division of Pediatric Infectious Diseases, and **Dr. David Katzenstein**, Professor of Infectious Diseases, have received a \$10 million grant from the NIH Medical Education Partnership Initiative to improve medical education at the University of Zimbabwe over the next five years. Congratulations to Dr. Barry and her colleagues.

- **Dr. Joe Wu**, Associate Professor of Medicine and of Radiology, is one of 85 researchers named by President Obama to receive Presidential Early Career Awards for Scientists and Engineers. This is the highest honor that the US government awards to science and engineering professionals in the early stages of their independent research careers. This award was first established by President Clinton in 1996 and provides research support for innovation and discovery. Dr. Wu has won a number of distinguished NIH awards including an NIH Director's New Innovator's Award and an NIH Transformative RO1 Award. He is off to an amazing start in his career trajectory. Please join me in

congratulating Dr. Wu.

Appointments and Promotions

- **Harley H. McAdams** has been reappointed to Professor (Research) of Developmental Biology, effective 6/01/11.
- **John Oghalai** has been appointed to Associate Professor of Otolaryngology – Head and Neck Surgery effective 11/01/10.
- **Sharon J. Pitteri** has been appointed to Assistant Professor (Research) of Radiology, effective 11/01/10.
- **William H. Robinson** has been promoted to Associate Professor of Medicine effective 11/01/10.
- **Harley H. McAdams** has been reappointed to Professor (Research) of Developmental Biology, effective 6/01/11.
- **Jamie M. Zeitzer** has been reappointed to Assistant Professor of Psychiatry and Behavioral Sciences, effective 2/01/11.

Dean's Newsletter November 22, 2010

Welcome to Amir Dan Rubin, the new President and CEO of Stanford Hospital & Clinics (SHC)

You likely know by now that Mariann Byerwalter, Chair of the Board of Directors of Stanford Hospital and Clinics (SHC), announced on Friday, November 12th, that Amir Dan Rubin will be the new President and CEO of SHC effective January 3, 2011. He will replace Martha Marsh, who retired on August 31st. Ms. Byerwalter co-chaired the Search Committee with John Scully, also an SHC and Stanford University Board member. I served on the Search Committee along with Drs. Steve Galli, Chair of the Department of Pathology, and Bill Maloney, Chair of the Department of Orthopaedics, who both represented the School of Medicine. We are unified in our enthusiastic support for Mr. Rubin, who is currently the Chief Operating Officer at UCLA, a position he has held since 2005. Amir Rubin has had a meteoric rise as a leader in hospital administration, having also held leadership positions at Stony Brook University Hospital in New York and the Memorial Hermann Hospital Healthcare System in Houston Texas.

I was charged by the Search Committee to do the reference checking on Mr. Rubin, and I am happy to say that I heard from medical school, faculty and hospital leaders a consistently incredible chorus of praise for Amir's intelligence, commitment, and ability to work with virtually everyone to solve problems and challenges. I also heard praise about his appreciation and support for the research and teaching missions of academic medical centers and his dedication to making these programs vibrant and stronger. While these comments are enormously assuring, perhaps the strongest evidence of how highly Amir Rubin is viewed by his colleagues at UCLA comes from the announcement sent out to the faculty and staff by David T. Feinberg, MD, MBA, CEO of the UCLA Hospital System and Associate Vice Chancellor, to the UCLA community. Here it is:

"I write to you with very mixed emotions to announce that Amir Rubin will be leaving his role as chief operating officer to become CEO for the Stanford Hospital and Clinics in January. Through Amir's visionary leadership and tireless efforts over the past five years we have advanced our operations systems to become highly effective, accountable, service responsive and efficient. Because of Amir's leadership UCLA is now the model in health care for the manner in which we adopt "Lean" process improvement ideals and methods in our everyday practices. As the principal architect of "CI-CARE" Amir has been instrumental in reshaping the UCLA Hospital System to become a leader in offering a positive patient experience that measures up our world-renowned clinical quality. Under his leadership our patient satisfaction scores went from the 38th percentile among 600 hospitals surveyed nationally to ranking in the 95th percentile and first among academic medical centers nationally. Along the way Amir has built a tremendous management team and inspired staff commitment that will indeed carry UCLA forward to "Heal humankind, one patient at a time by improving health, alleviating suffering and delivering acts of kindness." [Amir Rubin, 2007].

On a personal note, I will miss Amir for his genuine caring and friendship, his great sense of humor and his unwavering commitment to raise the human spirit through his everyday words and deeds. I know you join me in wishing Amir, Nicole and their children Naomi and Ben the very best as they embark on the next chapter in their extraordinary lives."

Please join me in welcoming Amir Dan Rubin to the Stanford Medicine Community.

The Fourth Stanford Summit on Clinical Quality and Performance

On Thursday November 18th Dr. Bryan Bohman, Chief of Staff at Stanford Hospital & Clinics (SHC), along with Dr. Christy Sandborg, Chief of Staff at Lucile Packard Children's Hospital (LPCH), led the Fourth Stanford University Medical Center Summit for Clinical Excellence. For the first time the Summit was held in the Li Ka Shing Center for Learning and Knowledge; over 200 physicians, nurses, health professionals, administrators and hospital board directors from the School of Medicine, SHC and LPCH gathered there for the day. Importantly and appropriately, we have put a high premium on improving the quality of clinical excellence throughout the Medical Center, and we have measured our progress in doing so. We were all chastened to learn nearly five years ago that the UHC (University Health Consortium) ranking of SHC in clinical

quality was in the bottom decile. Major and sustained efforts were made by the School and SHC to improve performance, and we witnessed progress each year - in 2010 SHC ranked in the top quartile. This is a tribute to the work of faculty, physicians, nurses, administrators and staff across the Medical Center. It is also a reflection of the outstanding leadership of Drs. Kevin Tabb, Chief Medical Officer, and Norm Rizk, Senior Associate Dean for Clinical Affairs, in concert with Chief of Staffs Bryan Bohman and Christy Sandborg. Our shared intent is to keep improving, and we should not be satisfied until we have achieved sustained improvement and the highest quality of clinical care possible. We can do no less.

While clinical excellence and quality performance are essential they are not sufficient. We must also make much more progress in the clinical services that define the patient experience. Our performance in this area is inadequate, but efforts to improve clinical quality are underway and are already showing modest gains. Much work remains, and the goal of close alignment of the quality and excellence of patient care with the quality and care of the patient experience must be pursued in synchronous and concerted efforts. Furthermore, these improvements must be carried forth with an effort to dramatically improve the value proposition of our clinical services. We are too costly and going forward it will be imperative to focus intensively on quality, service and cost. Indeed, it is also clear that rapidly developing changes in payment reform are unfolding that will be tagged to quality outcomes and not simply to the amount of clinical work performed.

These changes will also be coupled with the need of medical centers to form integrated hospital, ambulatory and community based services capable of managing populations and to engage in managed risk through Accountable Care Evolutions (the final configuration of which is still be determined). Major changes and innovations in clinical care delivery in hospital and outpatient as well as home care settings will be required to meet this need – something that most academic medical centers are only beginning to learn to do. We are also on a steep learning curve, and it is clear that we have to accelerate our efforts given the changes likely to take place over the next 2-3 years. Thankfully, we have begun this process and also have developed initiatives to address these challenges, such as the Clinical Excellence Research Center being led by Dr. Arnie Milstein, Professor of Medicine.

In addition to excellence in the quality and cost of clinical care and patient service, it is also imperative that Stanford Medicine have outstanding physician providers and that we lead in innovations and discoveries that create knowledge and ultimately provide new improvements in the diagnosis, treatment and prevention of human disease. The question of how to foster innovation while reducing the variability of patient care was the focus of the Fourth Summit. While it might be argued that any attempts to standardize patient care – through protocols, management guidelines or algorithms – runs the risk of stifling patient care or is at odds with the move to “personalize medicine,” I think a compelling case can be made that innovation and protocol management are not at odds and that one helps to affirm and substantiate the other.

We had the opportunity to approach the balance between innovation and standardization from a number of different perspectives. Dr. Arnie Milstein led a panel in which Dr. Tom Krummel, Emile Holman Professor and Chair of the Department of Surgery, and I participated. We also heard a presentation from this year’s guest speaker, Dr. Alfred Casale, Associate Chief Medical Officer at the Geisinger Health System – one of the national leaders in provider and payment

reform. In addition, Drs. Pat Gibbons, Clinical Assistant Professor of Medicine and Associate Medical Director of Quality Improvement, and John Wachtel, Adjunct Clinical Professor in the Department of Obstetrics and Gynecology, provided case study experiences.

From my perspective, we have an opportunity to create a continuing learning environment at Stanford that combines and integrates innovation and discovery with protocol management that helps standardize therapies to achieve high quality and lower cost. My reference point is pediatric oncology, a discipline I have been part of for a number of decades. Unlike virtually any other part of clinical medicine, the care of children with cancer almost always occurs under the banner of a clinical protocol that is designed to compare current state-of-the-art care with an opportunity to improve care, often as part of a randomized clinical trial. New innovations are key to future improvements in healthcare, but each new innovation requires validation. Carrying out “innovative care” without an attempt to assess outcomes and ascertain whether they offer an improvement to “standard therapy” can perpetuate less optimal or more expensive options or miss the opportunity to validate useful innovations that should become part of standard therapy.

In many ways the sequential improvements in the care of children with cancer are the result of a constant interaction between innovation and standardization – with evidence-based innovations becoming integrated into the sequential “standardizations of care.” This is true for adults with cancer, although far fewer enter clinical trials. The cycle of innovation and standardization has also been extrapolated to many other diseases – including AIDS, cardiovascular disease and others. Conversely, presumed “innovations” have also been shown to have negative outcomes when subject to clinical trials that standardize management and underscore the importance of validating whether an innovation is truly beneficial. Also of interest is the observation that simply taking part in a clinical protocol that “standardizes care” improves outcomes – even when patients are in the less effective treatment arm of a therapeutic regimen.

It must be clear that I am strongly supportive of innovation and discovery, and I firmly believe in the importance of physicians and scientists creating new options for diagnosis, management and prevention of disease that break past molds of assumption or standard practice. And of course I recognize that the cycle and process of innovation in drug and even immune based therapies are different from surgical and technological innovations. But I also believe that, regardless of the innovation, validation is important, followed by its incorporation (or not) into “standard therapy.” It seems plausible that at any point in time a standard regimen can be employed for a specific disease or illness (perhaps between 50-80% of the time) as long as there is regular assessment of the standard regimen and the incorporation of new innovations as they emerge or evolve. By treating the majority of patients on standard protocols we have the opportunity to better manage outcomes, improve quality and service and control costs (by determining which tests or studies should be performed and when they should be done).

The use of an electronic medical record should make such protocols easier and more reliable to conduct and can also incorporate education modules as well as management tools. Further, such protocol based therapy permits more team based management (by doctors, nurses and other professionals) and can enhance training and education by staying closer to evidence-based interventions in contrast to “my experience” ones. If I could do so, I would have the majority of patients admitted to clinical care programs enrolled in a protocol that added new knowledge as

well as provided standard therapy. I also hasten to add that protocol based management is not a counter to “personalized medicine,” since the determination of which protocol or treatment patients receive can be determined by the eligibility requirements they meet as a consequence of defining personalized metrics.

In my opinion standardizations of management are inevitable and can be done in concert with innovative care and discovery. The absence of standardization will lead to a greater number of poorer outcomes and errors and will deteriorate both quality and clinical performance metrics. Protocols or new standards can address disease management as well as specific problems and can also be open to new observations as they emerge. The process of innovation and standardization should help define the future of Stanford Medicine.

Stanford Medical School Faculty Senate Takes a Stand on Same Sex Marriage

Across the USA there has been a contentious debate about whether same-sex marriage is a civil right. The debate has engendered strong emotional reactions from all sides of the religious, ethical and political spectrum. The opinions expressed pose moral outrage on both sides of the equation but have failed to assess the impact of the decision on the health outcome of the adults and children who are affected by varying positions and opinions. I am very pleased that the Stanford School of Medicine Faculty Senate considered the issue of health disparity and same-sex management and unanimously approved the following resolution on Wednesday November 17th.

The Faculty Senate at Stanford School of Medicine supports granting the rights of civil marriage to same-sex couples as part of our commitment to reduce the documented health care disparities affecting those couples, their families, and their children.

I fully endorse this resolution and thank the Faculty Senate for taking this position. I also want to thank Dr. Gabe Garcia, Professor of Medicine and Associate Dean for Medical School Admissions, for bringing this important issue to the attention of the Senate.

An Update on Space

At the November 19th Executive Committee two important presentations on medical school space and facilities were considered. First, Dr. Sherril Green, Professor and Chair of the Department of Comparative Medicine, provided an update on the current status of animal space both on and off campus and the important strategic planning process now underway to determine and optimize future animal research space for the School of Medicine as well as Stanford University. Then Niraj Dangoria, Assistant Dean for Facilities Planning and Management, presented a comprehensive update on both on-campus and off-site developments.

We have been in a constant planning mode for space utilization during my time as Dean. My last major update on facilities planning was in the December 4, 2006 Dean’s Newsletter (see: http://deansnewsletter.stanford.edu/archive/12_04_06.html). Over the past year we have realized the fulfillment of some of this planning with the opening of two highly visible projects (the Li Ka Shing Center for Learning and Knowledge and the Lorry Lokey Stem Cell Research

Building- Stanford Institutes of Medicine I) as well as the less visible but very important project that created a new loading dock and underground tunnels connecting our medical school campus. These new facilities have transformed the face and appearance of the School of Medicine and, perhaps for the first time in many decades, have created architectural harmony, consonance and coordination. Despite these dramatic changes, this is best viewed as Phase I of a process extending out over the next decade or more that will ultimately add two additional Stanford Institute of Medicine Buildings and replace the GALE (Grant, Always, Lane and Edwards) buildings by three new Foundations in Medicine Buildings. And of course also coming are the New Stanford Hospital and the major addition at the Lucile Packard Children's Hospital, both of which will further transform the Medical Center.

Between 2001-2010, School of Medicine space has increased from 1,102,456 net available square feet (nasf) to 1,558,543 nasf, of which 238,655 nasf is on campus and 214,642 nasf is off campus. The growth in space includes laboratory, office, vivarium and support space. At the same time, our basic and clinical science faculty numbers have increased such that the overall amount of space per faculty member remains unchanged. Although I doubt it feels this way, nearly all basic and clinical science departments have had a net increase in space between 2004 and the present time.

Despite these changes, concerns about the adequacy of space is one of the major and continuing issues for faculty and department chairs – as is the length of time it takes to address space needs. We are also concerned about this but offer this perspective. In addition to the major construction and renovation onsite and offsite projects that cost \$20 or more million (the LKSC, Lokey-SIMI, Connecting Elements and Arastradero facilities), there have been 10 other projects ranging in cost from \$2-10 million that have been completed in this same time period along with 19 projects costing under \$2 million. Each is important to the individual user and all consume time and resources. Plus, there are nearly 50 ongoing facilities projects and renovations – some of which we have anticipated and initiated and others that are the result of decisions made by others in the area (e.g., the need to relocate a large number of faculty and staff when LPCH took over the 701/703 buildings to prepare for hospital construction and required that we move out). The bottom line is that faculty and individual departments only see a portion of the large number of complex projects underway.

Going forward, the overarching principles we established at the onset of our master facility planning still obtain. We want to do everything possible to keep research programs on campus – something we hope will be optimized by the future build-out of the Stanford Institutes of Medicine II-III as well as the Foundations in Medicine I-III. Along with new construction will also come the demolition of aging facilities (e.g., GALE along with other facilities to provide GUP [general use permit] space or to permit the footprint for major construction projects). There will also be the need for renovation and repurposing of other buildings (e.g., Fairchild Science). A major immediate and continuing priority is to develop more vivarium space, some of which will be on-campus and some off-campus. The future requirements for animal space will also be driven by the strategic planning activity referred to above that is now ongoing. We will also need to develop space for cores (some of which will need to be off-site) as well as surge space. A major unmet need that will prove increasingly critical is space for clinical faculty – especially as

hospital construction gets underway. And, needless to say, the hospital construction projects will have an impact on all facilities simply because of their size, scope and timelines.

We are also seeking to more rationally organize our now quite significant off-site space and leases to accommodate consolidation (e.g., administration space) but also to permit the development of facilities for innovation (e.g., genomics and early diagnosis) and surge space. As some of you will know, over the past 18 months we explored the prospect for doing this on the Roche campus site but have now abandoned those plans since the costs proved prohibitive. We are now exploring an opportunity to develop a consolidated off-site campus on Porter Avenue – which appears to offer both immediate and long-term opportunities. I will have more to say about this in the future.

We are also working to finalize our facilities on Welch Road, most immediately with the planning for the Jill and John Freidenrich Center for Translational Research, which will be located at 800 Welch Road. Construction of this Center will begin in 2012. We are also exploring opportunities for a contiguous building on Welch Road that will further optimize our clinical and translational research programs.

So while a lot of very visible changes have occurred over the past 3 years that have begun the transformation of the School of Medicine, numerous other projects have been completed, are ongoing or will soon be initiated to further our efforts. Over the next several years we can look forward to additional major projects on campus as well as the development of some unique opportunities off-campus. While each of these projects is important, the most critical issue is to continue to support our most important resource – the faculty, students and staff who comprise the School of Medicine. It is their work that makes these capital investments important – and that helps to support the future of Stanford Medicine.

Town Hall Meeting with Students

On Monday evening November 15th, Drs. Charles Prober, Clarence Braddock and I had the opportunity to participate in one of our regular Town Hall Meetings with students. We welcome these opportunities to interact with our students and to learn about the issues they are facing or are concerned about. These sessions provide an opportunity to engage in dialogue and, as best as we can, to address current issues. We spent the most time discussing the status of the CBEI (Criterion-Based Evaluation Initiative), which commenced this past June (<http://med.stanford.edu/md/curriculum/CBEI/index.html>). While there was understandable anxiety and even some consternation before CBEI was launched, I am pleased to note that it is moving forward successfully. It is already apparent that many more faculty are participating in the evaluation process than was the case prior to CBEI– which has been largely normalized across clinical departments. There are many outstanding issues and a clear need (and expectation) to evaluate the impact of CBEI thoughtfully and appropriately – but this is now in progress. I will plan a more complete report after more experience is gained. I am thankful and appreciative of the constructive input of our students to this and other major initiatives underway.

Annual Meetings for All Faculty – Regardless of Rank or Seniority

In an earlier Newsletter (http://deansnewsletter.stanford.edu/archive/07_26_10.html#4) I posed the question of whether chairs (or their delegates) should hold annual meetings with senior faculty in the same way as they now are expected to do with junior faculty. In that article I reported on a discussion of this question led by Dr. Gary Schoolnik, Associate Dean for Senior Faculty Transitions, at an Executive Committee meeting in July. Dr. Schoolnik recently returned to the Committee for further discussion and to propose a set of concrete recommendations he and his colleagues in the Office of Academic Affairs have developed. These recommendations include the following:

- There should be regular individual (annual) meetings of senior faculty with their chairs/chair delegates. Parenthetically, it turns out that 50% of senior faculty already have such meetings.
- The Office of Academic Affairs will provide a standardized form/template for these meetings; departments may also use their own forms.
- Among the topics for this meeting would be:
 - A discussion of the faculty member's plans over the next 1 year, 5 years and 10 years in the areas of teaching, research and clinical care.
 - Expectations of the chair/chief for the faculty member - and the reverse.
 - The identification of action items
- There should be a written record of the conversation.

The chairs agreed on the importance of the kind of continuing dialogue that annual meetings allow for, and they acknowledged that it is important throughout a faculty career. At the senior level, the topic of retirement can be challenging both for faculty and for their chairs, and Dr. Schoolnik noted the resources available in the Office of Academic Affairs to assist in discussing this subject. For many faculty their career is not a "job" but rather a cause, or a mission, and the separation that occurs at retirement can be daunting. The chairs felt that we should think of ways to be more welcoming of the ongoing involvement of emeriti faculty. One chair pointed out that economic preparation for retirement should begin early in the career, and he introduces it to his junior faculty when they first join the department.

The Executive Committee endorsed the idea of annual meetings with all faculty along the lines proposed and discussed here, with the caveat that in small, cohesive departments, the meetings might be less frequent, while still done on a regular basis. The Office of Academic Affairs will follow up and implement this process. I am very supportive of this outcome and look forward to its incorporation into the life of all our departments.

Dean's 2010 Staff Awards:

Employee of the Year SPIRIT Award, and the INSPIRING CHANGE LEADERSHIP AWARD

On April 21, 2011, the School of Medicine will again award the Dean's Annual Employee of the Year SPIRIT Award to two exceptional staff members, who will have been selected based on outstanding dedication, initiative, motivation, positive attitude and customer service. In addition to the annual SPIRIT Award, this year the School is inaugurating another staff award, the INSPIRING CHANGE LEADERSHIP Award. This Award will recognize an individual staff

member who initiates or leads change and innovation: implements new processes, systems, organizational structures, or operating paradigms which will result in transformative improvements in service, efficiency, value, effectiveness, outcome, or satisfaction. Criteria for this award will be broad in scope so as to encompass significant change or innovation affecting an entire work group, department, or multiple departments. This award will be given to an individual (or up to two individuals) at any level or unit in the School of Medicine who have led an innovation project and who have service at the School of Medicine of at least 2 years. A school-wide email announcement is going out today to all faculty, staff, students, and post docs. Please go to the following url: <http://med.stanford.edu/employeeRecognition/awards/> which will connect you to the website for further information as well as the eligibility criteria for both awards. After you have reviewed the criteria, please submit your nomination for either award using the online Nomination Form – be sure to select the correct “button” SPIRIT Award or INSPIRING CHANGE LEADERSHIP Award and describe why your nominee meets the specific criteria for that award.

Please note: DEADLINE FOR SUBMITTING NOMINATIONS IS Thursday, December 9, 2010.

Happy Thanksgiving

It seems hard to imagine that we are zooming into the holiday season, with Thanksgiving later this week. I want to take this opportunity to wish each of you along with your family and friends a very Happy Thanksgiving and Holiday Season. Have fun, be well and wear helmets and lights if you are riding bikes.

Awards and Honors

- I am very pleased to let you know that Scope (the blog from members of our Office of Communications and Public Affairs) has *won* a 2010 Excellence in New Communication Award for blogging from the *Society for New Communications Research*. The Society's awards program honors individuals, corporations, nonprofit organizations, educational institutions, and media outlets that pioneer the use of social media and other communications technologies. This is wonderful honor and tribute to our terrific communications staff.
- **Dr. Frank Longo**, George E. and Lucy Becker Professor and Chair, Department of Neurology and Neurological Sciences, has been named one of GQ magazines “Rock Stars of Science” (see: <http://med.stanford.edu/ism/2010/november/longo.html>) and is featured in the December issue of GQ. None of us will be able to think about Dr. Longo the same way now that he is a rock star. Truly, congratulations to Dr. Longo (or is it just “Frank” from now on?).
- **Dr. Paul Berg**, one of our most revered and respected faculty was honored for Lifetime Achievement at the 2010 Pantheon Ceremony. Congratulations to Dr. Berg.
- **Dr. Lawrence "Rusty" Hofmann**, Associate Professor and Chief of Interventional Radiology, is the inaugural recipient of the Ohio State School of Medicine Early Career Achievement Award for his significant contributions to the field of medicine before the age of 40. Congratulations, Dr. Hofmann.

Dean's Newsletter

December 13, 2010

Happy Holidays and Winter Break

Amazingly, we are once again in the midst of the winter holiday season. Thanksgiving, Al-Hijira and Hanukkah have just passed, and Christmas and the New Year celebrations lie ahead. And there are many other unnamed holidays members of our community celebrate at this time of year. Whatever they are, I wish you and your family the best for the season!

For the past couple of years the School of Medicine has joined with the University in having a two-week winter closure, which this year begins on December 20th. We will reopen on January 3rd. Of course I am fully cognizant that many of us will be working during that time – carrying out experiments, caring for patients, catching up on papers, etc. But one of the great joys – or is it dividends - of the university-wide winter closure is the virtual shutdown of email and other distractions. I have heard from so many of you that you relish this break from the constant onslaught of email and related communications. Accordingly, I would like to encourage all of you (including me, of course) to refrain from initiating email communications beginning December 18th and continuing through January 2nd, unless a communication is really important. Obviously that is left to your discretion. I am sure everyone will use their best judgment – but the collective view is that this natural break in electronic communications is one of the best gifts one can receive during the holiday season. So, enjoy, silently and respectfully.

Some Reflections on 2010: A Time of Ups and Downs

At least in things professional I am an optimist. In fact I often relish challenges that seem insurmountable or which require persistence and endurance. As most of you know, that is the focus I have brought to my now nearly ten years at Stanford. Each day and passing year has been filled with opportunity and excitement.

As I think back on this past year I am reminded of the unfolding events and debates that will now shape the fabric of science and healthcare as well as the future of our communities and, indeed, the very integrity of our nation. Individually and collectively we have all ridden the ups and downs of expectation and disappointment over the past twelve months. And while some may feel a foreboding, I believe that we can rise above the challenges ahead and emerge successfully. To a great extent, my positive view is the result of the hard work that you have been doing during the past year(s) and that has positioned Stanford Medicine quite well for the future we now face. In previous communications I have opined that it has long been my hope that Stanford would become a role model for the future of academic medicine. I believe we will – and that we must.

The year began with expectations that healthcare reform might actually become a reality and that research funding (especially because of the American Recovery and Reinvestment Act of 2009[ARRA]) was making a difference (see: <http://med.stanford.edu/stimulus/>). As of December 1, 2010 Stanford had received 275 ARRA “Stimulus” grants for a total of \$131, 458, 547 (or

1.5% of the total awards), which is notable since this figure does not include large facilities grants. The ARRA research funding has been a significant help to many of our faculty, especially after the shrinking NIH budget between 2003-2009. Unfortunately, the continued economic downturn in the USA and the political battles now raging in Washington, DC and beyond almost surely forecast a decline in federal funding for research with the expiration of ARRA.

We have known this was coming for some time. Most recently, I heard serious concerns about future NIH funding during the NIH Directors' Leadership Forum I attended on November 29th. A major worry for the NIH has been the growth of the biomedical community nationally – in many ways it now exceeds the pipeline of available funds. Part of the problem is that many medical schools sought to increase their stature by rising in the ranks of NIH funding and thus recruited more faculty and built more research facilities to house them. I have long felt that using total NIH funding as a record of success is an incorrect metric since it emphasizes quantity over quality. Unfortunately, many academic leaders subscribed to the value of growth, and this is now becoming an increasing liability for many centers. I know this sounds harsh – but race for national “stature,” made worse by the US News and World Report rankings, which emphasize size over quality – has contributed to this problem.

Thankfully, at Stanford we have prized quality – in our faculty and students – and we have emphasized excellence over “size.” Indeed, we remain among the smallest medical schools in the nation, but we are fortunate in having among the strongest research faculty – and more funding per faculty member than any other school. We have a disproportionately larger percentage of our full-time faculty who are members of the Howard Hughes Medical Institute or who have been elected to the National Academy of Sciences (NAS) or the Institute of Medicine of the NAS. While there is no doubt that the years ahead will be also challenging for Stanford faculty, I am confident that as a community we will fare well. We haven't overbuilt and we have been thoughtful and strategic in our investments in faculty, departments, centers and institutes. We are continuing to recruit exceptional faculty, while still keeping our numbers lean and focused. And while the changes in our physical landscape have been notable (e.g., the Li Ka Shing Center for Learning and Knowledge, Lorry Lokey Stem Cell Research Building/SIM1), we have been judicious in space allocation and utilization. Again this is a tribute to our faculty and staff – for it is their success that makes this possible.

Of course, going forward we have lots of space challenges – a number of which I addressed in my November 22nd Newsletter (see: <http://deansnewsletter.stanford.edu/#4>). But at least to date we have been successful in renewing facilities while incurring very little debt – which also highly differentiates us (and positively so) from nearly all of our peers. That said, preserving and enhancing our research faculty is among our highest priorities. Excellence in discovery and innovation and especially in fundamental basic science is what continues to distinguish Stanford – but sustaining that excellence will require constant investment and renewal. While this will surely be challenging, it is something we can be even more focused on. Indeed, among my highest priorities is to raise additional gift support for faculty career development – in the form of professorships, directorships and the like. Hopefully as the economic climate improves we will have greater success in this incredibly important effort.

As you also know from many prior communications, I (along with countless others) worked to help facilitate healthcare reform (see: http://deansnewsletter.stanford.edu/archive/01_25_10.html; http://deansnewsletter.stanford.edu/archive/04_05_10.html#2; http://deansnewsletter.stanford.edu/archive/09_27_10.html#4). But the political rancor that surrounded the final phases of the healthcare debate, all the way through the signing of the Affordable Care Act of 2010, left most of us in the medical profession, as well as the wider public, confused and concerned about what actually had been accomplished and whether the essential components of reform would actually happen. Indeed, the sense of excitement when President Obama signed the ACA on March 23, 2010 was not (as had been hoped) a prelude to relief and acceptance by the broader public – but rather the entree to even more debate and concern, frequently with biased information or misinformation. In some ways this whole episode culminated in the rhetoric that resonated throughout the midyear elections this November. I will refrain from a political commentary and only say that regardless of one’s frame of reference, we have to move forward in reshaping healthcare delivery in the USA and in championing the support of science and its impact on the future of medicine.

No matter the pace or process of healthcare reform nationally, we have an obligation to assume a leadership role in our community – with the equal goal of addressing healthcare delivery with a level of excellence that is seen as valued among our academic peers. As I have stressed in prior communications, this means focusing on “patient-centered care” (see: http://deansnewsletter.stanford.edu/archive/12_01_08.html#1 and http://deansnewsletter.stanford.edu/archive/07_26_10.html#7 and http://deansnewsletter.stanford.edu/archive/10_25_10.html#1). This means having physicians who are highly regarded in our community serving as resources for patient care as well as innovation and discovery. And we need to devote much greater attention to professionalism and compassion in the practice of medicine. These efforts should be further enhanced by the integrated clinical planning efforts we have initiated with SHC around clinical service lines. This process will continue through 2011.

We also need to stay focused on delivering the highest quality of evidence-based patient care and to do so in an effective manner as measured in comparative terms. This is an area where we have made considerable progress in the past several years (see: http://deansnewsletter.stanford.edu/archive/11_22_10.html#2). Furthermore, we need to do all we can to improve the experience of the patients receiving care at Stanford – from physicians and nurses to all members of the healthcare team. This is an area that needs work but where are we now putting considerable energy and where I also believe we will make greater strides with the recruitment of Amir Rubin as the SHC CEO. His track record in improving the patient experience at UCLA has won accolades and is something we all hope to benefit from when he joins Stanford on January 3rd (see: http://deansnewsletter.stanford.edu/archive/11_22_10.html#1).

And finally, we have to demonstrate the “value-added” of our academic medical enterprise in a manner that makes the cost of care “worth the price” based on the excellence, quality and delivery compared to alternatives. Achieving these and additional goals means putting significant attention into improving the excellence of healthcare delivery and will require re-engineering our

health delivery models, something in which academic medical centers can play a major role. Indeed, the recruitment of Dr. Arnold Milstein this past summer to lead our Clinical Excellence Research Center catalyzed our efforts in this area. I am convinced that, by working with the hospitals, School of Medicine faculty and faculty in the Schools of Engineering and Business, we can make a difference in how we deliver clinical care. This won't happen instantaneously – but I am confident it will take place over the next several years and that, as a result, we will play an important role in leading the future of healthcare delivery reform.

In addition to our important roles in research and patient care, we have also begun the journey of examining and seeking ways to improve our education programs – for medical and graduate students as well as residents, clinical fellows and postdoctoral scholars (see:

- **medical student education** - http://deansnewsletter.stanford.edu/archive/09_13_10.html#1;
- **graduate student education** - http://deansnewsletter.stanford.edu/archive/10_11_10.html#3;
- **postdoctoral training** - http://deansnewsletter.stanford.edu/archive/07_26_10.html#2).

I have detailed some of the starting points in these recent newsletters and note here that the next step will take place at our Annual Strategic Planning Leadership Retreat on January 21-22nd.

By being proactive and finding ways to shape the future of academic medicine, rather than just reacting to the financial, programmatic and policy changes that now abound, we have an opportunity to lead rather than follow. I will speak more to this agenda as we begin 2011. In the meantime, I wish you all well for the coming winter break and hope you arrive refreshed in January and ready to take on the many important opportunities and challenges that lie ahead.

A Time for Resolutions

The ending of one year and beginning of the next is frequently a time for personal resolutions – often ones dealing with health and well-being. Often “smokers” resolve to give up tobacco use in the “new year.” As you know, in 2007 the School of Medicine gave up tobacco by instituting a “No Smoking Policy” throughout its campus. This policy was subsequently extended to both Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital – so that the Stanford Medical Center is now completely smoke free. This is both a good policy and a good message for promoting health. Accordingly, I was pleased to receive an unsolicited email from a member of our community about the personal impact of the smoking ban. With permission I share the email with you:

"Dear Dean Pizzo,

Never thought I would say this, but thanks for helping me be smoke free after 20 years. Three years ago I went to the hospital to smoke when you banned it on school grounds....how ironic. But when the ban went up at Stanford Hospital at the end of last year, I resented it...but took it as a sign. Time to stop. After Thanksgiving of last year I quit smoking and have been smoke free since. I still see some of my fellow smokers from time to time in passing and the question always comes up? Where do you go to smoke? I can say at least 4 folks have told me they have quit as well. Not bad Dean!

Apparently making smoking socially unacceptable works. Thanks for the excuse to not to smoke anymore.

Here's to a longer, healthier life! Happy Holidays and New Year!"

Of course it is not as simple as a policy and signage. Giving up tobacco requires support, courage and fortitude. The smoking cessation programs offered at Stanford Hospital (see: <http://stanfordhospital.org/forPatients/patientServices/smokingCessation.html>) or as part of the Be Well@Stanford, and other programs as well, can provide the tools and resources to stop smoking. My hope is that other members of the Stanford community will follow the same path as the individual who sent me the email recorded above. Every individual who gives up smoking or tobacco use makes a positive affirmation for health. And promoting health is a primary mission of Stanford Medicine – this year and for all that follow.

A Time for Affirming Our Industry Interactions Policy

Although it seems implausible, I suppose it is possible that a Stanford faculty member might still be unaware of the School of Medicine Policies on Academic Industry Relationships. These policies are listed on our available website (see: <http://med.stanford.edu/coi/siip/>), have been widely disseminated, and I have communicated about them frequently as changes have taken place over years. Here's just a sampling of some of those communications over years:

- ***Academic-Industry Guidelines Coming Soon:***http://deansnewsletter.stanford.edu/archive/05_01_06.html#3
- ***Moving Toward a Final Resolution of a Medical Center Policy on Stanford-Industry Interactions:*** http://deansnewsletter.stanford.edu/archive/06_26_06.html#1
- ***Engaging in a National Dialogue on Conflict of Interest:***http://deansnewsletter.stanford.edu/archive/09_25_06.html#6
- ***Getting the Facts on Conflicts of Interest:***http://deansnewsletter.stanford.edu/archive/july_06.html#1
- ***Industry Relations and Conflicts of Interest:***http://deansnewsletter.stanford.edu/archive/04_23_07.html#6
- ***Professional and Personal Ethics: A Continuing Discussion:***http://deansnewsletter.stanford.edu/archive/11_19_07.html#b
- ***COI Features Prominently at the Annual Meeting of the AAMC:***http://deansnewsletter.stanford.edu/archive/11_03_08.html#7
- ***Updating Policies on Stanford Industry Relations:***http://deansnewsletter.stanford.edu/archive/12_15_08.html#4
- ***A New Policy on the Use of Industry Support for Continuing Medical Education (CME):***http://deansnewsletter.stanford.edu/archive/08_25_08.html#1
- ***Public Transparency on Industry Relations:***http://deansnewsletter.stanford.edu/archive/03_30_09.html#6
- ***The Institute of Medicine and Conflict of Interest: Catching Up to Stanford University:*** http://deansnewsletter.stanford.edu/archive/05_11_09.html#2
- ***Stanford and Industry Relations:***http://deansnewsletter.stanford.edu/archive/10_12_09.html#3

- ***Public Disclosure of Academic Industry Relations:***
http://deansnewsletter.stanford.edu/archive/11_09_09.html#1
- ***We Value and Appreciate our Adjunct Clinical Faculty:***http://deansnewsletter.stanford.edu/archive/04_05_10.html#1
- ***Conflict of Interest and Professional Societies:***
http://deansnewsletter.stanford.edu/archive/05_03_10.html#8
- ***Conflict of Interest in Clinical Care Policies Further Codified by the AAMC:***http://deansnewsletter.stanford.edu/archive/07_26_10.html#5
- ***Advancing Innovation Through Dialogues with Academia, Regulatory Agencies, Industry and the Public:*** http://deansnewsletter.stanford.edu/archive/10_11_10.html#2

Why am I focusing on this issue and some of my past communications about academic industry relations now? In 2010, the Congress passed legislation that requires pharmaceutical companies to disclose all payments to doctors by 2013. Seven pharmaceutical firms are now doing so, and the databases for these companies are publicly available. ***ProPublica***, an independent, non-profit online investigative newsroom that produces journalism in the public interest, has been utilizing these databases and is running a series entitled, *Dollars for Docs, What Drug Companies are Paying Your Doctor* (<http://www.propublica.org/topic/dollars-for-doctors>).

We have been informed that very shortly, ***ProPublica*** will be releasing a new investigation about how pharmaceutical firms have paid academic researchers and clinicians to participate in speakers' bureaus that market their products. Unfortunately, a small number of our faculty will be highlighted in this article.

Our preliminary investigation suggests that some of the individuals likely to be reported by ***ProPublica*** had understandable reasons for confusion about Stanford's policies and have already addressed them and ceased activities like "speakers' bureau" participation. Others, though, offered explanations why their activities continued that are difficult if not impossible to reconcile with our policy, and here we have concerns. I am fully cognizant that changes of the type we have witnessed in academic-industry relations and related conflicts of interest take time to disseminate and also to result in changes in behavior and activity. But, as noted above, there have been a lot of prior communications about the policies at Stanford and many stories in the lay and medical press about the problems associated with physicians serving in marketing roles. This is unacceptable, certainly for anyone with a Stanford title.

It is possible that some readers of this Newsletter are still be engaged in activities that violate Stanford policies. Of course I hope that is not the case. Over the next year we anticipate that a number of additional drug and device companies will publicly report physicians whom they have paid for various activities. It is important to take notice now; if, for whatever reason, you are still engaged in activities that will be seen as violations of Stanford policy, it is important that you cease them immediately. I would also encourage you to voluntarily report any activities you think may be questionable to Dr. Harry Greenberg (harry.greenberg@stanford.edu) or Barbara Flynn (bflynn@stanford.edu) so that you can receive assistance or guidance in how or whether to resolve them. Needless to say, violations of these policies can result in disciplinary actions. So, it is time to reaffirm a commitment, individually and collectively, to assuring the public trust in our

relations with industry. We are eager to support productive and valuable scientific interactions with industry as long as they do not involve marketing, are fully disclosed and adhere to our policies.

Some Recent Notable Events

- ***Under One Umbrella (Take Two):*** When our community unites around us, tremendous progress can be made. This is most certainly the situation with “Under One Umbrella,” a campaign for the Stanford Women’s Cancer Center that began last year with a benefit led by Nicole Kidman and Keith Urban. This year Ms. Kidman has served as Honorary Chair and an exceptional group of community leaders led by Ms. Lisa Schatz has brought a second wonderful “Under One Umbrella” event to fruition. The Committee of community leaders includes Deborah Berek, Fran Codispoti, Ann Doerr, Susie Fox, Jill Freidenrich, Lainie Garrick, Lisa Goldman, Laurie Lacob, Jillian Manus-Salzman, Debbie Rachleff and Diane Taube. Through their efforts, the vision for treating and preventing cancer in women is being led by Dr. Jonathan Berek, Professor and Chair of the Department of Obstetrics and Gynecology, and Dr. Bev Mitchell, Director of the Stanford Cancer Institute and the George Becker Professor in the Department of Medicine. The Committee brought together hundreds of supporters who raised nearly \$1 million for the Stanford Women’s Cancer Center and celebrated their commitment and success with a special concert by Trisha Yearwood and Garth Brooks. It was quite an event in its own right but most importantly, it was an affirmation that Stanford and the community it serves is committed to improving the lives of women facing the challenge of cancer. We are all “Under One Umbrella.”
- ***A Step Forward on Principle Investigator Status for Young Physician-Scientists.*** Given the coverage in the Stanford Report you have likely heard this good news. But in case you haven’t heard, I am very pleased to tell you that the University Faculty Senate, at its December 2nd meeting, approved a proposal from the Committee on Research that will allow a selected number of clinical fellows and postdoctoral scholars holding MD or MD/PhD degrees to apply, on a one-time only basis, to serve as principal investigators (PIs) on externally funded grants. The proposal is for a four-year trial period, during which the School’s experience will be monitored. At the end of the trial period, a decision will be made about continuing this eligibility, expanding it to PhD postdoctoral scholars, or ending it. The December 6 online Stanford News story on the Senate discussion is quite informative, and I recommend it (<http://news.stanford.edu/news/2010/december/faculty-senate-four-120610.html>).

While this approval may look on the outside like a relatively minor change, it is actually quite significant. Perhaps some background would be helpful to understand why. Under current – and long-standing – Stanford policy, acting as PI on an externally funded research project is a privilege limited to members of the Academic Council and to the Medical Center Line faculty. The rationale for this restriction is the importance of PIs – as the Research Policy Handbook (<http://rph.stanford.edu/2-4.html>) says, they are “responsible for determining the intellectual direction of the research and scholarship and

for the training of graduate students,” and this role appropriately belongs to these groups of faculty.

However, the policy does make room for exceptions on a case-by-case basis.

Currently, there are four categories of exceptions: career development awards; specific projects that are part of large interdisciplinary programs; conferences, exhibits, workshops or public events; and other, rare, non-recurring situations subject to the approval of the dean of research. The proposal that passed the Senate extends the definition of "career development awards" to include an initial RO1-like grant "in order to enhance and advance the training and competitiveness of our clinical fellows and MD postdoctoral trainees as they seek their initial academic positions."

Up to ten MD postdocs per year may submit an application under this exception. They must have two or more years of research training, and they must have the written agreement of their faculty mentor, department chair and the Dean's Office. Also, the faculty mentor and department chair are required to document that the individual will be assigned the appropriate space and other resources necessary to support the work described in the grant application for the duration of the grant period, should it be awarded. Specific instructions for submission are being developed and will be available early in the new year.

The rationale for focusing on MD postdocs for this trial period relates to the special challenges faced by physician scientists headed toward academic careers as well as the diminishing number of physician scientists nationally, which is a growing concern. I have discussed these issues in previous newsletter articles (http://deansnewsletter.stanford.edu/archive/11_19_07.html).

- ***A New View on Secondary Faculty Appointments in the Medical School:*** Secondary appointments are used in the School of Medicine as a way of encouraging and acknowledging significant interactions that faculty have with departments other than their home department. Unlike true joint appointments, in which a faculty member's billet and salary are split between two departments (as is done in other parts of the University), in the School of Medicine the billet and salary remain in the home department for those holding in secondary appointments. However, the faculty member is still viewed as a *bona fide* member of the secondary department and has the right to vote in that department as well as in the home department. The courtesy appointment is yet a third category of affiliation. It recognizes an important connection with another department but does not confer voting rights.

You will not be surprised to learn that these distinctions are interpreted differently in different departments and over time – and that these appointments are valued differently across the school. In fact, early in my tenure as Dean and as long ago as 2003, we discussed at an Executive Committee Meeting some of the advantages and disadvantages of these appointments (http://deansnewsletter.stanford.edu/archive/12_08_03.html). In a nutshell, these types of appointments can foster the kinds of interdisciplinary interactions that we want to enhance. On the other hand, especially in small departments, secondary appointees, if they constitute a significant percentage of the voting faculty, can

alter the department's decision making in ways that might not be consistent with the primary faculty's views. They may also be seen to dilute the focus of the department. Even so, there are many fruitful and longstanding secondary appointment arrangements in the School, and we certainly want to continue to encourage them when appropriate.

Earlier this year the Executive Committee took up this topic again. At the March 19 meeting, Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, clarified the definitions of these appointments. He noted that, currently, secondary faculty vote in some departments and not others and that, when asked, some secondary appointees did not know whether or not they had voting rights. The question was raised of whether secondary appointments should carry voting rights at all. There is also some confusion about what courtesy appointments entail.

Dr. Stevenson also noted that secondary appointments for senior faculty are like their primary appointments in that they have no end date. He raised the question of whether secondary appointments should be for terms of years. This would give the departments an opportunity, on a periodic basis, to reassess the ongoing involvement of the faculty member and determine whether a secondary appointment was still appropriate or whether a courtesy appointment would be preferable.

The Committee had further discussion of this question early this fall, and the Office of Academic Affairs surveyed secondary appointment holders for their input. At the December 3rd meeting, Dr. Stevenson presented a proposal that reflected the Committee's prior discussions as well as the results of the survey. The Executive Committee endorsed the proposal, which has the following elements:

- **Secondary appointments**
 - ***Voting***: the voting privilege will be preserved, since it is valued highly by many faculty
 - ***Defining secondary appointments***: Departments should define an expected level of involvement that is significant enough to merit voting rights and determine whether current (and potential) secondary faculty meets that threshold. In cases where engagement with the secondary department is less substantive and the programmatic need less compelling, appointment to a courtesy position should be considered as an option.
 - ***Term appointments***: In order to provide departments with maximum flexibility, the School will be proceeding with instituting five-year renewable terms for tenured faculty or those on continuing term. Exceptions will be granted on a case-by-case basis.
- **Courtesy appointments**: Formally (that is, in all appointment documents), the title should include the "by courtesy" designation. In everyday usage, this designation may be dropped.

The Office of Academic Affairs has communicated with department chairs and with each holder of a secondary appointment about these changes and the timeline for their implementation. I am pleased that we now have greater clarity about these types of appointments and a department-based process for assuring that faculty engagement across departments reflects their contributions. My thanks to Dr. Stevenson for taking the lead on this important but sometimes contentious issue and to the Executive Committee for their thoughtful deliberations.

- **Honoring Jill and John Freidenrich:** Since 1953 Stanford University has awarded the Degree of Uncommon Man and Woman “to recognize rare and extraordinary service to the university.” The spirit of the award is derived from the remarks of President Herbert Hoover: *“Let us remember that the great human advances have not been brought about by mediocre men and women. They were brought about by distinctly uncommon men and women with vital sparks of leadership”*. On Friday December 10th President John Hennessy, on behalf of the Stanford Associates, conferred the degree of the Uncommon Man and Woman on **John, '59, LLB '63 and Jill, '63 Freidenrich**.

My wife Peggy and I were honored to be part of the evening's festivities and events. Hundreds of family, friends, faculty and colleagues joined the celebration, each having their own personal perspectives and stories on John and Jill Freidenrich. For us, they are a truly remarkable and incredible couple, epitomizing the deep commitment and devotion to the university and medical center. In doing so, they carry out their work selflessly and never seeking attention or recognition. But they do so with the highest integrity, always seeking to make Stanford better and to help each of us become more effective and meaningful members of our community. We are inspired by them and are so pleased they have received this highest of recognition. True to form they directed the recognition to others and in doing so, continue to call us to a higher order, an uncommon one.

Awards and Honors

Dr. Ahmad Salehi, Clinical Associate Professor (Affiliated) in the Department of Psychiatry and Behavioral Sciences, has just received the World Technology Award in the field of Biotechnology by the World Technology Network (WTN). Congratulations, Dr. Salehi.

Appointments and Promotions

Olga Albert has been reappointed to Clinical Assistant Professor of Anesthesia, effective 1/1/2011.

Cheryl Ambler has been appointed to Clinical Assistant Professor of Neurology & Neurological Sciences, effective 11/1/2010.

Robert T. Chang has been appointed to Assistant Professor of Ophthalmology at the Stanford University Medical Center, effective 11/01/10.

Samuel Cheshier has been appointed to Assistant Professor of Neurosurgery and, by courtesy, of Neurology and Neurological Sciences at the Lucile Salter Packard Children's Hospital, effective 11/01/10.

Talmadge (Ted) Cooper has been to Clinical Associate Professor of Ophthalmology, effective 11/16/2010.

Markus W. Covert has been reappointed to Assistant Professor of Bioengineering, effective 1/1/2011.

Lisa Diamond has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 7/1/2010.

Jennifer Domingo has been reappointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2010.

Shahinoor Esmail has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 12/1/2010.

Gordon G. Gao has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2009.

Gus Garmel has been promoted to Clinical Professor (Affiliated) of Surgery, effective 12/1/2010.

Sara Goldhaber-Fiebert has been promoted to Clinical Assistant Professor of Anesthesia, effective 1/1/2011.

Kathleen M. Gutierrez has been promotions to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital effective 11/01/10.

Aida Habtezion has been appointed to Assistant Professor of Medicine, effective 12/1/2010.

Paul A. Heidenreich has been promoted to Professor of Medicine and, by courtesy, of Health Research and Policy, at the Veterans Affairs Palo Alto Health Care System, effective 11/01/10.

Steven K. Howard has been reappointed to Associate Professor of Anesthesia at the Veterans Affairs Palo Alto Health Care System, effective 11/01/10.

Yusra Hussain has been promoted to Clinical Assistant Professor of Medicine, effective 10/1/2010.

Stephanie Kolakowsky-Hayner has been appointed to Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 12/1/2010.

Vivekanand Kulkarni has been promoted to Clinical Associate Professor of Anesthesia, effective 1/1/2011.

Clete A. Kushida has been promoted to Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 11/01/10.

Parag Mallick has been appointed to Assistant Professor (Research) of Radiology, effective 1/1/2011.

Margaret Marnell has been reappointed to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 10/1/2010.

Yvonne Morris has been reappointed to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 9/1/2010.

Joel Neal has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 11/01/10.

Natalie Pageler has been appointed to Clinical Assistant Professor of Pediatrics, effective 12/1/2010.

Benjamin Pinsky has been appointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 11/01/10.

George A. Poultides has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 11/01/10.

Ali Rezaee has been reappointed to Clinical Assistant Professor (Affiliated) of Otolaryngology/Head & Neck Surgery, effective 1/1/2011.

Chris F. Snow has been reinstated to Clinical Professor (Affiliated) of Medicine, effective 6/1/2010.

Scott G. Soltys has been reappointed to Clinical Assistant Professor of Radiation Oncology, effective 9/1/2010.

Naiyi Sun has been promoted to Clinical Assistant Professor of Anesthesia, effective 1/1/2011.

Maurene Viele has been reappointed to Clinical Associate Professor of Pathology, effective 10/16/2010.

Trevor Winter has been appointed to Clinical Associate Professor of Medicine, effective 11/1/2010.

Dean's Newsletter

January 10, 2011

A Challenging But Still Hopeful New Year

The December issue of *Academic Medicine* (see:

<http://journals.lww.com/academicmedicine/toc/2010/12000>) featured a series of articles on the twice-failed merger(s) of Mount Sinai and New York University Medical Schools and Medical Centers. It's a story that evokes many memories for us at Stanford, of course, because of the attempt in the mid-1990s to merge our clinical programs with those of the University of California, San Francisco. This too turned out to be a failed experiment. Years later all four medical schools (those in New York and in northern California)– and their associated academic medical centers – are thriving despite the financial and related damage that took place to each during the merger and demerger processes. Many of you will remember with various degrees of emotion the days during and following the UCSF-Stanford merger. I arrived during the final stages of the un-wind and recall vividly the damaged morale, unclear direction and significant financial losses I found, especially at Stanford Hospital & Clinics (SHC). Now, nearly a decade later, thanks to the work and efforts of many of you, the situation is dramatically changed. Stanford Medicine is robust and thriving across its multiple missions and by every metric is among the very best of research-intensive schools of medicine.

However, resting on past (even recent) success is not compatible with the rapidly changing dynamics impacting higher education in general and medical schools and academic medical centers more specifically. During the past decade many of our peers grew in size and scope of their faculty and facilities, both in research and clinical medicine. The overall size of NIH funding, faculty numbers, or clinical volumes (especially for high-end inpatient procedure-based services) also became surrogates for success at many institutions – a strategy that is increasingly problematic. Indeed, the flaws in this strategy began to surface with the economic meltdown that began in 2008, which affected endowment investments along with state and federal financial resources. We are all cognizant of the efforts to reverse the economic downturn but are also painfully aware of its lingering consequences, which are now being played out on the big Washington stage.

For instance, we are currently witnessing the emerging debates on the debt ceiling and on flat funding or potential roll-backs of federal funding to both discretionary programs (which includes agencies like the NIH) and entitlement programs, with major concerns about Medicare and Medicaid). Despite the rhetoric of attempts to repeal the Affordable Care Act of 2010, the likelihood of this happening in any significant manner is small, but clarity about what reforms will actually take place and when will clearly be even more political than the repeal effort (if that is possible). The report in the *New York Times* on January 5th (<http://www.nytimes.com/2011/01/05/health/policy/05health.html?scp=1&sq=medicare%20planning&st=cse>) that the Obama Administration will delete the requirement for end-of-life counseling during an annual visit of Medicare recipients is one example – and an unfortunate one at that, since anticipatory planning about “advanced directives” is good medicine and something that should be encouraged – not for financial reasons but because it is good medicine.

On Friday, January 7th Marcia Cohen, Senior Associate Dean for Finance and Administration, presented the annual report on the financial status of the School of Medicine. I would like to

begin by thanking Marcia and her team led by Sam Zelch, Chief Financial Officer and Assistant Dean for Fiscal Affairs, along with the finance group, for the work they did in preparing the current analysis and, more importantly, for the contributions they have made during the tumultuous years since the financial meltdown in 2008.

I am quite aware that a number of the decisions we felt compelled to make were not popular and several were poorly received at the time. But the reality is that they helped to stabilize a deteriorating financial situation. More importantly, even with the major projects we have undertaken in the past years, the financial state of the School of Medicine is quite sound and is likely among the best in the nation. Given the major challenges that lie ahead, this is extremely important. Put another way, the pain and distress of the past years – and even the discord that erupted from time to time – were, in hindsight, part of a larger process of recovery that has brought us to a very positive current state. I will give just a few highlights, starting with the proverbial bottom line: the School of Medicine's consolidated revenue exceeded expenses for FY10 (the year that closed on August 31, 2010) by \$46 million. This is an improvement over the consolidated performance for FY09 (\$34 million) as well as the FY11 budget (projected as \$35 million).

These results reflect the impact of expense reductions as well as increases in revenues. The expense reduction related primarily to the cost controls and programmatic reductions that were made during the past two years, particularly in the School's central administrative offices. Coupled with these reductions have been important revenue gains in both sponsored research and clinical activity. Notably, total research expenditures (direct and indirect) increased from \$385 million in FY09 to \$455 million in FY10 – an 18% increase. Importantly, the increase in sponsored research in FY10 was 7.9% without ARRA (American Reinvestment and Recovery Act) funding, which is truly remarkable and is a great tribute to the excellence of our faculty. In addition, clinical activity and payments have also increased during the past several years. In fact, between FY05 and FY10 the net clinical operating revenues increased by an average of 11% per year, permitting every clinical department to have net positive contribution from clinical operations in FY 2010.

In addition to clinical and research activity, endowment and expendable reserve balances have shown signs of recovery since 2008 – despite the overall economic challenges in the nation. This is also a reflection of the knowledge and skills of the Stanford Management Company, among others. For example, as of August 31, 2010 the consolidated endowment of the School of Medicine increased by 11% to \$1.856 billion. However, this is still below the FY08 pre-crash endowment value of \$2.277 billion. Of course, most of the endowment is restricted and proportionally distributed among the school's central units (40%), student aid (11%), departments or divisions (21%) and faculty or principal investigator (24%). Concurrently, the consolidated expendable reserves for the medical school in FY10 was \$522.8 million, of which \$41% are in departments, divisions or programs and another 22% with faculty or PIs. For FY10, 31% of the expendable reserves were held centrally.

Certainly the results described for FY10 are highly encouraging, and they will permit us to weather the storm clouds ahead. But those storm clouds loom large and potentially damaging. They include the almost certain reductions in federal support for sponsored research, the

potential decreases in stem cell research funding by FY17 unless Proposition 71 is renewed, the impact of the economic downturn on state economic support – which is truly serious in California– and the pending changes in clinical revenues to physicians and hospitals as a consequence of the rapidly changing healthcare landscape. As I noted in the December 13, 2010 *Dean's Newsletter*, “By being proactive and finding ways to shape the future of academic medicine, rather than just reacting to the financial, programmatic and policy changes that now abound, we have an opportunity to lead rather than follow” (<http://deansnewsletter.stanford.edu/#2>).

Given the important challenges that lie ahead across all of our critical missions, I want to share some of the strategic initiatives underway that will hopefully mitigate or help remedy some of these important issues. Rather than narrative details I will simply offer more of a “table of contents” formulation – recognizing the numerous uncertainties that exist. This is not meant to be an inclusive or exhaustive list, and it is likely that a number of additional areas will need to be explored – and some of the paths we have taken may need to be altered or redirected. I recognize that some of these comments are straightforward and fully recognized, that many refer to programs underway and that some will be viewed as controversial or negative.

1. Responses and Reactions to the Impact of Healthcare Finance and Reform

- Continued attention on the critical factors that will differentiate Stanford Medicine from other healthcare providers and systems. These represent our fundamental underpinnings and opportunities for distinction, and we must achieve outstanding and sustained performance in each one. These areas have been reviewed in past Newsletters (see: (http://deansnewsletter.stanford.edu/archive/12_01_08.html#1 and http://deansnewsletter.stanford.edu/archive/07_26_10.html#7 and http://deansnewsletter.stanford.edu/archive/10_25_10.html#1) and include:
 - Leadership in innovation and discovery
 - Availability and accessibility to outstanding medical providers
 - Superiority in clinical quality and safety
 - Outstanding patient service experience
 - Defined evidence of cost benefit and a value proposition
- Joint planning on how Stanford Medicine will assess and address the changes unfolding in clinical medicine as a consequence of healthcare reform and the changing medical marketplace. A new committee engaging hospital and school leaders has recently been established for this purpose.
- Preparation for the shift of clinical reimbursements from volume and RVUs to measures of quality, safety and service. A component of this is the likely (and in my opinion welcome) shift from the perverse incentives that have been tied to the still current fee-for-service reimbursement system. That said, these changes will have considerable impact on hospital and physician revenues over time.
- More balanced focus on the delivery of care in ambulatory, community and home settings. These efforts should be advanced in time by the new Clinical

Effectiveness Research Center, which is jointly supported by the School of Medicine and SHC.

- Preparation for decreased support for Graduate Medical Education through Medicare – which will likely lead to lower payments as well as a shift toward ambulatory training in place of the current high level of inpatient service and education. This has important implications for the physician workforce as well as the cost and provider models for inpatient care.
 - Another important issue impacting resident service is the new work hour limits that will become even more restrictive in 2011-2012 and that will require additional accommodations by clinical departments and service lines.
- A critical appraisal of our primary care services (including areas like geriatric care) and an assessment by clinical department leaders of the breadth and depth of their clinical services.
- Development of improved community programs and networks through regional collaborations and interactions that are departmental or clinical service line based or that are aligned through the newly established University Health Associates (whose governing Members are the School of Medicine, SHC and LPCH).
- Preparedness to develop an Accountable Care Organization (ACO). The organization and design of this new entity will be announced in the coming month, and it will be established in 2012. This will require risk-based management of populations of patients.
- A critical assessment of current or planned investments in facilities as well as programs. This needs to be done across the Medical Center, and it needs to include a reassessment of the assumptions that have guided projections in inpatient bed-capacity, numbers of faculty and clinical providers and our constant efforts to balance and preserve our excellence in research and education as well as in the delivery of patient care.
- Continued attention to the integrated strategic planning underway with the Medical School, SHC and LPCH. At this point the integrated plan on cardiovascular services is close to completion, and the joint planning efforts in cancer care are commencing, with those for neuroscience to follow this spring.
- Investment in clinical leaders and faculty. This includes the recruitment of clinical faculty and department chairs (four searches are currently underway). In tandem we need to continue our efforts in faculty and leadership development across the medical center.
- Exploration of ways of making the work environment more successful through novel work arrangements that permit greater flexibility while not compromising career development.

2. ***Responses and Possible Remedies to Impact of Flat or Declining Support for Biomedical Research.*** This will be an area of focused discussion at the School of Medicine Strategic Leadership Retreat on January 21-22, and updates of those discussion will be included in future Newsletters. As noted above and in other presentations, it is increasingly clear that funding from the NIH will almost certainly be flat for the next

years – meaning that there will be a loss of purchasing power as well as increased competition for grants.

- Certainly among our highest priorities must be support for current faculty including:
 - Raising gifts for professorships for senior faculty and research support for junior faculty.
 - Diversifying where possible the sources of research funding (e.g., foundations and industry) in addition to continuing to seek traditional sponsored research funding.
 - Continuing the bridge fund program (in conjunction with basic and clinical departments) to support faculty who encounter acute or unexpected funding shortfalls where recovery of funding is anticipated.
 - Assuring that recruitment of research faculty continues to focus on the highest quality and potential for future success and that we are able to support new faculty as they begin the careers or transition to Stanford.
- Optimizing the utilization of research space; this may require more shared space configurations (as has been long done in the Department of Biochemistry) along with careful examination of the size of a PI's research group (including graduate students and postdocs) based on current and projected funding.
- Optimizing the balance between on-campus versus off-campus space based on the type of research being conducted and the availability of space for lease.
- At the same time we still have to address critical on-site research needs that include the planning for the Foundations in Medicine building (FIM) and the Bioengineering Building as well as on-campus and off-campus animal space.
- Critical reappraisal of the research cores including their location, management and funding models.

3. ***Thoughts About the Changing Environment and Education and Training.*** The future of medical and graduate student and postdoctoral training will also be a major focus at the Strategic Leadership Retreat. I have outlined some of the major issues we hope to address in recent Newsletters: medical student education (http://deansnewsletter.stanford.edu/archive/09_13_10.html#1); graduate student education (http://deansnewsletter.stanford.edu/archive/10_11_10.html#3); postdoctoral training (http://deansnewsletter.stanford.edu/archive/07_26_10.html#2). Clearly we will need to focus on the size and scope of our education programs, the expectations (real and perceived) for our graduates and the sources of support to permit our programs to be successful. Of course, this includes the cost of education as well as the education expenses for students and for our faculty and departments. Increasingly we will want to frame these opportunities on a global basis – given the composition of our students and trainees, the areas for future opportunity and our burgeoning programs and interests in global health.

The challenges we face in the areas noted above, and many others not included in this discussion, are numerous and significant. There is no question that the next couple of years will shape Stanford Medicine for many years and even decades to come. But we can draw comfort and confidence from the positive results we have achieved to date and the very fact that we are

thinking critically and proactively about the future and the shared commitment we have to be leaders in the transformation of science and medicine in the 21st century.

Faculty Mini-Grants for Teaching and Learning Technologies

The Simulation & EdTech (SET) group, part of our Information Resources and Technology Office, is again offering mini-grants to faculty of up to \$2,000 for 2011 to develop, implement, and evaluate learning technologies. The applications (1-2 pages) are due on January 17, 2011. More information is on the website <http://med.stanford.edu/irt/teaching/minigrants.html> or contact Brian Tobin, Instructional Technology Manager, btobin@stanford.edu.

Upcoming Event

Stanford Health Policy Forum

Methamphetamine: An American Epidemic

Wednesday, January 19, 2011
11:30 AM to 1:00 PM
Paul Berg Hall, 230A
Li Ka Shing Center
291 Campus Drive, Stanford University

This Stanford Health Policy Forum will focus on the ravages of methamphetamine in the United States and how policymakers should respond to the epidemic. In a conversation with the speakers and the audience, this forum will examine methamphetamine's addictive power, its impact on individuals and communities, and how drug policy and economic policy can support the efforts of families and health professionals to reduce the terrible impacts of the drug.

A conversation with:

Nick Reding

Best-selling author of "Methland: The Death and Life of an American Small Town"

Keith Humphreys

Professor of Psychiatry and Behavioral Sciences
Stanford University
Former Senior Policy Advisor
White House Office of National Drug Control Policy
Senior Research Career Scientist
Veteran's Affairs Health Care System

Moderated by

Paul Costello

Chief Communications Officer, Office of Communication and Public Affairs,
Stanford School of Medicine

This forum is free and open to the public
Space is limited to the first 100 people

For more information, please visit [HTTP://Healthpolicyforum.stanford.edu](http://Healthpolicyforum.stanford.edu)
or call 650-725-3320

Awards and Honors

- **Julieta Gabiola**, clinical associate professor of general internal medicine, is the recipient of the American College of Physicians (ACP) Northern California Chapter's Faculty Award for Volunteerism. Presented at their recent annual meeting in San Francisco. Dr. Gabiola led a successful medical mission to Iloilo, Philippines in January 2010. This consisted of a group of 70 volunteers consisting of faculty physicians, community physicians, dentists, surgeons, and nurses from Stanford, Kaiser, Seton, and Mills Peninsula, who served a village with a population of about 60,000 people and saw 4,700 underserved patients in three days.
- **William Kuo**, assistant professor of vascular and interventional radiology and CV/interventional fellowship director, has been awarded the 2011 Dr. Gary J. Becker Young Investigator Award by the Society of Interventional Radiology (SIR). Bestowed in honor of the founding editor of the *Journal of Vascular and Interventional Radiology (JVIR)*, this award "promotes excellence in academic research for members early in their careers" and recognizes "the importance of the young investigator in developing the interventional solutions for the future."

Appointments and Promotions

Preetha Basaviah has been reappointed as Clinical Associate Professor of Medicine, effective 2/1/2011.

Lucienne S. Bouvier has been appointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 1/1/2011.

Katherine L. Brubaker has been appointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 1/1/2011.

Thomas Bush has been reappointed as Clinical Professor (Affiliated) of Medicine, effective 8/1/2010.

Mina Charon has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 2/1/2010.

Clifford Chin has been reappointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 1/1/2011.

Alexander Chyorny has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 12/1/2010.

Waldo L. Concepcion has been promoted for a continuing term as Professor of Surgery at the Stanford University Medical Center, effective 12/1/2010.

Lisa Farah-Eways has been appointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 1/1/2011.

Rishad M. Faruqi has been promoted to Clinical Associate Professor (Affiliated) of Surgery, effective 12/1/2010.

Deborah Franzon has been reappointed as Clinical Assistant Professor of Pediatrics, 1/1/2011.

Ansgar Furst has been appointed as Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 2/1/2011.

Faezeh M. Ghaffari has been appointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 1/1/2011.

Cheryl E. Gore-Felton has been promoted for a continuing term as Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 12/1/2010.

Lawrence V. Hofmann has been reappointed to Associate Professor of Radiology at the Stanford University Medical Center, effective 2/1/2011.

William A. Kennedy has been reappointed to Associate Professor of Urology at the Stanford University Medical Center, effective 12/1/2010.

Quoc T.A. Luu has been reappointed as Clinical Assistant Professor of Radiation Oncology, effective 11/1/2010.

Edward R. Mariano has been appointed to Associate Professor of Anesthesia at the Veterans Affairs Palo Alto Health Care System, effective 12/1/2010.

Vibha Mohindra has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 10/1/2010.

Barbara L. Nicol has been appointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 1/1/2011.

Janelle Ogura has been appointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 1/1/2011.

Einar Ottestad has been promoted to Clinical Assistant Professor of Anesthesia, effective 1/1/2011.

Richard J. Reimer has been appointed to Associate Professor of Neurology and Neurological Sciences and, by courtesy, of Molecular and Cellular Physiology, at the Stanford University Medical Center, effective 12/1/2010.

John P. Siegel has been appointed as Clinical Assistant Professor (Affiliated) of Surgery, effective 1/1/2011.

Connie E. Teresi has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 4/1/2010.

Julie C. Weitlauf has been appointed as Clinical Associate Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 1/1/2011.

Marina Zelenko has been promoted to Clinical Associate Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 12/1/2010.

Dean's Newsletter

January 24, 2011

The 2011 Strategic Leadership Retreat: Change in a Time of Change

We held our Annual Strategic Planning Leadership Retreat on January 21-22nd at Chaminade, in Santa Cruz. This was the tenth consecutive Annual Retreat since I joined Stanford in 2001 and, as with past retreats, it offered the opportunity to bring our broad Stanford Medicine community together for reflection, debate and strategic planning. Over the years each retreat has had a different focus, and the theme as well as the consequences and outcomes have varied considerably. What has remained a constant is the opportunity to bring together our diverse community, share different perspectives and forge new alignments around our individual and collective futures.

As highlighted in the end of the 2010 and beginning of 2011 Newsletters (*"Some Reflections on 2010: A Times for Ups and Downs"* [see: http://deansnewsletter.stanford.edu/archive/12_13_10.html#2] and *"A Challenging But Still Hopeful Year"* [see: <http://deansnewsletter.stanford.edu/#1>]) we are moving through of time of change – some of which is predictable and much of which is considerably less so. We remain committed to our fundamental missions but recognize that we will need to remain visionary, creative, flexible and entrepreneurial to sustain success.

The major goal for the 2011 Retreat was to define our future initiatives in education in the context of the changing landscape of healthcare delivery and our nation's investment and opportunities in research. We also wanted to further refine our efforts to provide broad opportunities as well as flexibility in career development. To that end, we benefited from five panel presentations and the rich discussion that followed, which helped provide both a framework and greater clarity for the specific action items that will follow from the retreat. The panels were as follows:

Panel 1. Flexibility in Faculty Careers – A Mandate for Cultural Change

This panel included presentations by Drs. Hannah Valentine, Senior Associate Dean for Diversity and Leadership; Christy Sandborg, Chief-of-Staff at Lucile Packard Children's Hospital and Professor of Pediatrics; Jennifer Raymond, Associate Professor of Neurobiology; Ron Pearl, Professor and Chair of the Department of Anesthesia; and Udaya Patnaik, Founder and Principal, Jump Associates. Dr. Valentine began the panel by underscoring that the primary purpose of the task force she and Dr. Sandborg are leading is to create a culture that is supportive to career flexibility. While it is important to note that the School of Medicine has a number of existing policies that permit flexibility, the unfortunate reality is that most faculty do not take advantage of them. There is an accumulating concern that a culture that does not foster flexibility leads to turnover and discourages students and trainees from aspiring to or pursuing academic careers. If so, the consequences will be quite negative for the future of academic medicine. With that in mind, the task force is seeking to make the case for flexibility, identify best practices and define the needs of faculty.

The workforce and many work environments have changed over the past several decades. While there are clearly exceptions, there is a perception (which is supported by data) that a successful academic career is more achievable for men or for women who defer having children. This is not a reality we want to support or sustain.

The panel emphasized some of the important differences between basic and clinical science faculty in opportunities for flexibility. For example, basic science faculty may have more short-term flexibility but have less long-term flexibility compared to their clinical colleagues. This is related to the fact that basic science compensation is lower than for clinical faculty so that working part-time may not permit a livable wage. Further, the intense competition for research funding and the need to fund one's laboratory as well as salary means that if a faculty member reduces her or his time in research, it could prove impossible to sustain successful peer-reviewed research support, thus negatively affecting career development.

At the same time, it is also clear that there are lots of "jobs" that faculty do that, if done by others, would permit them to focus their attention on areas that are likely to have the biggest payoff for them both professionally and personally. Support for tasks from institutional resources, or greater salary support so that faculty were not as dependent on raising grant or clinical income, would be helpful in optimizing faculty time. In the end, time is the most precious resource for faculty, and currently it is deployed on both productive and less productive activities. Job sharing has been used in a number of industries, including in medicine, and can be successful, particularly when both partners share a common skill set. Understandably, it is more difficult when the patient population is very specialized and the skill set of the physician unique.

Another issue is defining what is actually meant in an academic setting by part time. Is part-time a portion of a 40, 60, 80 or more workweek hours? Also, how does one allocate time when one's job includes multiple activities (teaching, clinical, research, administrative, service)? Are all components of one's job reduced proportionally or are some simply eliminated? And in either case, what are the consequences to future promotion and career development, and how does this play out at the individual, division, and department level? It is also the case that individuals and faculty who are not participating in flexible hours are also affected by the choice or needs of their colleagues – and that they may respond with support or with anger and disdain. A change in the entire culture of an organization or even society may be required in order to achieve acceptance of flexible work schedules during different phases of career development. Examples were cited of cultures of flexibility in companies and even countries (e.g., The Netherlands).

Because the solutions to this issue are so challenging, the task force has engaged the firm of Jump Associates, who will work with them over the next year to create options. Jump Associates is a consulting group that focuses on solutions to highly ambiguous problems, in which the key first step is really fully identifying the problem. This step, which might seem relatively straightforward, is more complicated in an academic medical center than in many settings because of the diversity and breadth of jobs, the range of needs, the internal and external pressures and expectations at the individual and institutional level, and the limitation of the resources that are needed to attenuate the problem or even help permit creative solutions. Despite these challenges, solutions are needed lest the opportunities of future generations of physicians and scientists, particularly women, become adversely impacted or even squandered.

The Retreat participants engaged in a thoughtful discussion about how to overcome the current barriers and challenges and were asked to provide their written comments, which will be collated and codified to further inform the work of the task force. These and other inputs will guide the task force to more formal recommendations that they will bring forth over the next year. While it is clear that this is a very difficult problem, I did have the very definite sense that there is a strong willingness on the part of our school and institutional leaders to work toward solutions – a key first step.

Panel 2. The Evolving Landscape of Healthcare and Attempts to Reform or Change It

This panel was led by Dr. Arnie Milstein, Director of the Clinical Excellence Research Center and Professor of Medicine, and included Dr. Jay Battacharya, Associate Professor of Medicine; Dr. Woody Myers, Stanford Hospital and Clinics (SHC) Board of Directors and Stanford University Trustee Emeritus; and Dr. Kevin Tabb, Chief Medical Officer, SHC.

This panel began with a high-level review by Dr. Battacharya of some of the societal factors that allowed health care reform to happen now as compared to the many past failed efforts – at least to its current state of deployment. To a great extent the reform was driven by unsustainable rates of increase in the costs of care being borne by both the public and the private sectors. Coupled with this was the fact that more than 60 million Americans lack access to health care and that much of the care provided to uninsured people is paid for by those who have insurance. By 2014 this will be modulated by the availability of health coverage to approximately 35 million people through public programs (notably Medicaid) or through health insurance exchanges. At least a

part of this increased cost will come from proposed reductions in Medicare, but this will come with a price – both in the care for poor people and in the public support (through Medicare) for graduate medical education.

Clearly, these changes will have important implications for academic medical centers, which will likely see a shift of poorer paying patients to their care, an increased demand for services and a decreased support for the education and training missions of teaching hospitals. This will require changes in how academic medical centers carry out their work in patient care, education and research – with a larger focus on the management of populations and efforts to keep chronically ill patients out of high cost systems.

Dr. Arnie Milstein further reviewed some of the major implications of the Affordable Care Act (ACA) on academic medicine and highlighted two issues. The first is a projected shift of both public and private payers away from “fee-for-service” (which, parenthetically, has helped foster so many of the perverse incentives that are now featured in US healthcare) toward a payment system that will incentivize higher quality (based on comparative metrics) and lower costs. Secondly, as noted above, there will be a tighter linkage between any payments for graduate medical education (through Medicare) and evidence that the future physician workforce is able to work effectively and efficiently in the new and rapidly evolving quality/cost driven healthcare environment.

Dr. Myers, speaking from his perspective as a hospital Board of Directors member (and former leader of a major private insurance company), opined that, while the ACA is hardly perfect, it is a great start. He observed that Stanford Medicine has a number of things in its favor, including major improvements in recent years in our demonstrable quality and safety scores (to the point where we are now among the leading institutions in the country); a fully deployed electronic medical record system (also featured as one of the best in the nation); a major cultural shift toward disclosure and a culture that values integrity and the public trust; and a solid reputation and brand as Stanford Medicine (which can be built on and enhanced in the years ahead).

Dr. Myers also noted some major challenges, including the need to better define and then deploy our mission in primary care that will complement our excellent tertiary services; the regional challenges of distinguishing Stanford Medicine from the other major providers in the Bay Area (e.g., Kaiser and Sutter) that are increasingly consolidating the healthcare market. A key challenge is the need to build a new hospital and match excellence in our facilities to the excellence of our programs. This need is driven by both seismic as well as programmatic needs and will play an increasingly important role in our planning over the next several years.

Amplifying on the achievements that have been made in Stanford’s electronic medical record system over the past several years, Dr. Kevin Tabb noted that simply having such resources will not by themselves improve quality, efficiency and excellence. Achieving these goals also requires the right people, with the right ideas and vision and the ability to execute them efficiently and effectively. This is not simply a resource issue. It is also an area where critical thinking, evaluation and scientific rigor can make a difference – and which Stanford can also excel at if attention is appropriately focused.

These comments stimulated a broad discussion and I will share some of those important comments with you in future Newsletters.

Panel 3. Transforming Medical Education

This panel was led by Dr. Charles Prober, Senior Associate Dean for Medical Education and Professor of Pediatrics, along with Dr. Clarence Braddock, Associate Dean for Medical Education and Professor of Medicine ; Dr. Henry Lowe, Senior Associate Dean for Information Resources & Technology and Associate Professor of Pediatrics; Dr. Laura Roberts, Professor and Chair of Psychiatry and Behavioral Sciences; Dr. PJ Utz, Professor of Medicine; Chloe Chien, SMS 3 and President of the Stanford Medical Student Association; and Dr. Holbrook Kohrt, Clinical Fellow in Cancer Biology.

Dr. Prober began this panel with a reaffirmation of our mission statement for medical education: *To prepare physicians who will provide outstanding, patient-centered care and to inspire future leaders who will improve world health through scholarship and innovation.* Each word in this mission statement is important and helps define Stanford Medicine and our students. Dr. Prober reminded the attendees that our last major revision of the medical education curriculum was launched in 2003 (see: <http://med.stanford.edu/md/>) and still can be considered unique in its emphasis on scholarship and research. Since the new curriculum was launched, it has been enhanced by a number of important initiatives including the Educators-4-Care (<http://med.stanford.edu/e4c/>), Translating Discoveries (http://med.stanford.edu/md/curriculum/translating_discoveries.html), Criterion Based Evaluation (<http://med.stanford.edu/md/curriculum/CBEI/index.html>), Multi-Mini Interviews (<http://med.stanford.edu/ism/2011/january/interview-0110.html>), and the use of iPads in medical student education (<http://med.stanford.edu/ism/2010/september/ipads-0913.html>).

While each of these programs constitutes another unique feature of the Stanford medical curriculum, there are a number of emerging themes and issues that make a case for change. These include a need to focus learning on patients and communities and on the use of new learning strategies coupled with more sophisticated methods for knowledge retrieval, integration and renewal. In addition, a fundamental underlying issue is that the time for medical education (from high school through fellowship) is too long and too disorganized and requires fundamental reassessment and reform.

Dr. Clarence Braddock put a fine point on the length of training by posing a basic question of whether knowledge acquisition should be time-based (as it largely is now) or competency based (which would permit different rates and paths for knowledge acquisition). The latter would permit coupling of rigorous knowledge and skill outcomes in a more flexible manner. In addition to individual learning, a greater emphasis on team-based skill acquisition and learning will be important. And, as noted in the panel on healthcare reform (see Panel 2) there will be a greater accountability for understanding the intersections of quality, efficiency, cost and value in clinical care delivery.

Among the major changes that are affecting knowledge acquisition are those related to Information Technology – including the electronic medical records, digitally- based means of

acquiring information and the rapidly emerging opportunities for social networking (well beyond and quite different from Facebook or Twitter). With that in mind we need to think of our students as creators of technology tools and not simply users. The novel uses of iPads by current first year medical students that transcend their expected use are reminders that innovation begins with our students. Dr. Lowe also commented on the transformative role that the Li Ka Shing Center for Learning and Knowledge is having – and will continue to have – on medical education in virtually every dimension (from video to simulation and beyond). These emerging technologies offer unique potentialities, opportunities and challenges for our future education programs – and are areas in which Stanford can be a global leader for innovation.

Despite these exciting changes and opportunities, Dr. Laura Roberts reminded us that the journey of medical education and practice is filled with stress and its consequences. She noted that as many as 40% of medical students (in general and not specifically Stanford) indicate depression and as many as 11% have considered suicide. As many as 50% of students meet criteria for “burnout” and 40% indicate problems with personal relationships. These stress metrics increase over time and continue through residency and well beyond. Indeed, it is well known that mental health issues, substance abuse and suicide rates are high in physicians compared to other professions. Dr. Roberts has observed that many students “suffer in silence” since there is a fear of discrimination or negative judgment. Awareness of these conditions needs to be part of the education process, and we need to train students and physicians for competency in dealing with them, including self-care. Developing role models and confidential pathways for intervention would also be important components of addressing this important issue.

Returning to Stanford’s unique mission in educating and training physician-scientists, Dr. PJ Utz called on us to renew and reaffirm a culture of innovation, risk-taking, creativity and flexibility. He recalled some of the experiences that were in place when he was a medical student at Stanford and focused in particular on the ever-increasing length of education and the lack of integration and coordination from high school through residency. He noted, as have others, that we have an opportunity at Stanford to better coordinate medical education across its undergraduate to graduate continuum, redefine the training of the physician-scientist and re-think the criteria for admission to medical school – and even its timing.

We also had an opportunity to hear a reflection on what medical education might look like a decade from now. Medical student Chloe Chien offered the first perspective. She argued for a “dedicated” teaching faculty who would serve as “coaches” to direct self-guided learning. This might be analogous to the Oxford model of learning or to an amplified and enhanced version of the Educators-4-Care program noted above. She also proposed that learning become more experiential, potentially including the acquisition of both basic and clinical knowledge at the point of learning – whether in the hospital or in the clinic. An additional perspective was offered by Dr. Holbrook Kohrt, who completed his MD, residency and fellowship at Stanford and who is now pursuing a PhD degree in the Advanced Residency Training at Stanford Program (see: <http://med.stanford.edu/arts/>). He reflected on the importance of using data to improving clinical care and of the need to better train our students to be managers and leaders who run programs of different size, scope and mission. He pondered whether Stanford is a place to gain medical knowledge or to become a leader. He further underscored the importance of maintaining

humanity in medicine and how technology can be an impediment to connecting doctors to patients (see below).

Panel 4. The Evolving Landscape of Biomedical Research and Innovation

We were pleased to have two outside leaders on this panel; they added a valuable national perspective to our discussion.. The first was Dr. Antonio Scarpa, Director of the Center for Scientific Review at the National Institutes of Health, and the second was Dr. Ann Bonham, the Scientific Director for the Association of American Medical Colleges (AAMC). Both Drs. Scarpa and Bonham had highly productive careers in research and academic medicine prior to joining the NIH and AAMC, respectively. Additional panel members included Dr. Ann Arvin, Vice Provost and Dean for Research and Professor of Pediatrics; Dr. Daria Mochly-Rosen, Senior Associate Dean for Research and Professor of Chemical and Systems Biology; and Dr. Harry Greenberg, Senior Associate Dean for Research and Professor of Medicine.

Dr. Scarpa offered a longitudinal perspective on NIH support for biomedical research from the 1990's through the present. He pointed out in particular that currently 10% of institutions receive approximately 80% of the research funding, although this has not changed substantially over a long number of years. He noted that the while it is less usual for NIH recipients to hold 3 or more grants, a number have two grants. He referred to the finding by Dr. Jeremy Berg [reported in *Nature* 468, 356-357 (2010)] that the productivity of investigators did not appear to increase with funding levels above \$750K, and he noted that some Institutes are assessing the number of grants an investigator should hold. In particular he highlighted the significant increase in the numbers of grants submitted to the NIH during the past decade – reflecting new investigators as well as multiple submissions. For the latter, he proffered that the new NIH scoring system is having an impact by promoting initial quality over resubmission.

Dr. Scarpa also highlighted the fact that the last decade witnessed a focus on supporting new investigators along with more transformative research. At the same time, he reminded us that prior success in NIH funding does not necessarily forecast future success; about 50% of investigators continue to be successfully funded some six years after their first NIH award. While this provides opportunities for new investigators, it raises significant issues for the longevity of a career in research. While Dr. Scarpa could not forecast the levels of future funding, it could be deduced that the current economy and political forces make incremental funding unlikely.

Dr. Bonham further underscored the fact that research funding, as well as support for higher education, will be challenged by the current economy and the projected \$14 trillion debt at both the federal and state levels. She noted that the debt will further impact the healthcare system and will decrease the clinical margins that have been used to cross-subsidize research and academic programs in the past. Dr. Bonham commented on the proposition by Bruce Alberts (*Science* 329, 10 September 2010) that the NIH should not be expected to provide more than 50% of salary support to faculty and that institutions should provide more support. In fact when the AAMC tested this assertion they found that NIH funding accounts for approximately 35% of the salary support for faculty – lower than suggested by Alberts. (This has also been examined at Stanford with a similar finding.) However, it is also clear that there isn't enough money in the system,

regardless of its sources, to support the research enterprise of the past and that changes and reforms are necessary.

One of Dr. Bonham's suggestions was to take advantage of the funds that will be available for outcomes and clinical effectiveness research through the ACA and Medicare. She also emphasized the importance of transparency, particularly in industry relationships, since the perception (and sometimes the reality) of inappropriate interactions with industry has colored the perception of the Congress about the biomedical research community. At the same time, developing new partnerships with industry and other funding sources should also be pursued.

Dr. Bonham underscored a point we have focused on in the past - that size is not the correct measure for success and that greater emphasis needs to be placed on quality of faculty and students. More specifically, the concept that growth is the metric for success needs to be challenged (which is something we have done for some time at Stanford). That concern about growth also needs to be carried over to our workforce – especially since the number of graduate students and post-doctoral fellows has nearly doubled in the past decade without evidence that there are jobs or opportunities for these students and trainees (see below).

Dr. Ann Arvin offered a perspective of the research funding and success data from the point of view of Stanford University – in addition to the School of Medicine. She affirmed that the submission of multiple grants has been a burden on faculty and also (as noted above) that Stanford is already providing more than half of the salary support to its faculty (in the aggregate). Data on the balance of corporate funding versus sponsored federal funding demonstrates that the preponderance of Stanford research support comes from federal compared to corporate sources (\$467 million versus \$67 million) but clearly both are important. The increase in support from the California Institute for Regenerative Medicine (CIRM) in recent years has also been significant. Dr. Arvin also highlighted Stanford's success in interdisciplinary research and the important opportunities for collaboration that exist with different Stanford Schools and Independent Labs, perhaps especially the Linear Coherent Light Source at SLAC.

Dr. Mochly-Rosen picked up the theme of research funding in relation to the School of Medicine and called for a renewed assessment of partnerships with industry. This is a theme we have discussed previously and have considered in relationship to regional partnerships. Clearly this will require further study and evaluation. At the same time, Dr. Mochly-Rosen pointed out that we need to become more efficient and wise about the use of our lab space (which is almost certainly underutilized today despite our funding levels) and that consideration needs to be given to the future size of research groups (e.g., number of benches per investigator, number of students/trainees, administrative efficiencies). One area for focus is the efficiency of our 20 service centers, which carry an annual budget of \$20 million. The questions of consolidation of centers and of operating them on a more efficient schedule (e.g., 24/7) need assessment.

Both Dr. Mochly-Rosen and subsequently Dr. Harry Greenberg emphasized our opportunities in translational and clinical research, including population sciences, clinical effectiveness, outcomes and innovations in healthcare delivery. These are issues gaining focus at NIH, and we need to match them at Stanford by developing the workforce, skills and focus to compete for these funding sources and opportunities.

Panel 5. Thinking About the Future of Graduate Education and Postdoctoral Training

The final panel of the Retreat focused on graduate education and postdoctoral training and is an extension of the important issues about research funding and the size and scope of our research and education missions. This panel included Dr. John Pringle, Senior Associate Dean for Graduate Education and Professor of Genetics; Dr. Tom Wandless, Associate Professor of Chemical and Systems Biology; Dr. Dan Hershlag, Professor of Biochemistry; Dr. Tom Clandinin, Associate Professor of Neurobiology; Dr. John Boothroyd, Associate Vice Provost for Graduate Education and Professor of Microbiology and Immunology; Dr. Jim Ferrell, Professor and Chair of Chemical and Systems Biology; and Dr. Daria Mochly-Rosen, Senior Associate Dean for Research and Professor of Chemical and Systems Biology.

Dr. Pringle began this panel by asking a series of important questions – many of which were forecast by prior panels in the Retreat and in other settings. These included: Are we training too many graduate students/postdocs? What is too many? Are we training them for the right things (i.e., academics versus other career pathways)? Has our academic focus and reward system over-emphasized research productivity over teaching? In addition to our commitment to graduate education, how can we impact postdoctoral training when so much of what happens in this area is influenced by the availability of grant support and decisions made by individual faculty and principal investigators?

In a thoughtful and provocative presentation, Dr. Tom Wandless began to answer these questions by emphasizing his commitment on a deeply personal as well as professional level to graduate students and their education. He described his perception of the differences in function and need of medical versus graduate education and highlighted the apprentice-based model of PhD education (which he also proffered was in need of a critical review in curriculum and focus). At the same time, he argued that the future of graduate education is challenged because of financial problems and disincentives that negatively affect students and programs. Specifically, in his view, the cost for a graduate student is considerably higher than that for a postdoc. Moreover, this cost has increased more than three-fold in the last 5-10 years. The fact that students need to be supported by NIH training grants impacts their ability to move from one lab or school to another and has a negative effect on their perceptions of Stanford. It also affects the morale and perception of faculty, who question whether the reward system values education and teaching.

Dr. Hershlag pursued this theme in his remarks. He began with the statement that graduate education is clearly a core mission of the School of Medicine, and he noted that we all want the best students and also all want them to have the most successful careers possible. But the fact that our graduate education programs are so dependent on training grants means that it is hard to support extremely promising students from outside the USA, which limits the pool of talent on which we can draw. That reality, as well as the cost of graduate education, is having a negative impact on the views of faculty, departments and potential students.

Dr. Tom Clandinin offered his perspective, which was consistent with those of Tom Wandless and Dan Hershlag, that the current financial model for graduate education is having a negative impact on teaching, mentoring and commitment. This has been made worse by the demands on faculty to write more grants and be more productive in their research— an issue that we believe

will, unfortunately, only become more aggravated in a negative funding environment. That said, Dr. Clandinin stressed the importance of focusing renewed efforts on graduate student curriculum, didactic teaching, mentoring and career development – for both academic and other pathways.

Dr. John Boothroyd focused his remarks on two important aspects of postdoctoral training. The first was the annual mentoring meeting. He highly recommended that faculty take the time to meet annually with each of their postdocs, and he further recommended the use of the template for such meetings that was developed in 2005 by the Stanford Postdoc Committee. This template includes such pertinent discussion topics as a review of the postdoc's research and training over the past year, plans for the coming year, career goals, and areas to focus on for the coming year. He has found both the template and the meetings themselves very beneficial to his postdocs and to his role as their mentor. More information about the annual mentoring meeting can be found at http://postdocs.stanford.edu/faculty_mentors/support.html.

The second aspect Dr. Boothroyd discussed was the importance of increasing the diversity of our postdoc population. Currently 2.9% of our postdocs are underrepresented minorities. We need to do better, both because it is the right thing to do and because the national research agenda should reflect the entire range of perspectives that diversity brings. He offered suggestions to increase postdoc diversity, including learning from others, more successful programs, and providing staff time dedicated to this goal.

Dr. Jim Ferrell followed up on the topic of postdoc mentoring and described the relatively new programs the Department of Chemical and Systems Biology has initiated in this area. The department, which has 9 labs and 39 postdocs, recognized that, as difficult as things can be for grad students and med students, there is at least a structure for them that is broader than a single lab. As a result, they instituted the practice of having each faculty member review of the progress of each of his or her postdocs at a faculty meeting once a year. This way all of the faculty know how the postdocs are doing and can offer suggestions and advice. In addition, postdocs must attend weekly departmental research talks, and the department provides food for monthly postdoc meetings.

More than that, the department has instituted a system of postdoc faculty committees. Each postdoc is required to set up a three-person committee consisting of the PI and two others, which can include faculty from other institutions. The committee meets sometime before the end of the postdoc's second year. While there was some resistance to this idea at the outset, now that the committees have started to meet, the response to them has been positive.

Dr. Daria Mochly-Rosen centered her discussion on the fact that many or even most of our postdocs are not going to end up in academic positions. She asked, What are we doing to help postdocs find their way? Our goal, she said, is to make them leaders in whatever they do. She noted that the dichotomy between academic and industry careers may be less clear than we usually think it is. For instance, such skills as managing and leading groups and working in teams may be more common to both career paths than we have thought in the past. It would be good for us to teach our students and postdocs how to do team-based research, which will serve them well no matter where they end up. Dr. Mochly-Rosen also challenged faculty to make sure

that the high value they place on academic careers (because they are in them) does not bias their communications with students and trainees. Finally, she asked, who has the responsibility for the careers of our students and trainees? The individual? The School? Future employers? Considering this question may help us determine the types of programs and supports we should have in place at Stanford.

In addition to panel presentations and discussions, the Retreat attendees had time to gather informally. We had the pleasure of listening to a conversation with Adam Nagourney, the Los Angeles Bureau Chief for the New York Times, with Paul Costello, our Executive Director of Communications and Public Affairs, on a wide-ranging set of topics from violence and gun control, to the politics of healthcare reform, the press and presidents past and current, the economy, the state of California and the future.

I do want to thank everyone one who participated in the 2011 Retreat as a panel member or participant. And I especially want to thank the individuals who helped make the retreat so successful, especially Dave O'Brien, Kristin Goldthorpe, Mira Engel, and Kathy Gillam. There is an enormous amount of planning and logistics that go into making these events successful, and each of these individuals deserves our special thanks for their incredible efforts.

The 2011 Retreat raised many important issues and challenges that are core to our mission and future. Over the next weeks we will further codify the recommendations and action items that were enunciated at the retreat and then prioritize them into the ones that we will work to address over the months ahead. Clearly (and as always) there is much work to be done if we are to “change in a time of change” – and do so successfully and in a manner that helps Stanford to lead change rather than follow its consequences.

Continuing Commitment to Leadership: Faculty Fellows 2011

The Faculty Fellows Graduation Dinner on January 18th offered some additional perspectives on the importance of leadership, mentoring and career development. This was the sixth Faculty Fellows Program established by the pioneering work of Dr. Hannah Valentine, Senior Associate Dean for Diversity & Leadership and Professor in the Department of Medicine (Cardiovascular Medicine). As in past years, an outstanding group of faculty came together over the course of a year and shared experiences from each other and from senior leaders at Stanford University (a number of whom shared their personal “leadership journey” as a vehicle for promoting insight and discussion). Importantly, each Faculty Fellow was assigned to one of four Mentors (the 2010 Mentors included Drs. Heidi Feldman, Professor of Pediatrics; Phil Lavori, Professor of Health Research & Policy; Christy Sandborg, Professor of Pediatrics; and David Stevenson, Professor of Pediatrics) and met in small groups to further refine their knowledge of Stanford and career development. An important part of the program is the facilitation of career development insights and discussions with the Faculty Fellow’s department chair and/or division leader. These career development and counseling meetings have been organized in an outstanding way thanks to the leadership of Julie Moseley, Director of Organizational Effectiveness.

In addition to the increased awareness each Faculty Fellow has developed about the opportunities for them at Stanford and their sense of community with each other and with their mentors, I was really struck by how deeply engaged each department chair or chief was in

fostering and supporting the Faculty Fellow they had nominated for the program. Leadership and mentoring have many components and attributes as well as meanings and perceptions. Among the most important attributes of a successful senior leader in academic medicine is the willingness to put the career development of junior faculty among their highest priorities. This means guiding junior faculty colleagues, helping them to network successfully, and perhaps most importantly, creating opportunities for important leadership opportunities at the division, department or even institutional level. What was perhaps among the most exciting parts of the graduation program was the consistent and deeply felt commitment of senior faculty to their junior colleagues – with clearly articulated expectations and opportunities for their future development and success.

Congratulations to our 2010 Faculty Fellows, including:

- **Amin Al-Ahmad**, Assistant Professor, Department of Medicine (Cardiology) – *nominated and mentored by Dr. Paul Wang*
- **Eliza Chakravarty**, Assistant Professor, Department of Medicine (Rheumatology) – *nominated and mentored by Dr. Gary Fathmann*
- **Alan Cheung**, Assistant Professor, Department of Otolaryngology (Pediatrics) – *nominated and mentored by Dr. Rob Jackler*
- **Robert Dodd**, Assistant Professor, Department of Neurosurgery – *nominated and mentored by Dr. Gary Steinberg*
- **Hayley Gans**, Assistant Professor of Department of Pediatrics (Infectious Diseases) – *nominated and mentored by Dr. Bonnie Maldonado*
- **Neeraja Kambham**, Associate Professor, Department of Pathology – *nominated and mentored by Dr. Steve Galli*
- **Jonathan Kim**, Assistant Professor, Department of Ophthalmology - *nominated and mentored by Dr. Mark Blumenkranz*
- **Maarten Landsberg**, Assistant Professor, Department of Neurology – *nominated and mentored by Dr. Greg Albers*
- **Jason Lee**, Assistant Professor, Department of Surgery (Vascular Surgery) – *nominated and mentored by Dr. Ron Dalman*
- **Christopher Longhurst**, Clinical Assistant Professor, Department of Pediatrics – *nominated and mentored by Mr. Ed Kopetsky*
- **Merritt Maduke**, Assistant Professor, Department of Molecular & Cellular Physiology – *nominated and mentored by Dr. Brian Kobilka*
- **Karen Parker**, Assistant Professor, Department of Psychiatry & Behavioral Sciences – *nominated and mentored by Dr. Allan Reiss*
- **Anna Penn**, Assistant Professor, Department of Pediatrics (Neonatology) – *nominated and mentored by Dr. Bill Benitz*
- **Matthew Strehlow**, Assistant Professor, Department of Surgery (Emergency Medicine) – *nominated and mentored by Dr. Bob Norris*
- **Lu Tian**, Assistant Professor, Department of Health Research & Policy – *nominated and mentored by Dr. Phil Lavori*

Despite the challenges we face, the future seems secure with the continued emergence and development of new faculty leaders. Each brings a unique set of skills and talents in highly

diversified areas of science and medicine. Collectively they will join the Faculty Fellows who have graduated before them – and together we all hope they will impact our institution and all whom it serves.

Converging Perspectives on Valuing Patients

Two perspectives, one from a leading physician-author and faculty member and the second from a new hospital CEO, offered converging and shared perspectives on valuing the patients we serve.

At the first Stanford Hospital & Clinics Medical Staff Quarterly meeting on Tuesday, January 11th, Dr. Abraham Verghese, Professor and Senior Associate Chair in the Department of Medicine, spoke eloquently about the importance of connecting to the patients we care for through the ritual, tradition and intimacy of the physical examination. An initiative which Dr. Verghese and his colleagues have launched to teach the fundamentals and art of the physical exam are embraced in the “Stanford 25” (see: http://medicine.stanford.edu/education/stanford_25.html), which can be observed in video demonstrations (see: <http://stanford25.wordpress.com/>) and which Dr. Verghese and Dr. Ralph Horwitz described in an essay in the December 2009 issue of the British Medical Journal entitled “*In Praise of the Physical Examination*” (see: <http://www.bmj.com/content/339/bmj.b5448.full>). In addition to the value of a careful history and physical examination in establishing a diagnosis and plan of management, often with less expense to the healthcare system, Dr. Verghese also underscored the impact of this “ritual” (as he referred to it) in establishing a strong doctor-patient relationship.

Dr. Verghese gave his remarks to a standing room only audience at the Li Ka Shing Center for Learning and Knowledge, and it was clear that his message resonated with all in attendance. In a number of important ways his simple message rekindles the professionalism and humanism that led most physicians to enter medicine in the first place. The pressures that time and expectations place on physicians to see more and more patients in shorter and shorter amounts of time, along with technologies that often separate rather than connect physicians to their patients, have led to frustration and disillusionment that have become an increasingly felt product of medical encounters – or the lack thereof. Dr. Verghese’s message about using the tools of the physical exam to reconnect the doctor and patient is important and empowering as we seek ways to increase the personalization and patient-centricity of Stanford Medicine.

From a different perspective, it was important to hear Amir Rubin, our new President and CEO of Stanford Hospital & Clinics, address the Council of Clinical Chairs on Friday, January 14th on his commitment to enhancing and improving the patient experience – “one patient at a time.” He spoke clearly and with conviction about the importance of stellar patient experience to the overall success of a medical center, and he provided concrete details about how he and his colleagues helped move the UCLA Medical Center to the top ranks of patient satisfaction. But Mr. Rubin has not only conveyed his commitment to making this a priority at Stanford, at this meeting and elsewhere – he has already begun this process in meetings with physicians, nurses and staff throughout SHC. Thankfully, efforts put into place over the past year led by Drs. Ann Weinacker, Bryan Bohman and Sridhar Seshadri (see:

http://deansnewsletter.stanford.edu/archive/09_13_10.html#4) will complement in important ways this significant initiative from our new CEO.

It is both important and affirming to have a prominent physician and an administrative leader address the future of Stanford Medicine from a converging perspective – patient excellence, one patient at a time. Focused improvements in enhancing the patient experience will be essential to our future. So too will be exceptional innovations and discoveries in science and medicine coupled with excellence in the provision of state-of-the-art care by outstanding physicians and healthcare providers, with the highest level of quality and safety in an optimally valued and cost-based manner. Each of these is an essential feature of the Stanford Medicine we are endeavoring to create together.

Medical and Healthcare Organizations Offer Support for the Affordable Care Act

In a largely partisan fashion, the United States House of Representatives voted on January 19th to repeal the Affordable Care Act. Ever since the passage of the ACA in March 2010 there has been incredible public discord about healthcare reform. Much of this has come from the political side of the equation and relatively little from the medical and professional groups who represent America's doctors, hospital and healthcare providers. While I fully recognize that there was a political agenda by the White House Office of Communications in sending out a list of medical groups and organizations that have offered their support for the Affordable Care Act, it is still notable to review some of the organizations that have taken a stand on this important issue. Accordingly, I am sharing that list with you, unedited and simply as information:

- **American Nurses Association**
"...[W]e believe that a vote for repeal would be a devastating step backward."
- **American Medical Association**
"The AMA does not support initiatives to repeal the Affordable Care Act. Expanding health coverage, insurance market reforms, administrative simplifications and initiatives to promote wellness and prevention are key parts of the new law that reflect AMA priorities."
- **American Academy of Family Physicians**
"A repeal of all provisions in the Patient Protection and Affordable Care Act will return our health care system to its previous trends of unsustainable, increasing costs and ever-growing numbers of under- and uninsured Americans. It will have negative consequences on Americans' access to needed health care for years to come."
- **American College of Physicians**
"ACP believes that Congress should preserve and - as necessary - improve on these and other important reforms created by the Affordable Care Act, not repeal them."
- **Association of American Medical Colleges**
"The nation's medical schools and teaching hospitals stand behind the Affordable Care Act. Ensuring that all Americans have health care coverage is a moral imperative for our nation, and enactment of the Affordable Care Act was an important step toward that goal."
- **National Association of Community Health Centers**
"From the perspective of community health, however, the new law moves our nation to

the goal of more affordable and accessible health care for all people and we stand strongly in support of it."

- **American Osteopathic Association**

"The Affordable Care Act made fundamental and important changes in our health care system that will improve the health of our patients individually and our nation as a whole."

- **Catholic Health Association**

"On behalf of the Catholic Health Association of the United States (CHA), the national leadership organization of more than 2,000 Catholic health care systems, hospitals, long-term care facilities, sponsors, and related organizations, I strongly urge you to maintain support for efforts to improve and strengthen our nation's health care system by opposing the legislation before the House to repeal the Affordable Care Act (ACA)."

- **American Public Health Association**

"Implementation of the Affordable Care Act is critical to addressing a number of the biggest challenges facing our health system including the escalating costs associated with our health care system, uneven quality and more than 100,000 deaths due to medical errors, discriminatory practices by health insurance providers and the shrinking ranks of the nation's primary care providers. The enactment of the Affordable Care Act begins to shift our health system from one that focuses on treating the sick to one that focuses on keeping people healthy and addresses these challenges."

- **Asian and Pacific Islander American Health Forum**

"Almost 60 percent of Asian Americans receive health care coverage through their employers and the last thing we should be doing is weakening the ability of small business owners to provide quality health care to their employees. We must not place the interests of insurance companies ahead of small businesses, our communities, and our families. When insurance companies are free to pursue profit without accountability, people have fewer choices, fewer options, and little recourse. We can't let that happen."

- **Doctors for America**

"As doctors, we see how our broken health care system is failing patients and health care providers. Passing and implementing the Patient Protection and Affordable Care Act is an important first step to fixing a broken system, and we must continue to move forward. Repealing the health care reform law will only move our health care system backward -- and millions of patients simply can't afford that. We urge the new Congress to work with patients and providers to improve the health reform law so we can build a health care system that works for everyone."

- **National Hispanic Medical Association**

"NHMA supports the Affordable Care Act as it is a step forward in caring for the health of the underserved communities and all Americans. Investing in the health of Americans, our most valuable resource, is sound policy and a wise course of action when so many diseases are preventable and treatable. For this reason we ask you to cast a vote against H.R.2."

Call for Nominations for the Augustus A. White III and Family Faculty Professionalism Award

The Stanford Community is invited to submit nominations for the Augustus A. White III and Family Faculty Professionalism Award. This award recognizes outstanding work by a Stanford Medical School faculty member or members whose work helps reduce health disparities and/or enhances the effectiveness of underrepresented minorities through research, education, mentoring or service to the university community. The recipient(s) substantially broaden and deepen the excellence and influence of underrepresented minorities, whether faculty, fellows, residents or students. The recipient (s) may also have diminished differences in health care and health status ascribable to culture, religion, race and other factors.

The first African American graduate of Stanford Medical School in 1961 and the first African American Chair of the Department Orthopaedic Surgery at Harvard Medical School, Augustus A. White, III, M.D., Ph.D, has been a pioneer and role model for underrepresented minorities in academic medicine. Dr. White is also passionate about eliminating health disparities and believes in the importance of underrepresented minority students and faculty in achieving this goal. In collaboration with Dr. White, Stanford School of Medicine has established the Dr. Augustus A. White III and Family Faculty Professionalism Award. This award, administered by the Office of Diversity and Leadership seeks to identify outstanding individuals who make major contributions toward eliminating health disparities, through their research, teaching, mentoring, and by example.

WHO MAY NOMINATE: Any member of the Stanford community (student, faculty or staff) may nominate an individual (or team) whose contributions fit the descriptions above.

HOW TO NOMINATE: Submit a statement that summarizes the activities, contributions and achievements that stimulate the nomination; a biographical sketch of the nominee or leaders of the team; and letter of support (a maximum of 3) that attest to the nominee's demonstrable major contributions and sustained achievements in research, teaching, mentoring or university community service that contribute to strengthening underrepresented minorities in health care and/or eliminating health disparities. Please send your nomination material to the Office of Diversity and Leadership at the School of Medicine (attention: Jennifer Scanlin, Office of Diversity and Leadership, MC 5216 (for US mail send to 291 Campus Drive, LK3C14, Stanford, CA 94305). Email nomination letters may be sent to: jscanlin@stanford.edu. All nomination letters must include the name and position of the nominator and be received by **February 28, 2011**. The confidential nature of the material will be respected.

SELECTION PROCESS: Nominations will be reviewed by the **Dr. Augustus A. White III and Family Award** Committee. The award recipient will be announced by March 30, 2011. The award will be presented at an inauguration celebration on the Stanford Campus on April 15, 2011.

Awards and Honors

Preetha Basaviah, Clinical Associate Professor in the Division of General Medicine / Department of Medicine, received the Northern California SGIM Region Clinician Educator of the Year Award in November, 2010. Dr. Basaviah serves as Course Director of “Practice of

Medicine”, a two-year pre-clerkship clinical skills course, and as one of the Educator for CARE advisors at the medical school. Congratulations, Dr. Basaviah.

Appointments and Promotions

Rajni Agarwal-Hashmi has been promoted to Associate Professor of Pediatrics at the Lucile Salter Packard Children’s Hospital, effective 1/01/11.

Martin S. Angst has been promoted to Professor of Anesthesia at the Stanford University Medical Center, effective 1/01/11.

Ronit Ben-Abraham-Katz has been promoted to Adjunct Clinical Associate Professor of Medicine, effective 11/01/10.

Eran Bendavid has been appointed to Assistant Professor of Medicine, effective 1/01/11.

Suzan Carmichael has been appointed to Associate Professor (Research) of Pediatrics, effective 1/01/11.

Ricardo Dolmetsch has been promoted to Associate Professor of Neurobiology, effective 1/01/11.

Brendan Carvalho has been promoted to Associate Professor of Anesthesia at the Stanford University Medical Center, effective 1/01/11.

Kathleen Eldredge has been promoted to Adjunct Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 11/01/10.

Jesse K. McKenney has been promoted to Associate Professor of Pathology and of Urology at the Stanford University Medical Center, effective 1/01/11.

Neda Pakdaman has been promoted to Adjunct Clinical Assistant Professor of Medicine, effective November 1, 2010

George P. Yang has been promoted to Associate Professor of Surgery at the Veterans Affairs Palo Alto Health Care System, effective 1/01/11.

Dean’s Newsletter February 7, 2011

The Importance of Password Protection and Encryption

The shift in use from personal computers to mobile devices – cell phones, tablets and laptops - over the past several years has been remarkable and promises to accelerate with new innovations in information technology. While the benefits of smaller size and increased mobility are clear to each of us, these devices come with a risk of violating privacy. In particular, physicians and healthcare providers have an increased responsibility to ensure that patient personal identifiers are not lost or stolen – a risk that is surely increased with small, portable mobile devices. The solutions are straightforward and begin with clear care and precision about the kind of information that is contained on one's phone, tablet or laptop. But because information can be received in so many formats, including email, it is possible that inadvertent storage of patient information can occur. That is why mobile devices need protection – beginning with password protection and encryption of laptops. These are easy to put into place and are part of our individual and shared responsibility.

While all this seems straightforward, I am reminding you of it now because I was surprised to learn about one of our faculty who recently lost his cell phone, which contained patient information. As soon as he realized that the device had been lost, this faculty member did notify the privacy officer and also discontinued the cell phone service. While these were the right things to do, there was one major error. The cell phone had not been password protected, making the privacy information immediately accessible to anyone who found (or stole) the device. This underscores that password protection is something each of us should do – for every device we carry. Nothing is totally protective (as readers of the Stieg Larsson trilogy well know) but it is simple to do and should be the first step of device security for each of us.

I asked **Dr. Todd Ferris, Privacy Officer**, to share some advice for us on mobile devices. Here is what he provided for your information:

"Password, PIN codes, and security questions may feel like time-wasting nuisances, but that couldn't be further from the truth. These vital nuggets of secret information, when paired with encryption technology, keep patient and other restricted information safe. Without these protections in place, a lost or stolen device leads to an immense amount of time spent investigating, reviewing files, and notifying affected individuals - much more time than spent entering passwords.

Encryption and passwords go hand in hand. One without the other provides no protection. And remember, giving out your password is just like removing it. Never share your password with anyone, even if they appear to work for the technology group. The various Stanford technology groups will never ask you to reveal your passwords.

These same rules apply to smartphones (Blackberry, iPhone, Android, etc) and tablets (iPad). Only devices that are encrypted and password-protected can be used to access or store patient or other restricted information (See http://securecomputing.stanford.edu/dataclass_chart.html for more information about what constitutes "restricted" information.) The Stanford email system frequently contains restricted information and consequently, should only be accessed on encrypted and password-protected devices. At this time, only Blackberry, recent iPhones (3gs & 4) and iPad have encryption. Smartphones and tablets without encryption should have passwords in place and

must only access campus email and calendar via mobile webmail (<https://webmail.stanford.edu>), which doesn't download information onto the device.

Please remember, failing to properly protect your devices and passwords places you, the institution, patients, and research subjects at risk.

The Information Security Services group in the school has a website (<http://irtsecurity.stanford.edu/>) with more information about securing your devices."

In addition, and as I have communicated previously (see http://deansnewsletter.stanford.edu/archive/07_27_09.html#4 and http://deansnewsletter.stanford.edu/archive/11_09_09.html#7), the State of California is particularly rigorous and firm on personal privacy violations. Laws passed in 2009 (Senate Bill 541 and Assembly Bill 211) make it a responsibility of institutions to report breaches of information security and to notify each person whose information may have been stolen or lost. While this danger is certainly known to each of us, the fact that violations of privacy security have been occurring (and even increasing) makes attention to password protection, encryption and privacy security an imperative. Healthcare workers are subject to major fines and disciplinary action: some have even lost their jobs.

So this is a good time to pause and check your own devices. If you have not installed password protection, please do so now. If you have a laptop it should be encrypted (a process that will be available to other devices in the near future). A violation of privacy information creates major personal and institutional risks. Nearly all are preventable - and that prevention begins with each of us.

The Economic Value of Research

The funding for basic science research included in the American Recovery and Reinvestment Act of 2009 (ARRA) provided the opportunity not only to create knowledge and, potentially, future cures of human disease, but also to create jobs and stimulate the economy. Both are important for clearly different reasons. The economic benefit of ARRA funding has been previously presented in this Newsletter (see http://deansnewsletter.stanford.edu/archive/12_13_10.html#2 and <http://med.stanford.edu/stimulus/>).

Following a similar theme, the California Institute for Regenerative Medicine (CIRM) recently issued a report of the economic impact of the stem cell funding that began in 2004 with the passage of Prop 71 by the citizens of California, which authorized \$3 billion of funding to support research and infrastructure. This is the most significant investment in stem cell research in the world. In the report, issued on January 27, 2011 (see http://www.cirm.ca.gov/pressrelease_2011-01-27), Dr. Jose Alberro from the Berkeley Research Group, who was commissioned by CIRM, reported that from April 2006 (when the litigation blocking stem cell funding was overruled in Court) through July 2010, CIRM has awarded over 364 grants to more than 50 institutions in California. The grant portfolio totaled \$1.1 billion (and it is expected that these awards will be fully expended by the end of 2014). Included were 12 major facilities awards enabling California to develop new research laboratories for stem cell

research. Importantly, these awards were matched by \$844 million from donors and institutions, creating an important leveraging effect of the taxpayer investment in research. According to this report, a number of important one-time and on-going economic impacts are being achieved. These include the creation of 24,654 new jobs in California between 2006-2014 as well as the payment of \$157.6 million in tax revenues to the State of California and \$44.4 million to local governments.

The impact of CIRM funding on Stanford has also been notable. Since 2006, Stanford faculty and Stanford University have received \$186.5 million. Just this past week six faculty received a \$10.6 million in the latest round of CIRM grant funding. Notably, Stanford was successful in competing for a major facilities grant worth \$44.6 million, which was critically important in the construction of the Lorry Lokey Stem Cell Research Building that opened in 2010.

More broadly, academic medical centers (whose missions include education, patient care and community service in addition to research) have a major impact on our local and national economy. A 2009 report from the Association of American Medical Colleges (see also: http://deansnewsletter.stanford.edu/archive/11_23_09.html#3 and <http://med.stanford.edu/ism/2009/november/academic.html>) estimated that the overall economic impact of academic medical centers totaled \$512 billion – or 20% of the health-care sector.

The CIRM report on research, coupled with the stimulus from ARRA funding and the overall impact of academic medical centers, offers clear evidence of the benefits of investments in research. This is one of the reasons why President Obama highlighted the importance of investments in innovation to our national security, preeminence and prosperity. And while the economic payoffs are critically important, the societal and personal benefits to discoveries that improve our world and wellbeing are surely the most valuable dividends for continuing to invest in research, innovation and discovery.

The NIH and Graduate Education

Much has been written, including in this Newsletter, on the economic forecasts for the NIH in the post ARRA pre-deficit reduction era (see: http://deansnewsletter.stanford.edu/archive/12_13_10.html#2, http://deansnewsletter.stanford.edu/archive/01_10_11.html#1 and http://deansnewsletter.stanford.edu/archive/01_24_11.html#1). This past week the National Institute of General Medical Sciences (NIGMS) turned its attention to graduate education and circulated for comment its Strategic Plan for Biomedical and Behavioral Research Training entitled *“Investing in the Future”* (see: http://publications.nigms.nih.gov/training/NIGMS_Research_Training_Strategic_Plan201101.pdf). The NIGMS recognizes that it is just one of the sources of training support from the NIH but acknowledges that their plan is designed to examine whether the training programs it supports are aligned to NIGMS commitment to build an “excellent, diverse work force.” Interestingly, the report mirrors the discussions we have been having at Stanford about the future of graduate education – at our think tank last fall (see: http://deansnewsletter.stanford.edu/archive/10_11_10.html#3) and at our Leadership Retreat just a couple of weeks ago (see: http://deansnewsletter.stanford.edu/archive/01_24_11.html#1). One of the major themes of the report is the importance of educating and training students for various

career pathways, not just academia, and of elevating the status of diverse pathways in the public and private sector. There is also the recognition that the length of time to independence is too long, taking into account both graduate education and postdoctoral training. Further, there is the continuing challenge that the US biomedical workforce does not mirror US diversity.

The report attempts to define what success means for graduates of biomedical education and training programs. It specifies that a well-trained scientist:

- is conversant in a common set of biological/biomedical principles
- can identify an important problem and knows how to address it
- has a range of career options and the ability to choose among them, and
- is competitive in his or her chosen field, interest area, specialty or discipline

With those goals in mind the strategic plan articulates four themes:

- Research training is a responsibility shared by the NIH, academic institutions, faculty and trainees
- Research training focused on student development, not simply selection of talent
- Breadth and flexibility enable research training to keep pace with opportunities and demands of contemporary science and provide the foundation for a variety of scientific career paths.
- Diversity is an indispensable component of research training excellence, and it must be advanced across the entire research enterprise

Based on these broad statements, the plan advances a number of action steps, some of which could change the funding landscape, potentially including the evaluation of RO1 funding. Some of the controversial issues are further enunciated in a News and Analysis report in *Science* (see: <http://www.sciencemag.org/content/331/6017/525.full>), and both this article and the report are worth reviewing during the period of public comment.

While these are incredibly serious matters and are consistent with the planning activities independently underway at Stanford (activities that will be further developed as follow-up from the January Retreat), I want to end on an uncharacteristical (for me) note by sharing a funny but poignant (and now viral) YouTube video parody on the impact of a bad project (see: <http://www.youtube.com/watch?v=Fl4L4M8m4d0>). No further comments are necessary or appropriate!

Stanford Hospital & Clinics Celebrates Its Corporate Partners

On Monday, January 31st Stanford Hospital & Clinics announced that six leading Silicon technology companies (Apple, eBay, HP, Intel, Intuit and Oracle) have become founding members of the Stanford Hospital Corporate Partners Program. Together these six companies will contribute as much as \$150 million over the next 10 years to help build the new Stanford Hospital. Equally importantly, these innovative companies will work collaboratively with Stanford Medicine to develop novel approaches to patient access, navigation, education, information, and more. The inauguration of this outstanding program is due largely to the incredible work and dedication of SHC Board of Directors member Ron Johnson. Over the past several years he tenaciously developed the program and worked directly with each of the six companies (and others) to engage their participation.

The new Stanford Hospital Corporate Partners Program was celebrated at a lovely event at Cantor Art Museum that was hosted by Ron Johnson, Mariann Byerwalter (SHC Board Chair) and Amir Rubin (SHC President & CEO). President John Hennessy set the stage for the Corporate Partners Program, noting that “ *There is no better time to invest in the future of health care than now, and no better place than Stanford, in the heart of Silicon Valley. By joining with us at this moment, these companies have demonstrated great leadership that reflects their ongoing commitment to improve the quality of life on a global scale.* ”

Celebration of the Opening of the Byers Eye Institute at Watson Court

On January 26th the Eye Institute at Stanford hosted a Symposium and Tours to celebrate its inaugural home at the beautiful Watson Court facility in Palo Alto (see: <http://stanfordhospital.org/eyeinstitute/>). The Institute was constructed by Stanford Hospital & Clinics with the support of a number of private donors and benefactors, most notably Brook and Shawn Byers. This facility, which now houses the clinical offices and ambulatory programs for the Department of Ophthalmology, has been named the Byers Eye Institute at Stanford. The plans and successful completion of this new facility are the fruit of the dedication and vision of Dr. Mark Blumenkranz, Professor and Chair of the Ophthalmology. For more than a decade Dr. Blumenkranz and his colleagues have worked diligently to develop a state of the art care and treatment facility. Thanks to his commitment and endurance – and the support of patients, donors and SHC – this new facility has opened its doors for all outpatient care, including urgent care. In the very near future, the facility will also house surgical facilities, making this the most advanced eye care facility in the Bay Area and beyond.

I want to extend special accolades and appreciation to Shawn and Brook Byers for their wonderful contribution and, of course, to Dr. Mark Blumenkranz and his colleagues. Their dedication to improving the care of patients with eye disease has been unwavering and is now evidenced in this wonderful new Byers Eye Institute at Stanford.

Continuing the Discussion on Smoking Cessation

In 2007 Stanford Medical School became “smoke free” throughout its campus (http://deansnewsletter.stanford.edu/archive/04_09_07.html#1). We were joined by Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital in 2008 (http://deansnewsletter.stanford.edu/archive/07_28_08.html#4), thus making the entire medical center smoke-free. This is an important statement on health and disease prevention to our community and the patients we serve. In tandem, Dr. Rob Jackler, Sewall Professor and Chair of the Department of Otolaryngology: Head and Neck Surgery, has played an important role in demonstrating and highlighting the role of physicians in the history of smoking and, of course, the role they now play in helping to prevent smoking and the related diseases it causes. While progress has been made, much work remains.

With that in mind, Dr. Jackler asked me to let you know that a conference on smoking cessation will take place on April 1st in the Li Ka Shing Center for Learning and Knowledge from 8 am – 4:30 pm. The program features world-renowned speakers including: Dr. C. Everett Koop, 13th

U.S. Surgeon General (videotaped for this conference), and Dr. Michael C. Fiore, Chair of the Joint Commission's Tobacco & Alcohol Advisory Panel and author of the USPHS Treating Tobacco Use and Dependence – Clinical Practice Guideline.

Developing Guidelines for Innovative Care

At the Executive Committee on February 4th, Dr. Frank Longo, George and Lucy Becker Professor and Chair of the Department of Neurology, and Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs and the Berthold and Belle N. Guggenhime Professor in Medicine, presented the report of the task force they co-chaired to develop Innovative Care Guidelines for the Stanford University Medical Center (SUMC). As stated in the preamble to their report: *"The Purpose of these Guidelines is to assist members of the medical staffs of the SUMC hospitals and clinical academic units at Stanford University School of Medicine in appropriately identifying and making the distinction between innovative care and research. The Guidelines provide the definitions that support this distinction and a process for guidance and oversight of innovative care...These Guidelines are designed to support, not impede, physicians in their consideration of care and protection for their patients."*

This first review of the new Guidelines for Innovative Care stimulated a thoughtful discussion that will be continued by the SHC and LPCH Medical Staff Executive Committees as well as at departmental meetings with faculty. We are interested in comments and reflections.

Over the next months I plan to share the Guidelines with you more fully but at this juncture, I wanted to let you know they are being developed, formulated and circulated for discussion and further input. We envision this as a starting point with subsequent changes based on experience and thoughtful reflection and data.

The Half-Century Club and the Alumni Association

On February 1st I had the pleasure of meeting with members of the Half-Century Club – medical school alumni who graduated from the Stanford School of Medicine 50 or more years ago. The nearly 100 attendees included one graduate from the Class of 1938 along with colleagues who graduated in the 1940's and 1950's – all when the School of Medicine was housed in San Francisco. It was wonderful to visit with physicians who shaped medicine during the latter half of the 20th century and who laid the foundations for Stanford Medicine as we know it today. I want to thank Patrick Delahunt, Sandra Handy and Kirstin Krimsley from our Office of Medical Development for making all of the many arrangements that allowed our senior faculty to reunite with each other and to reconnect with Stanford. I also want to thank Dr. Linda Clever, Associate Dean for Alumni Affairs, and the Stanford University Medical Association for their important efforts to bridge and connect our generations of graduates.

Update on Staff Employee Survey

I want to thank all of the SoM staff who participated last fall in the Stanford Staff Employee Survey. The survey is an effort by the School and many other Stanford schools and units to get feedback from employees about their experiences in the work environment. This vital information will help us make Stanford and the School of Medicine an even better place to work.

The confidential, online survey went to 2,794 employees at the School of Medicine (those who were on the payroll as regular staff as of June 1, 2010). I'm pleased to report that 69% of them responded – an excellent response for a first survey of this kind. In the university at large, some 4,000 employees, including the SoM completed the survey.

I applaud the very positive results that are emerging from the survey, which make clear that, in general, School of Medicine employees are highly committed; genuinely care about those we serve (such as students, faculty, patients, parents, etc.); feel their individual work is meaningful; and are proud to work here.

At the same time, the survey has disclosed a number of areas where we can improve. Some employees expressed concern about the feedback and coaching they receive, and some indicated that they felt they were not included in the process – or fully informed – when organizational changes are made. Some indicated they did not feel their opinions were always valued. Clearly, these are areas in which we need to focus.

To fully understand the survey results, each department or unit will meet over the next month to discuss its specific survey findings with staff and to create an action plan to sustain or improve the work environment. Typically a department will concentrate on the 2-3 highest priority areas, to start, and will work only on the issues they can influence at the local level. I urge you to take an active role in these meetings and provide any additional feedback and ideas you may have. It is essential that we hear from staff so that we can make changes for the better.

I am aware that some employees also expressed concerns about issues that are set by the central university, such as pay, the job classification system, benefits, and so forth. The School will make sure that the university is aware that these issues are of concern, and we will advocate for changes that may bring improvements in these areas.

The survey creates a base line that we can use to measure our progress in a number of areas. Where we did well, we want to sustain those high ratings. Where we can improve, we want to take those incremental actions that will let each of you know that your time in completing the employee survey and participating in the action planning process is well spent. Again, my congratulations and thanks for the terrific work you do.

Dr. Augustus A. White III and Family Professionalism Award

The Stanford Community is invited to submit nominations for the Dr. Augustus A. White III and Family Professionalism Award.

The first African American graduate of Stanford Medical School in 1961, and the first African American Chair of the Department Orthopaedic Surgery at Harvard Medical School, Augustus A. White, III, M.D., Ph.D, has been a pioneer and role model for underrepresented minorities in academic medicine. In collaboration with Dr. White, Stanford School of Medicine has established the Dr. Augustus A. White III and Family Faculty Professionalism Award. This award, administered by the Office of Diversity and Leadership seeks to identify outstanding

individuals who make major contributions toward eliminating health disparities, through their research, teaching, mentoring, and by example.

WHO MAY NOMINATE: Any member of the Stanford community (student, faculty or staff) may nominate an individual (or team) whose contributions fit the descriptions above.

HOW TO NOMINATE: Submit a statement that summarizes the activities, contributions and achievements that stimulate the nomination; a biographical sketch of the nominee or leaders of the team; and letter of support (a maximum of 3) that attest to the nominee's demonstrable major contributions and sustained achievements in research, teaching, mentoring or university community service that contribute to strengthening underrepresented minorities in health care and/or eliminating health disparities. Please send your nomination material to the Office of Diversity and Leadership at the School of Medicine (attention: Jennifer Scanlin, Office of Diversity and Leadership, MC 5216 (for US mail send to 291 Campus Drive, LK3C14, Stanford, CA 94305). Email nomination letters may be sent to: jscanlin@stanford.edu. All nomination letters must include the name and position of the nominator and be received by **February 28, 2011**. The confidential nature of the material will be respected.

SELECTION PROCESS: Nominations will be reviewed by the **Dr. Augustus A. White III and Family Award** Committee. The award recipient will be announced by March 30, 2011. The award will be presented at an inauguration celebration on the Stanford Campus on April 15, 2011.

Upcoming Events

- ***The Second Medical Staff Conference*** will be held on Tuesday, April 5th at 5 pm in the Li Ka Shing Center for Learning and Knowledge. This event will feature a panel discussion on the Implications of Healthcare Reform for Stanford. The featured panel speakers will include:
 - ***Robert K. Jackler, MD***, Sewall Professor and Chair, Department of Otolaryngology-Head & Neck Surgery; Professor, Departments of Neurosurgery and Surgery; and Associate Dean, Postgraduate Medical Education.
 - ***Arnold Milstein, MD, MPH***, Professor of Medicine and Director of the Clinical Excellence Research Center.
 - ***Alan M Garber, MD***, Henry J. Kaiser Jr. Professor of Medicine and, by courtesy, of Economics; Professor of Health Research and Policy & Economics in the Graduate School of Business; and Senior Fellow at the Freeman Spogli Institute for International Studies at Stanford.

All SHC and LPCH Medical Staff members and house officers are invited to attend. For additional questions please contact Jean Hengst (jhengst@stanford.edu) at the Stanford Center for CME.

- ***Rewiring the Brain: Present Realities and Future Hopes***: This symposium featuring a multidisciplinary faculty will be held on February 28th in the Clark Center from 7:30am – 4:30pm

Celebrating New Endowed Professorships

We recently had the opportunity to celebrate two professorships, each honoring exceptional faculty and the families who made them possible.

- **Dr. Tom Robinson** was officially named as the first holder of the Irving Schulman, MD, Professorship in Child Health in a celebration on January 25, 2011. Thanks to the support from the Lucile Packard Foundation for Child Health and the Lucile Packard Children's Hospital (LPCCH) this professorship was created to honor the exceptional contributions of Dr. Schulman to American pediatrics, LPCCH and Stanford. Dr. Schulman, who died in 2009, was a renowned pediatrician with special expertise in pediatric hematology. He became the chair of the Department of Pediatrics at Stanford in 1972, a position he held until 1991. Dr. Schulman was a major contributor to the development of LPCCH and to the career development of generations of pediatric trainees and faculty.

Dr. Robinson is a fitting first incumbent of the Schulman Professorship. He has made major contributions to the study and treatment of obesity in children and has developed a unique interdisciplinary research and care program that spans the full spectrum of Stanford University. He champions a "solution oriented" approach that is designed to address questions relevant to clinical care from an individual to a societal level. Dr. Robinson has been honored with numerous awards and recognitions for his research, and it fitting that he is now honored by being named the Schulman Professor of Child Health.

- **Dr. Michael Levitt** was installed as the Robert W. and Vivian K. Cahill Professor on February 3, 2011. This wonderful event brought together three Cahill Professors (Paul Berg, the first incumbent; Stan Falkow, the second; and now Michael Levitt, as the third and newest incumbent) with three generations of the Cahill family. We had the opportunity to honor a distinguished family with close and enduring ties to Stanford along with three remarkable faculty members who have transformed science and medicine in extraordinary ways. Like his fellow exceptional Cahill Professors, Dr Levitt has created new insights of exceptional importance. His pioneering work in computational biology has elucidated the prediction of protein structure, folding and function, including the development of methods to humanize antibodies – which has had a major impact on modern medicine. He has also used powerful computational and computer analyses to study nucleic acids and their relationship to protein structure and function. His contributions have led to numerous prizes and honors including election to the National Academy of Sciences and as a Fellow of the Royal Society.

Please join me in congratulating Drs. Robinson and Levitt.

Awards and Honors

- **Dr. David Gaba**, Associate Dean for Immersive and Simulation-Based Learning and Professor in the Department of Anesthesia, has been named the first-ever recipient of the Under Secretary for Health's Award for Excellence in Clinical Simulation Training.

Education and Research. VA Under Secretary for Health, Dr. Robert A. Petzel, presented the award during the International Meeting of Simulation in Healthcare in New Orleans Jan. 24. *"This award honors an individual who has made a national impact through the direct provision of clinical simulation training, education and research in VA," said Dr. Petzel. "Dr. Gaba's influence on the skills of clinical staff throughout VHA has benefited the millions of Veterans cared for in our health care system."*

Please join me in congratulating Dr. Gaba.

- **Dr. Barbara Sourkes**, Associate Professor of Pediatrics, has received the 2011 Outstanding Clinical Care award by the American Psychosocial Oncology Society and will receive the award at their annual conference in Anaheim on February 18. Congratulations to Dr. Sourkes.
- **Dr. Preetha Basaviah**, Clinical Associate Professor in the Division of General Medicine / Department of Medicine, received the Northern California SGIM Region Clinician Educator of the Year Award in November, 2010. Dr. Basaviah serves as Course Director of "Practice of Medicine", a two-year pre-clerkship clinical skills course, and is one of the Educators for CARE advisors at the medical school.

Appointments and Promotions

Arthur J. Abrams has been reappointed to Clinical Associate Professor of Dermatology, effective 11/1/2010.

Anne Brunet has been promoted to Associate Professor of Genetics, effective 2/1/2011.

Rosalind S. Chuang has been appointed to Clinical Assistant Professor of Neurology, effective 4/1/2011.

James E. Egbert has been reappointed to Clinical Associate Professor (Affiliated) of Ophthalmology, effective 9/1/2010.

David Gregg has been appointed to Clinical Associate Professor of Surgery, effective 1/1/2011.

Kevin Malott has been promoted to Clinical Associate Professor of Anesthesia, effective 2/1/2011.

Kalpana Nathan has been appointed to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 3/1/2011.

Matthew Porteus has been appointed to Associate Professor of Pediatrics, effective 2/1/2011.

Amy S. Sturt has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 10/1/2010.

Gloria Wang has been reappointed to Clinical Assistant Professor (Affiliated) of Ophthalmology, effective 2/1/2011.

Katherine Williams has been reappointed to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 12/1/2010.

Dean's Newsletter

February 22, 2011

Academic Medicine: One Country at a Time

On February 17th and 18th I had the opportunity to attend and participate in the Association of Academic Health Centers (AAHC) International meeting in Sydney, Australia. Over the past several years AAHC has brought together leaders from medical centers around the world to share knowledge and experience about the state of global academic medicine. This was the 2nd Asia-Pacific Meeting of the AAHC International. As the past Chair of the AAHC Board of Directors I have had the opportunity to participate in a number of these annual meetings and have been impressed by both the similarities and the differences in goals and objectives in different parts of the world.

Because the alignment of schools of medicine with other professional schools and teaching hospitals has existed in the US for than a century, it is easy to imagine that similar organizational structures exist worldwide. This is not the case, but it is notable that in the past decade a number of countries have worked toward creating academic health centers of various configurations. Of course, one must be quick to point out that in the US academic health centers are highly variegated in organization and governance as well as in goals and missions and size, scope and complexity. The adage that “if you have seen one academic medical center, you have seen one academic medical center” holds true in the US, but it also has an international correlation in that each country’s efforts appear different from those of others. That said, there are some striking similarities as well.

For instance, it seems clear that nearly every leader of a medical school aspires to an organizational structure that brings alignment to the tripartite missions of education, research, and patient care. The AAHC International meeting in Sydney focused primarily on Asia and the Pacific Rim and included discussions from leaders of developed and still developing nations. In some cases (e.g., China, Thailand) the size of hospitals frequently exceeds 2000 beds; in these settings the patient throughput is enormous, and it dominates the time and focus of the physicians. Similarly, the number of students is measured in the hundreds to thousands – clearly different from the experience in the US.

In other countries (Australia, New Zealand, Singapore), the size of the patient care facilities is measured in the hundreds of beds, but the services provided are influenced enormously by the geography (e.g., rural versus more urban settings) and of course the economy. Regardless, there is a common aspiration to demonstrate the value of the academic center – even when it barely exists. For example, in Australia the discussion about whether an academic center has true value

to the community it serves – and even whether “academic” is an appropriate descriptor – is noteworthy. In Singapore, a decade of effort has now led to three and soon-to-be four academic centers that bring together medical school/university faculty with hospitals and government.

A common recognition among the AAHC meeting participants was the need to change the hospital-centric focus that has dominated the past decades to a more distributed delivery system. And, not surprisingly, there seems to be a common thread in the need to train and distribute more primary care physicians, to develop more teamwork between doctors, nurses and other health professionals and to focus more on prevention and population management than higher end care. That these themes were pervasive in virtually every nation represented at this meeting underscored a commonality in the state of healthcare that was surprising to me. Equally surprising were the difficulty of moving to effective “healthcare reform” in most nations and the similarity of the deeply divided opinions in other countries to the ones that have dominated the US with one exception. In most countries healthcare is seen as a human right – which is still a source of debate in US.

Whereas academic medical centers in the US are often self-governed, the roles of ministries of health and education have created more of a dividing line in many countries, separating the missions of education and patient care – a theme I noted when AAHC compared the state of academic health centers in Europe and South America to that in the US (see http://deansnewsletter.stanford.edu/archive/03_02_09.html#3, http://deansnewsletter.stanford.edu/archive/05_24_10.html#7). At the same time, the seemingly global desire to better align research, education and patient care, to speak more effectively to improved models of healthcare delivery and to champion social justice as valued themes in academic medicine offer encouragement and promise for the future – even with the many challenges that need to be addressed during the years ahead.

The Coming Impact of the Elderly on Academic Health Centers

The topic I was asked to address at the AAHC International meeting in Sydney was the “The Academic Health Center and Problems of the Aging Population.” I thought this assignment was somewhat ironic since some decades ago my personal decision about caring for the elderly was to follow a career path in pediatrics! Now that I am officially joining the ranks of the “elderly” (at least in a relative sense) and am increasingly cognizant of the healthcare challenges that lie ahead on both a personal and a societal level, this topic seems increasingly propitious. Further, the family-based care models that are so integral to the care of children with complex chronic disorders offer some insights and relevance to the management of the elderly. Needless to say, these issues will be of increasing importance to the future of Stanford Medicine as the demography of our population shifts and healthcare resources become challenged and constrained.

If 2010 marked the 100th anniversary of the Flexner Report, which defined the structure, organization and even missions of academic medical centers in the US, 2011 marks the beginning of the first wave of the transition of the “baby boomer generation” to senior status. Over the next two decades the number of US citizens over the age of 65 years will increase from the mid-30 million to over 70 million individuals. Based on this bulge, senior citizens will

comprise 20% of the population of the US (compared to about 12% today). These major shifts will have significant consequences for individuals, families, and communities – and of course for our healthcare system and the economy.

Each generation brings unique characteristics and some challenges that are different from prior ones. Relevant to family centered care, the baby boomers tend to have fewer children, higher divorce rates and greater geographic dispersion compared to prior generations. This reduces the numbers and accessibility of “informal” care providers traditionally comprised of family and friends. The healthcare “expectations” of the baby boomer generation are higher than for past seniors, and it is expected that they will be more likely to seek and use healthcare services. This is already an issue since seniors already disproportionately use healthcare services. For example, seniors account for 26% of doctor office visits and 35% of visits to nurse practitioners, even though they currently constitute about 12% of the population. Seniors also account for 35% of hospital stays, 38% of visits to emergency departments and 34% of drug prescriptions (mostly due to antihypertensives, antiplidemics, hormones, CNS and GI drugs).

With ever-increasing longevity, it is expected that the demand and expectations for medical services will increase and will be further fueled by changes in technology and innovations – as well as changing patterns of risk factors that predispose to chronic disorders. For example, the decline of tobacco use in the baby boomer generation will mean less lung cancer, cardiovascular and other smoking related disorders. While this is good news, its positive impact is challenged by the rapid increases in obesity we have seen in recent years and the impact of obesity on chronic health disorders (diabetes, cardiovascular disease, bone and joint abnormalities). With aging the impact of neuropsychiatric disorders, particularly depression, looms larger. Further, the prevalence of dementias and their associated effects on the integrity of the family and healthcare system will also increase.

The current economic downturn in the US, as well as globally, will also influence the care of the coming elderly population. Many emerging seniors have witnessed major erosions in retirement savings and have lost jobs and economic security – especially since life spans are projected to increase beyond the availability of personal savings for a number of seniors. Loss of employment and state pensions aggravate this further and are the consequence of local-regional as well as national events and decisions.

The healthcare of individuals 65 years and older cannot be separated from the major issues and challenges that have surfaced during the debate on healthcare reform that led up to the Affordable Care Act (ACA) of March 2010. Despite the debate, often uninformed by facts, that the ACA was a “government takeover of the American healthcare system,” the reality is that federal and state entitlement programs (particularly Medicare and Medicaid) provide over half of US healthcare expenditures and are the major source of healthcare insurance for individuals over 65 years of age. Now in its 46th year, Medicare is the major provider of hospital, ambulatory and even nursing care programs for the elderly. In the aggregate Medicare provides more financial support per unit of care for inpatient and technical services than for ambulatory ones. At the same time, most teaching hospitals and physicians have concluded that reimbursements from Medicare are below the cost of services; this has led to a shift of costs and reimbursements to private payers.

With the looming US deficit (now over \$14 trillion) and the increasing call for deficit control, reductions in federal and state programs seem inevitable. Even though the currently proposed “\$100 billion budget reductions” are being debated in the US Congress, the reality is that these cuts would have little impact on the major entitlement programs (Medicare, Medicaid, Social Security), and it is implausible that these programs can remain untouched if true economic balance is to be restored. But the politics surrounding this debate are incredible and rancorous and best left out of this Newsletter. That said, one of the looming changes in Medicare is the coverage of the Graduate Medical Education (GME) payments to teaching hospitals, which have been embedded in Medicare since it was passed in 1965. Whether the funds for GME are decreased or redirected, the consequences for teaching hospitals and academic medical centers will be significant. Such changes are likely to unfold in one manner or another and will be driven, in part, by the reality that unless changes are made, the Medicare Trust Fund will be bankrupt in 2017-2019.

Clearly these and related challenges will affect the tripartite mission of academic health centers in education/training, research and patient care – in general and specifically in the care of the elderly. Despite decades of knowing that the aging of the baby boomer generation and consequent rise in the population of elderly was coming, we in the US seem ill-prepared to address the challenges – in the education and workforce we have available, in our knowledge and research related to aging and the elderly and in our patient care services. Few medical schools and academic centers in the US have emphasized training in geriatric medicine or psychiatry – and yet the workforce needs will be significant. Currently there are just over 7000 geriatricians and approximately 1600 geriatric psychiatrists in the US. It is projected that we will need over 36,000 geriatric physician providers by 2030, but there is no real plan about how to achieve those numbers.

Even the physicians currently being trained in general and internal medicine have limited exposure to the care of the elderly, since most of their education takes place in the hospital setting and not in the ambulatory, home or nursing care facility. This problem is likely to worsen with the reduction of resident work hours that begins in 2012. But it will likely also be affected by the changes in the funding and expectations surrounding Medicare-supported GME. The needs for physicians (including psychiatrists) are just a small part of the workforce challenge, with a nearly 35% increase in the availability of nurses, social workers, psychologists, pharmacists, etc also being required. The importance of team based care, coordination and training is also incredibly important.

While some major insights on the biology of aging have emerged, and while the National Institute on Aging was founded as part of the National Institutes of Health (NIH) in 1974, basic and clinical research into aging and its related disorders is filled with major gaps in knowledge. This situation is further compromised by a paucity of physician-scientists and investigators who are focused on aging and geriatric research. And while this is an opportunity, the projected declines in funding, especially from the NIH, make these limitations loom even larger.

Of course the major challenges will be in the medical, surgical, emotional and behavioral care of the elderly – including their families, friends and communities. As noted, geriatric services at

many hospitals are lacking and the relatively lower professional payments for geriatricians have been a disincentive to enter this field. Consequently most elders are cared for by teams of specialists in a manner that is more fractured, uncoordinated and expensive than it should be. Since most elders have one or more chronic illnesses, coordination and management is even more important. New models of care are essential, one being the Ambulatory ICU (A-ICU) championed by Dr. Arnie Milstein, Professor of Medicine and Director of the new Clinical Research Excellence Center at Stanford. A readable description of how this model works in practice is well described by Dr. Atul Gawande article entitled “The Hot Spotters” in the January 24th issue of the *New Yorker* (http://www.newyorker.com/reporting/2011/01/24/110124fa_fact_gawande). These principles of management are not unique to the elderly, and they can apply to individuals with chronic diseases who have high utilization of medical services. The importance of the A-ICU lies in the fact that about 10% of patients consume more than 60% of healthcare services and expenditures and that their careful management can lead to improvement their individual care as well as reduce healthcare costs.

Management of expectations will also be important. Technology and innovation have made diagnoses and treatments safer and more applicable to individuals previously considered too high risk for implementation. For example, endovascular access now makes possible heart valve repair in seniors who would not previously have been considered surgical candidates. The availability of new joints, new approaches to dementia and new cancer therapies, among others, is rapidly shifting the expectations of providers and patients. At the same time, quality of life issues around end-of-life care have been too neglected and, unfortunately, subject to political rancor. Perhaps the most well known example of the discord on this topic was the allegation that yearly discussions with seniors receiving Medicare about “advanced directives” constituted a “death panel.” This position is most unfortunate, since the lack of advanced directives can mean unnecessary and unwanted care along with wrenching debates and discord within families and communities. That the Obama administration removed the requirement for advanced directive discussions for seniors that would have been mandated by the ACA just before it went into law is a testament to how charged this issue has become.

This decision is unfortunate. Here my perspective as a pediatric oncologist bears witness to how important such discussions are with families (an issue recently affirmed by the Association of Clinical Oncology) for adults with cancer (see <http://www.asco.org/ASCOv2/Press+Center/Latest+News+Releases/ASCO+Recommends+Steps+to+Improve+Doctor-Patient+Communication+about+End-of-Life+Cancer+Care>). The need for enhanced palliative care services and providers should be a high priority for academic medical centers and teaching hospitals since they help assure the dignity of individuals at all stages of life, especially when facing a life-threatening disease or condition.

Without question much work needs to be done to adequately address the impact of the elderly on medicine in general and on academic health centers specifically. In 2007 the Institute of Medicine issued a visionary report entitled “Retooling for an Aging America. Building the Healthcare Workforce” (see: http://www.nap.edu/catalog.php?record_id=12089). The recommendations in this report are important, but achieving them is even more challenged in the

current economic environment than in 2007– even as the ranks of the elderly continue to increase significantly, a trend that will persist for the next two decades.

At Stanford we too have much work to do in each of the areas discussed above. Thankfully there is a willingness to begin to address these challenges with the renewed and integrated planning that will define Stanford Medicine. Obviously our progress in this important area of medicine will be a topic for a future Newsletter.

Dr. Linda Shortliffe Completes Her Leadership of the Department of Urology

On March 1st Dr. Linda Dairki Shortliffe will step down as Chair of the Department of Urology, a position she has held for more than 15 years. She announced her decision last summer. Since then search for the next Chair of Urology has been underway under the leadership of Dr. Sherry Wren, Professor of Surgery.

Dr. Shortliffe has attributed her decision to enter medicine in general and surgery in particular to the influence of her parents, who as Japanese-Americans were held in internment camps during World War II. Her father was an engineer but, like many of his generation, he faced discrimination and loss of position and was intent on helping his own children seek career paths that would assure success and security. His message and counsel was heard and taken to heart by Dr. Shortliffe, who has had a distinguished career in medicine and urology. A graduate of Radcliffe College, Dr. Shortliffe did her MD degree and Residency at Stanford and a Fellowship at the Children's Hospital of Philadelphia. She is Board Certified in Urology and Pediatric Urology and has held numerous leadership roles in both fields, including President of the American Board of Urology, President of the Society of University Urologists, Chair of the Urology Society Chairs & Program Directors and Chair of the American Academy of Pediatrics Urology Section. Dr. Shortliffe has also served as a Trustee of the American Board of Urology and Director of the American Foundation for Urologic Diseases.

In addition to important national leadership roles, Dr. Shortliffe has also been the recipient of numerous honors and awards. She has been consistently listed as one of the Best Doctors in America, has received the Asian American Faculty Award from Stanford, is a featured physician in the National Library of Medicine's "Changing the Face of Medicine" series and was named a William and Flora Hewlett Foundation Fellow at the Radcliffe institute Center for Advanced Study at Harvard University.

Please join me in thanking Dr. Shortliffe for her significant leadership at Stanford and nationally over the past decades. We wish her continued success in her future endeavors – at Stanford and beyond.

Given Dr. Shortliffe's plans to step down on March 1st, we have together asked Dr. Joe Presti, Professor of Urology, to serve as the Interim Chair so that we can honor Dr. Shortliffe's time-line and plans. Dr. Presti is well known to the Department, having served in a number of leadership roles in the past for the Department of Urology, the Medical School and the Medical Center. He has agreed to serve in this capacity from March 1st until the time that a new Chair has been appointed and has arrived at Stanford.

The 2011 SUMMA Conference “It’s About Time”

On February 12th the Stanford University Minority Medical Alliance (SUMMA: <http://summa.stanford.edu/>) held its 20th annual program “to increase the diversity in the health professions to better care for underserved communities”. SUMMA is a student-led coalition that brings hundreds of minority undergraduate students who are interested in careers in medicine to Stanford to participate in shared learning and practical workshops on topics like: “Applying to Medical School,” “MCAT Preparation,” “Making Yourself a Better Applicant,” “Women in Medicine,” “Research Pathways and Summer Opportunities,” and “Affording Medical School” among many others. This year’s SUMMA program was organized and led by Fisayo Ositelu, SMS IV, and Joslyn Woodward, SMS III. Together with classmates and undergraduate volunteers they spent countless hours preparing for this very successful event – which was attended by hundreds of minority undergraduate students interested in a career in medicine. The message they conveyed was inspiring and thoughtful and focused on how to be successful.

Having attended a number of past SUMMA events, one of the most memorable aspects are presentations by several Stanford students about their personal journey to medicine. This year’s speakers included Kerry-Ann Stewart, SMS II; Lorenzo Deveza, SMS II; and Wendy Caceres, SMS V. Each offered a highly personal and poignant perspective on challenges they overcame on their journey to become a medical student. In addition to a number of faculty profiles and lectures, one of this year’s keynote speakers was Alexander Red Eagle, SMS VII, an MD/PhD student whose background on Native American reservations shaped his interest in medicine and the research he is now conducting in the Department of Genetics.

Special thanks again to all of the students who contributed to the 20th SUMMA event and to the impact it may have on the careers of future minority students in medicine.

A Refreshing View on Rankings

Over the years I have written all too frequently about the influence and fallacies associated with ranking medical schools, focusing particularly on US News & World Reports (see: http://deansnewsletter.stanford.edu/archive/06_28_10.html#3, http://deansnewsletter.stanford.edu/archive/04_19_10.html#4). Of major concern has been the weight given to size over quality as measured by faculty numbers or the total amounts of funding from the NIH. I have pointed out the fallacies of this weighting and have shared those concerns with you as well as USNWR. I remain hopeful that our recommendations will affect the methodology used by USNWR in future years.

A more refreshing and broadly generalized perspective on the volatility of rankings based on how the metrics are chosen or biased is presented in a recent article by Malcolm Gladwell entitled “The Order of Things” in the *New Yorker* (February 14 & 21, 2011; http://www.newyorker.com/reporting/2011/02/14/110214fa_fact_gladwell). Gladwell illustrates how subjective decisions can influence the rank order of sports cars, universities and law schools (too bad he didn’t chose medical schools). His portrait is amusing as well as informative, and it helps put the issue of rankings in perspective. That said, the human urge to order things – including in hierarchical fashions – seems to run deep, and I suspect that even the logic of

Gladwell won't change the "order of things" to everyone's satisfaction. Put another way, it is important to remind ourselves how volatile and subjective rankings can be – but also how much they appeal to the human desire for order and the "financial impact of things – at least in the profits that the rankings bring to the rating groups (including USNWR).

Introducing Michele Schiele as the Senior Associate Vice President in the Office of Development

In 2010 the School of Medicine passed the \$1 billion mark in the current Stanford Challenge \$4.3 billion campaign that is drawing to completion at the end of 2011. Following the conclusion of the Stanford Challenge, Stanford Medicine (including the School of Medicine and Stanford Hospital & Clinics) anticipates a continuing and enhanced Campaign for Stanford Medicine. In addition, the Lucile Packard Children's Hospital is engaged (with the School of Medicine) in its Breaking New Ground campaign.

In an effort to facilitate collaborations and interactions among the Offices of Medical Development (at SoM), the Office of Hospital Development (at SHC) and the Office of Development (at Stanford University), I am pleased to introduce Michele Schiele, who joined Stanford at the end of January as the new Senior Associate Vice President in the Office of Development. Ms Schiele joins Stanford with a distinguished career in philanthropic funds development. She led two successful fundraising campaigns at the University of Chicago Medical Center (UCMC), both of which exceeded their goals. Under her leadership the Development Office of UCMC grew from 28 to 75 staff members. In 2003, she launched an innovative, well-received event series, Discovery & Impact, through which physicians and researchers share their visions of 21st Century medicine with civic leaders and prospective donors. In 2007 she accepted development responsibility for all of the University's science priorities.

In addition to her work in fundraising, Ms Schiele served as finance director for U.S. Senate and Congressional candidates in Rhode Island, Washington, DC, and Illinois. And as a measure of endurance, she has finished two Chicago Marathons, several triathlons and continues to compete in races with her husband and two sons.

Please join me in welcoming Michele Schiele to Stanford.

The March of Dimes and Stanford Announce a Unique Collaboration

Preterm birth is the leading cause of neonatal death, a major contributor to infant and child morbidity, and the primary determinant of social disparities in perinatal and young child health outcomes in the United States. Moreover, preterm birth has persistently increased in frequency in the United States despite efforts of individual investigators and agencies to identify etiologic factors and interventions to prevent it. It is therefore important and exciting that The March of Dimes Foundation has approved Stanford's application to establish a transdisciplinary March of Dimes Prematurity Research Center at Stanford University School of Medicine. The Foundation is committed to supporting the Center through an initial grant of \$2 million in 2011 with the intent to continue funding through 2020. This is a unique collaboration, and it is a tribute to the

vision and hard work of a number of faculty – and especially Dr. David Stevenson, MD, Vice Dean and Senior Associate Dean for Academic Affairs, The Harold K. Faber Professor of Pediatrics and Professor, by courtesy, of Obstetrics and Gynecology, who will be the Principal Investigator for this project. Dr Gary Shaw, DrPH, Professor of Pediatrics, and Dr. Paul Wise, MD, MPH, the Richard E. Behrman Professor in Child Health, Senior Fellow at FSI and Professor, by courtesy, of Health Research and Policy, will serve as Co-Principal Investigators in collaboration with senior investigators from throughout the School of Medicine as well as the University.

The basic premise of the proposed initiative is that the etiologic pathways of preterm birth involve highly interactive biologic and environmental processes that will not be adequately addressed by the search for singular risks by isolated disciplines. Rather, it is based on a commitment to craft investigational collaborations, integrated datasets, and innovative analytic tools that are capable of generating coherent insights out of complex, intensely interactive pathways of effect. Initial inquiries into pattern recognition, bioinformatics and the human microbiome will be integrated using new technologic capabilities and unique population-based databases to create a pioneering transdisciplinary scientific initiative that leads to the understanding and prevention of the persistent problem of preterm birth.

This is the kind of research that Stanford faculty are uniquely qualified to carry out. This Program is directed at generating and testing new hypotheses and investigational strategies through a highly innovative collaborative transdisciplinary structure that integrates and utilizes powerful new informatics capabilities with an unprecedented array of ethnically-diverse, biologic, clinical, and environmental population-based datasets. Obviously more to follow in the future!

Celebration of the (Future Sarah Donaldson)-Jacob Haimson Professorship in Radiation Physics

On February 10th we had the pleasure of formally celebrating the first endowed chair in radiation physics in the US. The Jacob Haimson Professorship was established in 2008 with gifts from Dr. Sarah Donaldson, the Catherine and Howard Avery Professor, and Dr. Jacob Haimson. Upon Dr. Donaldson's retirement from Stanford (hopefully not for some time), the name of the chair will be changed to the Sarah S. Donaldson and Jacob Haimson Professorship. The first incumbent of the Jacob Haimson Professorship is Dr. Lei Xing, Director of the Division of Radiation Physics in the Department of Radiation Oncology.

The Haimson Professorship brings together a number of important threads in the history of Stanford Medicine. Dr. Haimson first came to Stanford in 1958 at the invitation of Dr. Edward Ginzton, Professor of Physics and collaborator to Dr. Henry Kaplan, the first Chair of Radiation Oncology (and initially Radiology as well), whose work led to the first linear accelerator in the US. Dr. Haimson focused his work on the design of electron microwave linear accelerators, and he is world renowned for his contributions. His collaboration and interactions with Drs. Ginzton and Kaplan not only helped define the field of radiation oncology but also contributed significantly to the strength of the School of Medicine at the time of its move from San

Francisco to the Stanford campus. The ultimate joining of Sarah Donaldson to the Haimson Professorship offers a further connection to the pioneering work of Kaplan and colleagues in the treatment of Hodgkin's Disease – and to Dr. Donaldson's work on pediatric Hodgkin's Disease as well as virtually every aspect of pediatric oncology.

Dr. Xing is a highly acknowledged leader in radiation physics whose work is focused on image guided radiation therapy. He is the co-author of a definitive work on this topic entitled Image Guided and Adaptive Therapy published in 2010.

Please join me in thanking Drs. Haimson and Donaldson and in congratulating Dr. Xing.

Remembering Dr. Gregory A. Feldman, MD, 1977-2010

I did not have the privilege of knowing Dr. Greg Feldman personally during his life, but I quickly appreciated the incredible impact he had on his many colleagues, friends and patients as a trainee in the Department of Surgery at Stanford at the time of his untimely death. Simply put, he was widely recognized throughout Stanford as one of the very finest surgical trainees and physicians as well as an incredibly respected human being. When his Stanford colleagues learned of Greg's sudden and unexpected death in Chicago, where he had gone for additional fellowship training, it sent a shockwave of sorrow, disbelief, guilt and deep mourning through his former colleagues and friends that was deeply felt on many complex levels. The recognition of his enormous promise was immediately coupled with the despair over his act of dying, which served as a grim reminder of how fragile the boundary between life and death can be. On February 9, 2011 a memorial service was held in the Li Ka Shing Center to "Celebrate the Life of Gregory A Feldman, MD, 1977-2010." Resident colleagues, faculty, nurses and his family offered tributes.

An anonymous poem entitled "*A Life That Matters*" expresses a relevant theme for this somber occasion, and I am taking the liberty of including it here:

*Ready or not, some day it will all come to an end.
There will be no more sunrises, no minutes, hours, days.
All the things you collected, whether treasured or forgotten
will pass to someone else.
Your wealth, fame and temporal power
will shrivel to irrelevance.
It will not matter what you owned or what you were owed.
Your grudges, resentments, frustrations,
and jealousies will finally disappear
So, too, your hopes, ambitions, plans
and to-do lists will expire.
The wins and losses that once seemed so important
will fade away.
It won't matter where you came from,
or on which side of the tracks you lived.
At the end, whether you were beautiful or brilliant,
male or female, your skin color wont matter.*

*So what will matter?
How will be the value of your days be measured?
What will matter is not what you brought,
but what you built;
not what you got, but what you gave.
What will matter is not your success, but your significance.
What will matter is not what you learned,
but what you taught.
What will matter is every act of integrity, compassion,
courage or sacrifice
that enriched, empowered or encouraged others.
What will matter is not how many people you knew,
but how many will feel a lasting loss of you when you're gone.
What will matter is not your memories, but the memories
that live in those who loved you.
Living a life that matters doesn't happen by accident.
It's not a matter of circumstance but of choice.*

I thank Dr. Tom Krummel, Emile Holman Professor and Chair of the Department of Surgery, and his colleagues throughout Stanford for bringing the community together for this celebration of life for Dr. Greg Feldman, who lived a life that mattered. The friends of Greg have launched a memorial site in tribute to him: gregfeldmanmemorial.org.

Upcoming Events

Skill Building Workshop: “How to Improve Scientific Writing Skills”

Thursday, March 10th

5:30 – 7:30 PM

Alway Building, M1-112

This workshop, which has been immensely well received, will present six practical techniques to improve clarity and conciseness across all sections of journal manuscripts & grants, and demonstrate why and how to use these techniques. Registration is open to all faculty.

Michaela Kiernan, Ph.D., who will lead this workshop, is a Senior Research Scientist at the Stanford Prevention Research Center (SPRC) at the Stanford University School of Medicine. She received her PhD in social/health psychology from Yale University and has expertise in research methodology and statistics. She is also a standing member of an NIH study section.

Faculty are encouraged to bring postdocs who work with them to increase writing efficiency within their lab group. We hope you will be able to join us! Attendance is limited to 60.

If you are able to attend, please register for this workshop here:

<https://www.onlineregistrationcenter.com/register.asp?m=275&c=5>

Awards and Honors

- **Dr. Larry Steinman**, Professor of Neurology, will be the recipient of the 2011 Charcot Prize, which is awarded every two years for a lifetime achievement in outstanding research into the understanding or treatment of Multiple Sclerosis (MS). Since 1969, the Charcot Award has recognized the significance of Jean Martin Charcot's studies into neurological diseases and his pioneering work, which led him to be among the first to match specific anatomical lesions to a variety of neurological disorders, including MS. The winner is invited to give the Charcot Lecture at the European Committee of Treatment and Research. While I know Dr. Steinman will make the point that his best work is ahead of him it is still wonderful that this prestigious award is also recognizing his past contributions. Please join me in congratulating Dr. Steinman.
- **Dr. David Stevenson**, Vice Dean and Senior Associate Dean for Academic Affairs and The Harold K. Faber Professor of Pediatrics, will receive the 2011 Maureen Andrew Mentorship Award from the Society of Pediatric Research. This award recognizes individuals who have served as exemplary mentors for trainees and junior faculty who have successfully developed investigative careers in the field of child health research. Dr. Stevenson will receive the award at the upcoming Society for Pediatric Research meetings to be held April 30-May 3 in Denver. Congratulations to Dr. Stevenson for this well deserved recognition.

Appointments and Promotions

Tirin Moore has been promoted to Associate Professor of Neurobiology, effective 2/01/11.

Rebecca Smith-Coggins has been appointed to Professor (Teaching) of Surgery, effective 2/01/11.

Dean's Newsletter March 7, 2011

Patient Care, Innovation and Research

One of the most distinguishing features of Stanford Medicine is innovation – in research, education and patient care. Innovations in clinical care not infrequently take place around the diagnosis and management of individual patients, guided by the physician's assessment of the unique clinical presentation of the patient under her or his care. Conventional wisdom suggests that as many as 80% of patients who present with a specific set of clinical symptoms or findings can be treated in a standard or protocol-driven manner. However, a number of patients with complex disorders or a unique presentation require a novel approach that may include the use of a drug or biological agent in an "off-label" fashion or a surgical or interventional procedure that

is uniquely modified or designed for a specific patient. Observations from the care of a single patient can spawn new insights and promote new directions in research and patient care. At Stanford we want to foster a spirit of collaborative innovation to improve the care of an individual patient – but that innovation might also trigger a new direction and even a paradigm shift in medical care. And just as we want to foster innovations in the diagnosis and management of disease, we also want to stimulate innovations that will prevent disease or better define or refine the process of healthcare delivery.

We all recognize that whenever innovation involves patients we must be cognizant of both the ethics surrounding human subjects and the interfaces among standard patient care, innovation and research. These relationships are not linear and sometimes do not follow a logical progression. We certainly do not want to over-manage them, but we do want to be sure that our faculty and medical staff are aware of the boundaries between innovation and research and that we do all that we can to protect the patients we serve and the physicians who care for them.

As I have written in prior Newsletters (see: http://deansnewsletter.stanford.edu/archive/11_22_10.html#2, http://deansnewsletter.stanford.edu/archive/02_22_10.html#4), some guidance is important in defining “innovative care” and determining whether it is best undertaken under specific and limited circumstances or whether it is really “research” and thus best carried out with Institutional Review Board (IRB) approval. Although these distinctions are nuanced, the Task Force led by Drs. Frank Longo, George E. and Lucy Becker Professor in Medicine and Chair of the Department of Neurology and Neurological Sciences, and Norm Rizk, Berthold and Belle N. Guggenheimer Professor in Medicine and Senior Associate Dean, Clinical Affairs, offered these definitions of innovative care and research:

Innovative patient care is care that departs in a significant way from standard or accepted care. The primary purpose for innovative care is to benefit the patient, not to collect data to support a hypothesis or theory. Further, it is expected that innovative care will enhance the well-being of the patient even though it is recognized that there is limited prospective evidence of safety and efficacy.

In contrast:

Research around patient care is defined as an activity (e.g., drug, biological, surgery, procedure) that is designed to test a hypothesis with the goal of collecting data to reach an answer, result or conclusion. This almost always requires an IRB approved protocol since the goal is to seek new knowledge, to reorder existing knowledge or to apply existing knowledge to a new (clinical) situation.

To guide physicians in assessing proposed innovative treatments, the Task Force developed a process that was presented and discussed at the School of Medicine’s Executive Committee on February 4th and that was presented to the Stanford Hospital & Clinics Medical Executive Committee (of the Medical Board) on March 2nd. It will be presented to the Medical Board at the Lucile Packard Children’s Hospital on March 10th. The guidelines recommended by the Task Force can be summarized as follows:

- The process begins with a consultation by the treating physician with the Vice Chief of Staff at SHC or the President of the Medical Staff at LPCH [Med Staff Leader], who will consult with the relevant service chief and Senior Associate Dean for Clinical Affairs (Adult or Pediatric). ***Note that it is the responsibility of the treating physician to initiate the process.***
- If the issues that prompted the consultation are resolved, the process concludes at that point.
- If they remain, the Med Staff Leader convenes a review committee consisting of several standing members plus *ad hoc* members with expertise in the specialty of the proposed treatment. Outcomes of the review may include such recommendations as:
 - The treatment is not innovative and should be considered under an existing privileging process.
 - The physician should consider carrying out the treatment as a research project and developing a research protocol for submission to the IRB.
 - The treatment should not be undertaken at all.
 - The treatment should be undertaken as innovative care for a small number of patients. In this case the Med Staff Leader will continue to provide support and will monitor the outcomes of the treatment.

To monitor this process records will be kept of the requests that come forth including how they are triaged, and how many innovative treatments become research.

The Task Force also developed a Fact Sheet to help physicians and care providers who have questions or concerns. This will be modified over time, but here is what they put together to date:

A Brief Fact Sheet Q&A

Q. Is what I am doing research or innovative care?

A. *Federal regulations define research as a systematic investigation, including research development, testing and evaluation, designed to develop or contribute to generalizable knowledge. The purpose of research is primarily to seek new knowledge, to reorder existing knowledge, or to apply existing knowledge to a new situation.*

In contrast, the primary purpose of innovative care is to benefit a patient(s), not to collect data to support a hypothesis or theory. Innovative care is a non-standard procedure or treatment that is solely attempted to enhance the wellbeing of a patient. Innovative care is sometimes called 'nonvalidated' treatment, since it has not been formally evaluated for safety or effectiveness.

Q. What kind of oversight is required for research?

A. *Procedures and therapies that are determined to be research require review by the Institutional Review Board (IRB) in the Research Compliance Office. If you are uncertain if your proposed treatment should be considered research, contact the IRB to ask or begin with a consultation with the appropriate Medical Staff Leader (Vice Chief of Staff for SHC and President of the Medical Staff for LPCH).*

Q. What kind of review and monitoring is required for innovative care?

A. *Innovative care requires engagement with the Medical Staff Organization. For innovative*

therapy/procedures that present a significant increase in risk over other acceptable alternatives or if the therapy/procedure is so novel or unique that it is not possible to evaluate the risk or benefit, a consultative committee of the Medical Staff Organization will be organized to review the reasonableness of the proposed treatment and the patient's situation, and to make recommendations to the Medical Staff Organization and to you.

Q. Does every procedure that deviates from the 'Standard of Care' require oversight?

A. Whenever you plan a treatment or procedure that is significantly different from the accepted Standards of Care, you should consult with the appropriate Medical Staff Leader (Vice Chief of Staff for SHC and President of the Medical Staff for LPCH). . The Medical Staff Organization, in consultation with the appropriate Senior Associate Dean for Clinical Affairs (Adult or Pediatric) and the relevant service chief, is ultimately responsible for determining what kind of monitoring, support or oversight (if any) your activity requires.

Q. What if my approved innovative treatment/procedure is successful and I want to repeat it?

A. If you want to repeat the treatment beyond the number of times initially authorized, you should consult with the appropriate Medical Staff Leader, who will consult with the Committee that initially reviewed your treatment plan under these guidelines. The Committee will consider whether the treatment should no longer be considered "innovative." If so, the Credentialing and Privileging Committee will be asked to develop privileging criteria in consultation with the appropriate service and/or division chiefs. However, you should continue to follow these guidelines for approval of further treatments pending establishment of those privileging criteria. Alternatively, the Committee may recommend to the Credentialing and Privileging Committee that any further treatments would be best undertaken as research carried out with IRB approval. The Credentialing and Privileges Committee will make the final determination about continuing the treatments.

Q. What if I want to publish the outcome of or describe the procedures I've done in a medical journal article?

*A. The Federal Office of Human Research Protections (OHRP) has said that "the intent to publish is an insufficient criterion for determining whether an activity involves research." Planning to publish an account of an activity does not necessarily mean that the project fits the definition of research. People seek to publish descriptions of clinical activities that are not research for a variety of reasons. In fact, Kennedy and Eaton (2007)*_feel that "all innovating physicians should assume a duty...to educate about the impact of their changes on patient care." They go on to say that "If formal research is not conducted...the least that innovating physicians can do is to collect outcome data on their patients and use it to inform themselves and other physicians."*

* Eaton, Margaret L. and Donald Kennedy. *Innovation in Medical Technology. Ethical Issues and Challenges.* Baltimore: Johns Hopkins Press, 2007.

This Q&A is not inclusive and both it and the guidelines will evolve over time. Importantly, we are interested in your comments and reactions. Please send them to Kathy Gillam, Senior Advisor to the Dean, at k.gillam@stanford.edu, so that they can be shared with the Task Force. The actual Innovative Care Guidelines will be available in their entirety on line in the next

weeks, and if, after reviewing them, you have further reactions, please do share them with us. I want to again thank the leadership of Drs. Longo, Rizk and Gillam and the outstanding task force members for their work on this important issue. In closing, I want to underscore that our goal in developing these guidelines is to emphasize our commitment to fostering innovation while doing all we can to protect patients and those providing their care.

Healthcare Reform and New Models for the Delivery of Patient Care

Much has been written about the impact of healthcare and its reform, including in past issues of this Newsletter. At Stanford we have put together a Healthcare Reform Planning Committee with the goal of developing novel approaches to healthcare delivery. The group includes leadership from the School of Medicine, Stanford Hospital & Clinics and the Lucile Packard Children's Hospital, and it receives critical input from clinical department chairs and faculty. We also benefit from the new Clinical Research Excellence Center that Dr. Arnie Milstein leads and that will develop important partnerships with other leaders in the University (especially from the Business School and the School of Engineering). The primary task of the group is to consider ways of improving clinical care delivery that is coupled with innovation, clinical excellence, and outstanding quality, safety and patient experience, and that achieves these goals with attention to cost and value.

Over the last months we have been engaged in discussions with the Stanford University Benefits Group led by Randy Livingston, Vice President for Business Affairs, and Less Schlaegel, Associate Vice President for Benefits. This planning group has faculty and staff leadership representation and has been focusing on improving the health of Stanford University employees and dependents while also being attentive to controlling and slowing the costs of healthcare – which have continued to rise at an unsustainable pace. Given this financial reality, and coupled with the expectation that various components of the 2010 Affordable Care Act (ACA) will be instituted between 2011-2018, it is imperative that we all be proactive in planning for the future. A presentation of the impact of the ACA on faculty and staff benefits was given to the University Academic Senate on February 17th by Randy Livingston and Arnie Milstein, and their comments are available at the website for the Faculty Academic Senate (see: <http://facultysenate.stanford.edu/>).

In his presentation to the Academic Senate as well as to the Council of Clinical Chairs on February 25th, Dr. Milstein highlighted some of the unique ways in which Stanford faculty, in conjunction with SHC and LPCH, could develop a distinctive model of care based on its special expertise and on the recognition that in most populations approximately 10% of the patients account for 60% or more of the healthcare costs. These are often medically unstable chronic illness patients. Before joining Stanford, Dr. Milstein developed a unique model to care for such patients that has been described as an “Ambulatory ICU” – not because it comprises intensive care *per se* but rather because it uses an efficient care delivery system that, like an inpatient ICU, is available to high-risk patients 24/7. This system is based on a close relationship with the patient's main care provider and selected specialists. It has been successfully employed in several ambulatory settings, including at least one academic center. A readable description of this model appears in the January 17th issue of *The New Yorker* by Dr. Atul Gawande and is entitled “*The Super-Utilizers*” (see: <http://www.newyorker.com/online/blogs/newsdesk/2011/01/atul-gawande-super-utilizers.html>).

Dr. Milstein proposes that we establish an A-ICU at Stanford that will offer 24/7 care to Stanford employees who are likely to benefit from this model. These individuals would be cared for by defined clinicians who would focus on keeping them well and out of the hospital by coordinating care and using “design discipline” approaches to affect change in patient behavior.. Dr. Milstein and our team are in the midst of identifying the care providers, and the Stanford benefits group will be responsible for identifying the patients with the goal that this will be available in 2012. While this will be a data driven pilot experiment, we have every intent of seeking ways to extend the model to other regional employers.

Clearly this is just one example of how we will respond to the changing landscape of healthcare reform. There will be countless others – but in the end we will seek to the best of our ability to define approaches that capitalize on what makes Stanford Medicine unique and that focus on how we can shape the future rather than just react to it.

Changes Coming in the MCAT Exam

The Medical College Admissions Test (MCAT) is well known to undergraduates contemplating application to medical school and is actively used by nearly every medical school admission committees as one of the tools to guide admission. Interestingly, the format of the MCAT in use today was introduced in 1991 – twenty years ago. While this test measures knowledge across a number of domains, it has a number of limitations and may not be well suited to assessing all the qualities needed to be an excellent physician.

In the January 25, 2010 issue of this Newsletter I gave a preview of the work underway in revising the MCAT under the auspices of the MR5 Committee of the AAMC (see: http://deansnewsletter.stanford.edu/archive/01_25_10.html#4). The MR5 is a 22-member advisory committee that was appointed in 2009. Dr. Steven Gabbe, Senior Vice President for Health Sciences at The Ohio State University and Chair of the Committee, provided an update on its work at the February 24th AAMC Board of Directors meeting, which I attended. The committee will preview its recommendations at the 2011 Annual Meeting, after which they will make a final recommendation to the AAMC. At the same time, the MR5 Committee has been quite transparent in sharing its thinking and planning and in soliciting comment from medical schools and the broader community.

The major goals of the MR5 are to develop a new MCAT that identifies students who are academically qualified to succeed in medical school and beyond. There is also a strong desire to better identify students who have the personal characteristics to make them excellent professionals. I certainly concur that these are important objectives, but I pointed out in the discussion that a broader cultural transformation is also needed. In fact, most incoming medical students have the altruistic and humanistic values that make for excellent physicians, but these important attributes get blunted during medical school, residency training and beyond. Thus, if we want to develop highly knowledgeable physicians who are also humanistic and professional, considerable work needs to be done to improve these values among our residents, fellows, faculty and community colleagues.

While the MR5 work is clearly “in progress,” one of the intriguing aspects of Dr. Gabbe’s presentation was the possibility that in the next MCAT exam equal weight will be given to knowledge in the biosciences, physical sciences, critical analysis and reasoning and the behavioral and social sciences. The critical reasoning section could have questions, problems and scenarios similar to the ones being used this year in our “Multiple-Mini Interview” process for medical student admissions, which also test reasoning in different domains. (see: http://deansnewsletter.stanford.edu/archive/11_08_10.html#4 and <http://med.stanford.edu/ism/2011/january/interview-0110.html>).

There will be more to share in November after the AAMC meeting. At this point the earliest date the new MCAT could be in use is 2014.

US Economics and the NIH

While the actual budget numbers for FY11 and FY12 for science and technology, including biomedical research, are still uncertain, there is considerable and understandable concern and anxiety about how they will play out. While the President’s budget proposal for FY11 called for a 3.2% increase in the NIH budget (to \$32.007 billion), this is most unlikely, especially since the FY House Continuing Resolution calls for a 5.2% decrease (to \$29.376 billion). The potential impact of such a decrease would be even greater than it would otherwise be since it would be implemented halfway through the year, prior to the end of September of 2011. The showdown underway in the Congress leaves the entire discretionary budget (including NIH, NSF and other agencies) at a very concerning point. And while the President’s budget for NIH for FY12 (which begins October 1, 2011) proposes the NIH budget at \$31.7 billion, all bets are off since the budgetary battles are likely to be fierce. Obviously our various advocacy and professional organizations continue to emphasize the positive impact of investments in science, innovation and technology. But the focus on the national debt and the fierce divides between the Republicans and Democrats pose major threats and challenges.

I have noted in prior Newsletters that our faculty have competed well for NIH and other grants and that we have been judicious in our investments (see: http://deansnewsletter.stanford.edu/archive/01_10_11.html#1), but there is no denying that the years ahead will be extremely challenging and will require even more judicious financial management as well as efforts to find new or additional sources to support our mission in research. I remain confident that we will succeed given the excellence of our faculty and students – but it will be a time of serious challenge.

Graduate Student Admissions and Stanford Diversity

The last days have brought hundreds of potential PhD students applying to the Bioscience Graduate Programs to campus for interviews, meetings and tours. I have heard from a number of faculty how pleased they are with this year’s applicants. I was also pleased to note that this year the Biodiversity Event went “mainstream” and was included as part of a luncheon event for graduate students. The message was clear: diversity is part of our mission and culture and not a separate event or grouping. Special thanks for hosting this event go to Dr. Melanie Bocanegra, our newly appointed Assistant Dean for Graduate Education and Director of the Biosciences Diversity Program. The luncheon event featured a wonderful presentation by Dr. Carlos Bustamante, Professor of Genetics, who joined Stanford a year ago and who offered his

perspective on why it is such an extraordinary institution. This was complemented by an exciting presentation from Antonia Dominguez, President of BioAIMS and PhD student in Genetics. Thanks also to the various groups who participated in the Diversity Mini-Resource Fair. It was a day when Stanford Biosciences shined brightly.

A Perspective from the UK on Postdoctoral Scholars

I suspect that the “World View” Perspective by Dr. Jennifer Rohn, a cell biologist at University College London in the March 3rd issue of *Nature* will engender a range of views and reactions. Entitled “Give Postdocs a Career, Not Empty Promises” (see <http://www.nature.com/news/2011/110302/full/471007a.html>), Dr. Rohn addresses concerns that are global and that relate specifically to postdocs in the biosciences. While her basic thesis is that a viable career pathway for postdocs or bioscience graduates in research staff positions should be developed, she also touches on the important issue of the numbers of individuals being trained for too few jobs over too long a period of time. A number of these themes were touched on in our July 17th Think Tank on Postdocs (see: http://deansnewsletter.stanford.edu/archive/07_26_10.html#2) and in our January Leadership Retreat (see: http://deansnewsletter.stanford.edu/archive/01_24_11.html#1). While the proposals by Rohn are important, they are not new and will need to be considered in the broader context. But Dr. Rohn’s perspective is certainly worth reviewing.

Bike Safety: Yes and No

It was nice to learn about the student sponsored “Helmet Hookup” event that was held on February 25th, in which students promoted the use of bike helmets by fellow students. Elise Marie Geithner, ASSU Chair of Campus Organizing, is leading this effort. And we always appreciate the work of Ariadne Scott and her office on Bike safety. I am also pleased that a number of our medical students, led by Anthony Kaveh (SMS I) are eager to take on the issue of bicycle safety on campus. These are all good things.

At the same time, it is concerning to see students dressed in blue scrubs or white coats riding bikes without helmets or lights. And I must admit that every night when I drive the short distance to our campus home I encounter multiple student bikers whom I put in the “near miss” category. By this I mean students who ride recklessly, never stop at traffic signs, cross in front of moving vehicles and often have neither helmets nor lights. The lack of lights remains one of the biggest safety hazards.

So while I am encouraged by student-to-student engagement, bike safety on campus remains an ongoing and I think still major health and safety problem. I realize I have written about this frequently and also tried various advocacy approaches, none really having the kind of impact one hopes for. But it is still worth trying!

Upcoming Event

Mind Bugs: The Ordinary Origins of Bias, Dr. Brian Nosek

Thursday, March 17, 2011
4-6 pm
Munzer Auditorium, Beckman

Dr. Brian Nosek is a renowned social psychologist and scholar of unconscious bias, i.e. thoughts and feelings that are outside of a person's conscious awareness. In this talk, Dr. Nosek will explain what research has to say about where unconscious biases come from and how to measure them. He will also discuss how such biases can affect our perceptions, thinking, and behavior. His talk will explore the implications of unconscious bias on real-world behaviors such as hiring and evaluation decisions.

Please register for this event at:

<https://www.onlineregistrationcenter.com/register.asp?m=275&c=6>

Awards and Honors

- A special thank you to the SMSA (Stanford Medical Student Association) and the Gardner Mentorship Fund for hosting a reception for faculty who have served as mentors for students. This is all the more special since students initiated it, and I am sure it was very meaningful to faculty who work hard to guide and mentor students.
- The recipients of the 2010 School of Medicine SPIRIT Award and the new Inspiring Change Award were announced this week and will be formally celebrated (along with our valued staff) at the Recognition Celebration on Friday May 20th in the Li Ka Shing Center for Learning and Knowledge from 4-7 pm. This years SPIRIT recipients include:
 - **Chris Shay**, Project Manager/Planner for the Office of Facilities Planning and Management and
 - **Vuong Quoc Vu**, Human Health and Disease Coordinator for the Department of Pathology

In addition, the winners of Inspiring Change Leadership Awards include

- **Sonia Barragan**, Associate Director, Research Management Group and
- **Nancy Lonhart**, Associate Director and Administrative Manager for the Department of Medicine and PCOR

Congratulations to each – they are incredible individuals.

- **Dr. David Spiegel**, The Jack, Samuel and Lulu Willson Professor in Medicine, has been awarded the 2011 Arthur M. Sutherland Award from the International Psycho-Oncology Society (IPOS). This award "honors an IPOS or psycho-oncology community member with a lifetime achievement in the field of psycho-oncology. This is a late career award and recognizes sustained and distinguished output in psycho-oncology over their whole career. This is the Society's most important award and reflects the international standing of the recipient." Congratulations to Dr. Spiegel.
- **Dr. Abraham Verghese**, Senior Associate Chair for the Theory and Practice of Medicine, was honored at a special event hosted by Dr. Linda Boxer, Interim Chair of the Department of Medicine, for a unique honor. In addition to his many other talents, Dr.

Verghese is a world-renowned writer of non-fiction and fiction. The most recent event celebrated the fact that his novel, *Cutting for Stone*, has been on the New York Times Best Seller List for more than a year. While Stanford faculty boast many honors, few will achieve this one. And while I don't want to convey this as marketing, if you haven't read *Cutting for Stone* you should. It is fantastic!

- **Dr. George Yang**, Associate Professor of Surgery, has been elected President of the Society of University Surgeons. He will assume office in Feb 2012 and deliver his Presidential Address at the Society meeting in Feb 2013. The SUS presidency is a singular honor; please join me in congratulating Dr. Yang.
- **Stephanie Weber**, PhD candidate in Biochemistry, is one of 12 students who has been chosen to receive the 2011 Harold M. Weintraub Graduate Student Award sponsored by the Basic Sciences Division of Fred Hutchinson Cancer Research Center. Nominations were solicited internationally; the winners were selected on the basis of the quality, originality and significance of their work. The recipients, all advanced students at or near the completion of their studies in the biological sciences, will participate in a scientific symposium May 6 at the Hutchinson Center consisting of scientific presentations by the awardees. Congratulations.
- **The Glenn Foundation for Medical Research** has awarded a \$5 million grant to Stanford University to launch a new center on the biology of aging, focusing on the role of stem cells in the aging process. **Thomas Rando, MD, PhD**, Professor of Neurology and Neurological Sciences, will serve as the director of the new laboratories. **Steven Artandi, MD, PhD**, Associate Professor of Hematology, and **Anne Brunet, PhD**, Associate Professor of Genetics, will serve as associate directors.

Appointments and Promotions

Arlina Ahluwalia has been promoted to Clinical Associate Professor (Affiliated) of Medicine, effective 1/1/2011.

Ingrid Bossen has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2010.

K.S. (Casey) Crump has been reappointed as Clinical Assistant Professor of Medicine, effective 10/1/2010.

Christopher Gonzalez has been reappointed as Clinical Assistant Professor of Pathology, effective 1/1/2011.

Kevin Graber had been reappointed as Clinical Assistant Professor of Neurology & Neurological Sciences, effective 4/1/2011.

Stephen Harris has been promoted to Clinical Professor (Affiliated) of Pediatrics, effective 3/1/2011.

Paul Helgersen has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 11/1/2010.

Gary Hsin has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 1/1/2011.

Annie Hsu has been promoted to Clinical Assistant Professor of Radiation Oncology, effective 2/1/2011.

Robert T. Isom has been appointed to Clinical Associate Professor of Medicine, effective 3/1/2011.

Amul Jobalia has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 2/1/2009.

Michael S. Krathen has been appointed to Clinical Assistant Professor of Dermatology, effective 8/1/2011.

John Kugler has been promoted to Clinical Assistant Professor of Medicine, effective 1/15/2011.

Wilma Lee has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2010.

Jin (Billy) Li has been appointed to Assistant Professor of Genetics nter, effective 3/01/11.

June Lugovoy has been reappointed as Clinical Associate Professor (Affiliated) of Medicine, effective 9/1/2009.

Jana Mannan has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2010.

Fernández-Viña, Marcelo has been appointed to Professor of Pathology at the Stanford University Medical Center, effective 2/01/10.

Sean McGhee has been appointed to Clinical Assistant Professor of Pediatrics, effective 3/1/2011.

Madhur Rani Saxena has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 3/1/2011.

Nigam Shah has been appointed to Assistant Professor of Medicine, effective 3/01/10.

Vanila M. Singh has been promoted to Clinical Associate Professor of Anesthesia, effective 1/1/2011.

Annie Talbot has been promoted to Clinical Assistant Professor of Medicine, effective 2/16/2011.

Wendy Bick-Ling Wong has been promoted to Clinical Associate Professor of Pediatrics, effective 2/1/2011.

Dean's Newsletter

March 21, 2011

The 2011 Stanford University School of Medicine Match Results

Milestone events can be transformative. Life choice milestone events are usually carefully weighed and calibrated, and most of us balance the pros and cons of each choice. In medical education and training one milestone event stands in contrast – the Annual National Residency Match. While students in the Match in this and other countries will have individually weighed their choices, preferences and even dreams as they constructed and then submitted their personal “match list” in February, they all found out on March 17th at exactly the same time (calibrated to the same moment around the country and around the world) which residency program they matched to – and where they will begin the next phase of their training in June and July. The Match has been in place since 1952, originally at the request of medical students, and is the result of a computerized mathematical algorithm that aligns the preferences of the applicants with the preferences of residency programs at US teaching hospitals – to create “the Match.”

Across the US, the 2011 Match offered 23,421 first year and 2,737 second year residency program positions – 95% of which were filled. Those taking the positions include graduates of US allopathic and osteopathic medical schools as well as “off-shore” and international schools. Overall 30,589 individuals applied to the 2011 Residency Match. Slightly more than 94% of graduates of US medical schools matched to a first year residency program (the total being just over 15,558), and 81% of these students matched to one of their top three choices.

At Stanford 91 students participated in the Match, and I have included the results below for those who have given permission to share the news publicly. From our perspective, the outcome of this year's Match was wonderfully successful. Overall, 86% received one of their top three choices (a pattern that has been similar in past years). Approximately 30 of the students will be staying at Stanford for their residency, 9 will move slightly north to UCSF and 8 will make the sojourn to one of the Harvard teaching hospitals. While students will relocate to some 14 states, nearly 80% will be in California, Massachusetts, New York, Washington or Maryland – with the vast majority staying in California.

On a national level, recent trends for specialty selections have continued, with dermatology, orthopaedic surgery, otolaryngology, plastic surgery, radiation oncology, thoracic surgery and

vascular surgery being among the most competitive fields. For the sixth year in a row the number of seniors pursuing emergency medicine increased, this year by 7%.

For our 91 Stanford students, the most frequent choices for residency are Internal Medicine (21 students), Radiology (10 students), Emergency Medicine (8 students) and Anesthesia (7 students). But as you can see from the list that follows, our students have chosen a wide variety of medical specialties to pursue in the next phase of their careers.

Stanford students are also distinguished by the fact that many pursue training and research opportunities in addition to an MD degree and thus spend more than the 4 traditional years in medical school. This year 59% of our graduating students have spent 5 or more years at Stanford.

<i>Zambricki, Elizabeth Anne</i>	Stanford Univ Progs-CA	Otolaryngology

Of course Stanford teaching hospitals also host the Match for a diverse array of residency programs and attract outstanding students from across the nation – in addition to our own Stanford graduates. Reports from each of the programs indicate outstanding results – not only in the quality of the students who will be joining us in June and July but, importantly, in their diversity. This makes the results even more wonderful.

Changes Coming in Graduate Medical Education

Graduate Medical Education (GME), which includes residency and clinical fellowship training, is one of the most important learning experiences for doctors. It also helps differentiate medical school graduates into the complex array of primary and specialty care providers. Depending on the specialty, GME adds anywhere from a minimum of three years to upwards of 8-10 years of additional training beyond medical school. It is often viewed as one of the most intensive experiences of training in the life of a doctor, and it is a period filled with history and tradition as well as complex balance of service versus education. Over the years, the proportionality of many residency programs has shifted too strongly toward service obligations, with long hours of inpatient care coupled with often intense and not infrequently competing demands and expectations. Hospitals, training program directors, clinical faculty, resident and fellow trainees and students have quite different perceptions about GME. In addition, the perceived values of GME are confounded by the economics of healthcare delivery, the role that residents play in the care and management of complex patients and the amount of time devoted to their education and professional development.

Although the full extent of the changes in GME that are on the horizon is yet to be defined, it is clear that changes are coming, some quite fast. During the past decade, considerable focus has been placed on the consequences of medical errors related to sleep deprivation – an issue linked to the historically long on-call schedules of residents. These have evolved over the years – from the every-other-night and sixty consecutive hour in-hospital on-call schedule that existed when I was in training (of course, now decades ago) to every third and then every fourth night of call. This changed dramatically in 2003 when the Accreditation Council for Graduate Medical Education (ACGME) mandated a maximum average of 80 hours per week for residents' work hours. While this began to change the schedule of training, an equally dramatic shift is about to unfold this summer with additional changes, many emanating from the 2008 Institute of Medicine (IOM) report on Resident Duty Hours: Enhancing Sleep, Supervision and Safety (<http://iom.edu/Reports/2008/Resident-Duty-Hours-Enhancing-Sleep-Supervision-and-Safety.aspx>).

While the IOM report was broadly debated, the ACGME has now issued its new approved duty hours, which become effective in July 2011 (see: http://www.acgme.org/acwebsite/dutyhours/dh_index.asp). Among the most dramatic of these is the new standard specifying that interns (first year residents) cannot work longer than 16 consecutive hours – making the traditional “overnight on-call” schedule obsolete. Residency programs across the nation – including at Stanford – are about to undergo major changes in how and where residents work and learn. Several of the models being proposed were discussed at the Medical School Faculty Senate on Wednesday March 16th; each has broad institutional and individual impacts and implications. While there is no question that these regulations must be followed, systems to assure effective “hand-offs” between multiple physician care providers (including residents, attending physicians and other care providers) constitute an important challenge that must be successfully met to assure patient care and safety. Coupled with this is the need to assess the impact of these changes on resident education – as well as the locus and types of care, service and education they will experience.

In tandem with the changes in resident duty hours are even bigger potential changes in the assessment and expectations for GME. These include the balance of training programs in primary care and subspecialties, whether care should move from the in-patient to other sites of care (ambulatory, community) and also how the balance between education and service should be determined. Equally important is the need to assure that the principles of quality, safety and patient satisfaction – along with evidence based outcomes – are better incorporated into GME. The emerging issues of healthcare delivery, including its costs, will need to be incorporated into the future of GME. Also underpinning the debate is the cost for GME – which today is largely paid for with public dollars through Medicare or discretionary federal funds for children’s hospitals. Needless to say, with the economic pressures facing the nation, including its entitlement programs, there is increasing scrutiny on the public funding of GME and questions about whether this funding should be continued. The consequences of these debates have enormous implications. No decisions have yet been made, but it is certain that major changes are forthcoming.

A number of national organizations have come forth with recommendations for changes in graduate medical education. Notable among these is the recent report from the Josiah Macy Jr. Foundation in conjunction with the Association of Academic Health Centers (see: <http://www.josiahmacyfoundation.org/>), whose recommendations will almost certainly impact the future of GME in important and considerable ways. The major recommendations of the Macy/AAHC Report include:

1. An independent external review of the governance and financing of the GME system (A specific recommendation is that the Congress should charge the Institute of Medicine to perform this critical review.)
2. Enabling GME redesign through accreditation policy. (Specifically, the external review of GME should make recommendations to the ACGME to ensure that the accreditation process is structured and functions in a way that best serves the interest of the public, the training programs, and the trainees.)

3. Ensuring adequate numbers and distribution of physicians: implications of GME. (Specifically, the review should address how GME is currently financed and make recommendations about how it can be better structured to meet the broad challenges of GME and healthcare.)
4. Providing trainees with needed skill sets: innovative training approaches and sites.
5. Ensuring a workforce of sufficient size and specialty mix.

It seems clear that, with the changes proposed above and many others that are being considered, GME will evolve considerably in the years ahead. While it seems likely that there will continue to be a Resident Match in the years to come, it also seems likely that the experiences, education and career pathways of future residents and the medical facilities responsible for them, will change considerably – and hopefully for the better.

From Postdoc to Innovator

Dr. Rania Sanford, Assistant Dean for Postdoctoral Affairs, informed me of an exciting interactive forum sponsored by the postdoctoral leadership of AIMS (Association of Industry-Minded Stanford Professionals) in collaboration with the School of Medicine Career Center (see: <http://med.stanford.edu/careercenter/>). Dr. Sanford noted that on the evening of Wednesday, March 16th, over 120 postdocs gathered at the Clark Center to hear Chris and Pamela Contag's advice in a talk titled "*From Postdoc to Innovators.*" The Contags, who co-founded Xenogen, gave an informative and lively talk, by invitation from AIMS, a new postdoc group with interest in entrepreneurship and industry (<http://aims.stanford.edu>). Many postdocs find themselves at a career juncture and wonder how to recognize and pursue the opportunities that might be available to them across a spectrum of life-long possibilities. AIMS and the Career Center have initiated informative programs by bringing to campus several of our former postdocs, now successful industry leaders and venture capitalists, to share their wisdom and insights with our current trainees. In addition to thanking the Career Center I want to also acknowledge some of the postdocs who have helped to launch AIMS, including Irfan Ali-Khan, Navaline Quach, Stéphane Boutet, Mambdidzeni Madzivire, Andrew Razgulin, Michael Kertesz, Keren Ziv, Tobi Schmidt, Hyejun Ra, and Shi Ming Xu. Look for future programs.

High School Students Get a Glimpse of Careers in Medicine

On March 18th, for the fifth consecutive year, the School of Medicine Office of Communication and Public Affairs, hosted Med School 101, which brings hundreds of local high school students to campus for a glimpse into medicine and science broadly and careers as a doctor more specifically. Berg Hall in the Li Ka Shing Center for Learning and Knowledge was filled with hundreds of eager and excited students – each of whom rapidly raised their hand when asked if they hoped to attend medical school. While certainly the career paths and choices will change for many, it is exciting to note that a career in medicine still captures and even inspires the rising generation. During the day-long event students interacted with each other as well as with faculty, students and residents to consider a range of different topics such as:

- Mind control – for better living
- To sleep, perchance to dream...but why?
- Young at heart; More than sad: Teens and depression

- The evolution of Darwin
- Virtual medicine: To the ER, STAT?
- So you wanna go to med school?
- Transformers: How stem cells are revolutionizing medicine
- Hot shots: the truth about vaccines
- Fit into your genes

It is our hope to continue to inform and inspire our community of learners about medicine and science. I am very grateful to the Office of Communication and Public Affairs for this annual program – and for our dedicated students, trainees and faculty for teaching and exciting the next generation of doctors.

The Dangers of Sharing Too Much Information

A recent event in which a student posted information on a blog that unintentionally compromised patient privacy prompts me to remind all of us about the vulnerability of sharing too much information in public and social media sites. In recent years the opportunities for social networking have been transformative, but they include the fact that the boundaries between personal and professional information are easy to blur at the edges. While virtually everyone in my family uses Facebook, I have avoided doing so for fear that information I would prefer to keep out of the public arena would not be protected. When a student or trainee becomes a “friend” on a social media network, there is a risk that information he or she shares about personal experiences with patients – even when anonymous – can be seen by others as infringing on their privacy.

According to Dr. Laura Roberts, Katherine Dexter McCormick and Stanley McCormick Memorial Professor and Chair of the Department of Psychiatry, who participated in the investigation of the student infraction, this is becoming a major issue in medicine – with big implications for all fields and perhaps in particular to mental health. The main goal of my comment here is to heighten awareness of the importance of care and scrutiny of communications and information we share in any public media. Dr. Roberts indicated that her professional societies will be enacting recommendations regarding the benefits and risks of physicians and social networking – a topic that will certainly be before us for many years to come. Dr. Roberts also recommended a number of relevant articles for broad review and interest – a few of which include:

- Greysen, SR. Online Professionalism and the Mirror of Social Media. *J Gen Inter Med.* 2010; 24; 1227
- MacDonald, J. Privacy, Professionalism and Facebook: A Dilemma for Young Doctors. *Medical Education* 2010;44: 805
- Koch, T: The Ethical Professional as Endangered Person: Blog Notes on Doctor-Patient Relationships. *J Med Ethics* 2010: 36:371

This is an important matter and something we all need to consider and pay careful attention to. The slope can be slippery and can result in unintended harm – with potentially serious consequences to individuals and institutions.

The Annual Ranking by USNWR

Hardly a year has passed without a comment (and sometimes rant) in this Newsletter about the annual ranking of medical schools by USNWR (US News and World Report) and, in particular, the concern that the metrics that have been employed give too much weight to size over quality. This has been particularly true for the heavy emphasis on total NIH funding – which is influenced by faculty size and thus impacts negatively on smaller schools like Stanford. More importantly, I have expressed concern over the years that the focus on total NIH funds created the pursuit by many medical schools and university leaders to increase faculty size and research facilities so that they could “rise in the NIH funding levels” and thus do better in the annual USNWR rankings. My concern has been that such a focus on size over quality (better measured by the amount of peer-reviewed NIH funding per faculty member or principal investigator) could create a financial threat to medical schools when NIH funding becomes constrained – as is now the case. And indeed a number of medical schools that have simply stretched too far in the past decade in faculty recruitment and resource commitment are now facing serious economic challenges and, in some cases, serious deficits.

Accordingly, I am pleased to note that this year USNWR has revised its metrics to give equal weight to total institutional NIH support and NIH support per faculty member. This is more similar to what has been done for Schools of Engineering. With that change, Stanford’s rank in the 2011 USNWR ranking of research medical schools is #5 (where it is tied with Duke, UCSF and Yale). This is a major change from the 2010 rank – but this should not be viewed as a change in Stanford. While I would like to think that we get better year after year, such big swings in ranking only reflect the way the metrics are scored. Indeed, I reflected on this in the February 22nd Dean’s Newsletter (see: http://deansnewsletter.stanford.edu/archive/02_22_11.html#5), where I referred to Malcolm Gladwell’s amusing but insightful commentary on how rankings can be influenced by subtle changes in the metrics that are chosen and employed. You might enjoy his article entitled “The Order of Things” in the *New Yorker* (February 14 & 21, 2011; Summary of article http://www.newyorker.com/reporting/2011/02/14/110214fa_fact_gladwell).

It would be disingenuous to say that I didn’t care about rankings – since I am well aware that comparative scores impact our applicants, students, faculty and community. At the same time, I care more deeply about whether the metrics employed accurately reflect the attributes purportedly being measured and compared. That is why, for instance, I believe that the peer-reviewed funding per faculty member as well as other metrics that define the true peer reviewed academic success of students and faculty are much more important than institutional funding. Consequently, I am pleased that USNWR has changed its metrics to put a greater emphasis on quality, and I hope that this will stimulate all of us to make that our priority moving forward. It is the quality and success of our faculty and students that really distinguish an institution.

Leadership Changes in Medical Development

In December 2009 I was pleased to announce the appointment of Laurel Price Jones as our Associate Vice President for Medical Development. She joined Stanford officially in January 2010 and during the past year helped medical development achieve a number of important milestones – in annual giving, new activity and major gifts. At the six-month mark of the current FY11 fiscal year, OMD has booked more than half of our cash goal of \$140 million and half of

the new activity goal. We are grateful for these results, which reflects the work of our excellent staff and leaders in Medical Development. Thus it is with mixed feelings that I share the message Ms. Price Jones sent out this past week:

I write with mixed feelings to let you all know that I am in the process of returning to Washington. I have enjoyed working with such a talented, dedicated, and collaborative group of development professionals, within OMD and beyond. The faculty and the leadership of the Medical School have been welcoming and supportive, and they bring transformational ideas to the table every day, making fundraising for Stanford Medicine so very satisfying. It has been an honor and a privilege to be associated with this great University.

There is a confluence of forces that motivate my desire to return to the DC area. My husband Rhys continues to teach full-time at The George Washington University, having found only part-time work in this area. His weekly commute to Palo Alto is tiring and not much fun. Our home in Alexandria remains unsold and ready to go back into action as the family home. But, most important, our oldest daughter -- who lives and teaches in Washington -- is expecting twins (our first grandchildren) in early June; and our middle daughter has just accepted a position in New York and will move from Galesburg, Illinois, to Brooklyn -- also in June.

Dean Pizzo has been aware of these forces and is supporting me in this process by providing a leave of absence. Barbara Clemons has agreed to act in my absence as the interim AVP from March 18. Also supporting my decision is the fact that Michele Schiele brings such a wealth of experience to our fundraising for Stanford Medicine. I will send an update when I have it; in the meantime, I want to thank each of you for your friendship and professional support.

I want to take this opportunity to thank Laurel Price Jones for her contributions and to wish her well in her personal and future life events.

I am pleased that Ms Barbara Clemons will serve as the Interim AVP – a role she has so ably filled in the past. During the next several weeks we will be working to further refine how to further optimize the future success of OMD and its conjoint work with the Offices of Hospital Development (at SHC), the Lucile Packard Foundation for Child Health and the Office of Development at Stanford University. Philanthropy and medical development are among the most essential underpinnings for our future success, and we will do all we can to make our programs as successful as we can.

Updating the Facts on Conflicts of Interest

Issues regarding interactions with industry and potential conflicts of interest continue to abound and require ongoing communication, refinement and understanding. These policies are updated as needed (see: <http://med.stanford.edu/coi/siip/policy.html>), and attention is given to addressing common questions. Recently Dr. Harry Greenberg, Senior Associate Dean for Research, and his colleagues put together a “fact sheet” along with some background references that I share below. I urge all faculty to give careful attention to this information, which will be posted in the near future at the website noted above.

**Q. How will I know if an industry sponsored talk I have been asked to give is promotional?
Does SIIP apply to me?**

There is no way to answer this question perfectly, and in the end, you must rely on your own good sense and judgment. Here are a series of questions to help you try to determine if the company is compensating you for a talk in a promotional capacity.

- Is compensation coming from the marketing division rather than the research division of the company?
- Is your compensation for giving the talk reasonable and customary?
- Is the company providing some/all of the content for the talk (slides, talking points, teaching aides, etc)?
- Is the company dictating the topic of the talk with any level of specificity?
- Does the company have any control over the topic/content talk? Do they review the talk contents prior to presentation?
- Is the company offering inducements to learners to attend the talk (e.g. meals, travel, gifts, lodging, honoraria, other)?
- Has the company asked you to attend a speakers training session?
- Is the venue for the talk more appropriate for a holiday or vacation than for a learning experience?
- The SIIP prohibition on engaging in educational activities that are promotional applies to all full time and part time faculty, including active emeriti, UTL, MCL, Clinician Educators, Adjunct faculty, staff, students and trainees
- When in doubt ask Barbara Flynn, Harry Greenberg, or your Department Chair.

Q. If I give a talk sponsored by industry that is allowable under SIIP what guidelines I should follow?

- Ensure that your financial support by industry is fully disclosed by the meeting sponsor
- Prominently disclose to the attendees that you are being paid by the company to give the talk
- Do not use the Stanford name in a non-Stanford event except to identify your title and affiliation
- Make sure you communicate to the audience that the content reflects your views and not the views of Stanford School of Medicine, Stanford Hospitals and Clinics or Lucile Packard Children's Hospital
- Provide a fair and balanced assessment of therapeutic, diagnostic or preventative options and promote educational material that is scientifically accurate

Q. How can some industry relationships derail education?

- Faculty who accept gifts from industry model this behavior for their students and trainees
- Pharmaceutical and device companies have a history of using educational talks by academic leaders to promote their products
- Industry support of many continuing medical education (CME) activities has been associated with programs that were geared toward promoting their products in order to encourage sales rather than advancing knowledge

- In order to counter-act the effect of industry support on CME the Stanford School of Medicine does not accept direct support for its CME programs. Greater emphasis will be on education that targets outcomes and quality improvement:
- takes advantage of emerging technologies
- focuses more on the professional and technical development and education of the learner
- based upon the best scientific evidence available
- designed to change physician competence, performance-in-practice and/or patient outcomes

Q. Do free meals really influence us?

- "Food is the most commonly used technique to derail the judgment aspect of decision-making." [Katz]
- Gifts of food influence attitudes, a fact that has been documented by Social Science research for decades
- Experimental subjects were more likely to accept persuasive messages when accompanied by food [Janis]

Q. When is a gift not a gift?

- Gifts become a social contract that creates a sense of obligation called reciprocity [Cialdini]
- Even di-minimus gifts, such as pens, engender a sense of obligation and reciprocity on the part of the recipient [Wazana]
- Feelings of obligation to reciprocate are unrelated to the value of the gift
- Reciprocal giving is often unequal—the return gift may have a higher value (e.g. a pen vs. writing a prescription with that pen) [Cialdini]
- Gifts that are unwanted or unsolicited still create the sense of obligation to reciprocate. [Cialdini]
- Gifts produce a feeling of obligation even when the giver is disliked [Regin]

Q. Why would I believe that a gift could influence me?

- 61% of physicians reported that gifts don't influence them, but only 16% thought they don't influence others [Dana]
- The size or value of the gift does not directly correlate with its influence
- Medical students were significantly more likely to think that gifts were more problematic for public officials than physicians [McKinney]
- Physicians that attended an industry-sponsored seminar including travel to a resort location, increased their usage of the sponsor's drug but deny the seminar had an influence [Orlowski]

Q. Is it allowable for our department to receive grants from industry for scholarships or other educational funds for students and trainees?

- Yes, as long as receipt is compliant with SIIP. Support must be specifically for the purpose of education and meet the following conditions:
 - The School of Medicine (SoM -- department, institute, program or division) selects the student or trainee
 - The recipient is not subject to any implicit or explicit expectation of providing something in return for the support, i.e., a "quid pro quo"
 - The funds are provided to SoM and not directly to student or trainee
 - SoM has determined that the funded conference or program has educational merit

Ethics and Society

Issues about ethics and society are ever more important. Indeed the most recent issue of *Stanford Medicine* (see: <http://stanmed.stanford.edu/2011spring/>) is focused on important issues and challenges in bioethics. I hope you will review this either on line or in print. In addition to the ethical dilemmas that arise within medicine, there are others that connect or arise from other fields but that have important messages for the medical community. The Center for Ethics and Society has sought to bring such issues to a wide audience and will do so on April 5th from 7-9 pm through a showing of the 2011 Oscar Award winning documentary film about the 2008 financial crisis, "Inside Job," in the Hewlett Teaching Center, Auditorium 200. This will be followed on April 6th by a panel discussion by Stanford faculty members from 4-6pm at the Bechtel Conference Center in Encina Hall (see: <http://ethicsinsociety.stanford.edu/ethics-events/events/view/1216/?date=2011-04-05>).

Awards and Honors

- Stanford has been the beneficiary of a number of Paul and Daisy Soros Fellowships for New Americans. Indeed 34 Stanford students have received this award since the program commenced. We have just learned that three additional students will be named as new Soros Fellows. They include:
 - **Aadel Chaudhuri** (MSTP student)
 - **Deepa Galaiya** (third-year MD student)
 - **Daniel Solis** (second-year MD student)
 Please join me in congratulating Aadel, Deepa and Daniel.
- **Dr. Preetha Basaviah**, Clinical Associate Professor and Director of the Practice of Medicine Course, is the recipient of the 2011 SGIM National Award for Scholarship in Medical Education. This will be awarded May 6th at the Medical Education Innovations Session of the SGIM Meeting in Phoenix, Arizona. Congratulations, Dr. Basaviah.

Appointments and Promotions

Eric Amesbury has been appointed to Clinical Assistant Professor (Affiliated) of Ophthalmology, effective 2/1/2011

Lindsey Atkinson Ralls has been promoted to Clinical Assistant Professor of Anesthesia, effective 7/1/2011

Denis Bouvier has been reappointed as Clinical Associate Professor of Medicine, effective 1/1/2011

George Commons has been promoted to Adjunct Clinical Associate Professor of Surgery, effective September 1, 2010

Kellen Glinder has been promoted to Adjunct Clinical Assistant Professor of Pediatrics, effective March 1, 2011

Shoshana Helman has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 3/1/2011

Joanne Imperial appointed to Clinical Associate Professor of Pediatrics, effective 4/1/2011

Yvonne L. Karanas has been promoted to Clinical Associate Professor (Affiliated) of Surgery, effective 3/1/2011

Beatrice Jenny Kiratli has been promoted to Clinical Associate Professor (Affiliated) of Orthopaedic Surgery, effective 4/1/2011

Kimberly L. Lee has been appointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 3/1/2011

Benjamin Mandac has been reinstated and reappointed as Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 9/1/2009

Song L. Nguyen has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2010

Erna Nishime has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 6/1/2011

Radhamangalam J. Ramamurthi has been promoted to Clinical Associate Professor of Anesthesia, effective 4/1/2011

Alejandrina Rincon has been appointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 7/1/2011

Tracy A. Rydel has been promoted to Clinical Assistant Professor of Medicine, effective 4/1/2011

Anita Sit has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2010

Lillian Soohoo has been promoted to Clinical Assistant Professor of Dermatology, effective 4/1/2011

Payam Tabrizi has been reappointed as Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 4/1/2011

Sandra A. Tsai has been promoted to Clinical Assistant Professor of Medicine, effective 3/1/2011

Leon Wanerman has been promoted to Adjunct Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective January 1, 2011

John H. Wehner has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2009

Brian P. Yochim has been appointed to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 5/1/2011

Dean's Newsletter

April 5, 2011

Integrated Planning: A Work in Progress With Serious Intent

It is good to know that in matters of institutional alignment we are ahead of the curve. Academic medical centers across the country are bracing for major changes and challenges that are almost certain to result from the consequences of the economic downturn on state and federal budgets. As you know all too well, the most immediate concern is the almost certain flattening – or

reduction – in NIH funding. Coupled with this are the changes unfolding in healthcare funding. These are related both to the Affordable Care Act and to decisions being made by employers and the private sector in response to the continuing rise in healthcare costs. As was evident at the April 2-4th meeting of the Council of Deans in Chicago, every medical school leader is focused on how the changing financial landscape will impact missions in education, research and patient care. While the themes are common, it is also important to underscore that there is enormous regional and local variation on how these events will likely play out based on whether the medical school is public or private, research intensive or more clinically oriented and, of course, on the status of local and state economies.

Perhaps the most important variable is the degree of alignment of the medical school with its teaching hospitals and parent university. This theme was expressed not only at the Council of Deans, but also at the joint meeting of the leaders of medical schools and teaching hospital CEOs that took place on April 4th. This meeting was not only timely but also notable in that it was the first joint meeting of the Council of Deans and the Council of Teaching Hospitals in well more than a decade. That alone is remarkable. What was interesting was how clearly aligned medical school and hospital leaders were in their recognition of both the major challenges and the close linkage between the success of the medical school and that of the teaching hospital and vice versa. So too was the recognition that the models developed in the past, in which clinical revenues cross-subsidize research and education and clinical revenues are bolstered by private payers to make up shortfalls in public payments (through Medicare and Medicaid), will need to change. How those changes are accomplished will define the future of academic medicine and the future health of our nation.

These are themes I have recounted frequently and, while we are not immune to coming economic challenges, we have done a great deal to prepare for their consequences. While no amount of preparation can provide a guarantee of security if the financial impact is too great or too rapid, I am confident that we are poised to make the necessary adaptations to assure our success. One reason for optimism is the integrated strategic planning we have been doing over the years. As you well know, we have been deeply involved within the medical school in the continued implementation of our strategic plan, *Translating Discoveries*, over nearly a decade. The School has also collaborated over the past several years with the Lucile Packard Children's Hospital (LPCH) in integrated planning that addresses our future efforts in clinical care as well as research and education. We have engaged in similar integrated planning with Stanford Hospital & Clinics over the years; these efforts have intensified during the past year and are now rapidly accelerating.

While it is important for the leadership of institutions to be aligned, it is equally imperative (perhaps even more so, given the complexities of academic medical centers) that alignment be recognized and embraced by all constituencies – faculty, students, staff, university leaders, members of the hospital boards of directors and trustees of the university. The current integrated planning efforts of the School of Medicine (SoM) and Stanford Hospital & Clinics (SHC) are occurring along different themes and agendas; they will be further developed and brought to our various communities and constituencies in the weeks and months ahead.

An important reality check on integrated strategic planning took place at a one-day retreat of the leadership groups of SHC (CEO and senior Vice Presidents) and SoM. Importantly, there was concurrence about what makes Stanford unique (especially its excellence in research and innovation) as well as what our vulnerabilities are. The latter relate to our size and scope of clinical activities in a marketplace that is rapidly consolidating and where the need to define our value to the communities we serve is more important than ever. As a next step we plan to have, over the next months, mission-based discussions with clinical chairs and then with other faculty and staff at SoM and SHC as well as with the governing boards of the hospital and university.

SoM and SHC are also in the midst of comprehensive integrated planning in key areas that intersect our missions in research, education and patient care. For example, a group of faculty and hospital leaders is working intensely to develop a roadmap for the future of Cardiovascular Health that builds on the work of the Cardiovascular Institute and interdepartmental programs in cardiology, cardiovascular surgery, vascular surgery and related services. Similar broad institutional and interdepartmental planning is also underway in Cancer and will soon be launched in Neurosciences and in Immunity/Transplantation/Infection. Each of these efforts is addressing our future success in innovation and discovery, excellence in medical care delivery, outstanding quality and patient service and the value that Stanford Medicine offers to our community.

Planning is also being initiated around related missions in primary care, other clinical services, network development and the alignment of the Medical Center with the University and the communities we serve. Increasingly our attention must be focused on the relative emphases we put on hospital, ambulatory and community-base care delivery – which will surely impact our faculty as well as our trainees. While these activities have a broad range, they are interconnected and, taken together, will help define the resources we will need in faculty recruitments, staffing and of course capital needs – especially the new Stanford Hospital. They will also allow us to identify the ways in which we will garner needed resources through programmatic investments, business plans and philanthropy.

The SoM, SHC and LPCH are also actively working on our response to the rapid changes in healthcare reform and financing. Our new Clinical Research Excellence Center will play an increasingly important role, but so too will our efforts and decisions regarding our University Health Alliance, our planning in Population Science and our ability to engage in risk management through new entities like “Accountable Care Organizations” and other changes that will emerge in the years ahead.

Of course, as I have discussed in recent Newsletters, we are also deeply involved in planning around our missions in education and research. These activities are also linked to those outlined above and serve to underscore the complexity, range and depth of our challenges and the opportunities they will afford. While it seems likely that much of what we do in the years and decades ahead will address critical questions of how and where we manage health and deliver care, we must also be laser focused on preserving and enhancing our efforts in innovation and discovery and in the training and development of future transformative leaders. There is no denying that this will be difficult – but the risks of failure are unacceptable if we are to steward the future of Stanford Medicine for the generations to come.

Best Practices Brings Medical Schools and Teaching Hospitals Together

If alignment at the institutional level is an imperative, the opportunity to bring our nation's academic medical centers into alignment is also compelling. With that in mind 105 medical schools and 109 teaching hospitals have signed on to the *Best Practices for Better Care* initiative coordinated by the Association of American Medical Colleges (AAMC) – see: <https://www.aamc.org/initiatives/bestpractices/>. Stanford will be one of the participating institutions.

This new initiative aligns medical schools and teaching hospitals through a common commitment to these five important goals:

- Teach the next generation of doctors about the importance of quality and patient safety through formal curricula
- Ensure safer surgery through use of surgical checklists
- Reduce infections from central lines using proven protocols
- Reduce hospital readmissions for high-risk patients
- Research, evaluate, and share new and improved practices.

Importantly, Stanford has already initiated efforts in each of these areas – and more. While our individual efforts are important in their own right, we are likely to learn from similar experiences of colleagues around the country and thus will be able to better serve our own patients. Importantly, this aligned effort will hopefully make a clear statement to the national community we serve about the value of academic medicine and our shared commitment to patient care, quality and safety as well as to ways to improve the delivery of care and manage its costs and outcomes. For more information about Best Practices for Better Care and a list of participating institutions, visit www.aamc.org/bestpractices.

Launching Accountable Care Organizations

The lexicon for healthcare delivery has changed over the years, with various intents and goals. From private practice to group and multispecialty practices, to health maintenance organizations, capitated or managed care, various approaches have been taken to care for patients individually or in populations. The latest rendition is the “Accountable Care Organization (ACO),” which was forecast in the Affordable Care Act as a way to manage populations, promote health, improve quality and safety outcomes and reduce costs. The first phase of the ACO is focused on payments from Medicare, and the “proposed rules” governing ACOs from the CMS (the Centers for Medicare and Medicaid Services) have been expected for many months. They were issued this past week and will open for comment through June 6th. They can be found at <http://oig.hhs.gov/fraud/aco.asp>. CMS has also released a number of fact sheets available at www.calhospital.org/aco-proposed-rule-released <<http://www.calhospital.org/aco-proposed-rule-released>>.

A Health Policy Forum article by Dr. Don Berwick, Director of CMS, in New England Journal of Medicine (see: <http://healthpolicyandreform.nejm.org/?p=14106&query=home>) offers a

readable summary of the rationale and goals for ACOs. That said, as I learned at the April 4th combined meeting of the Council of Deans and Council of Teaching Hospital leaders, the now published “proposed rules” for ACOs are nuanced and bureaucratic, and they require digestion, discussion and reaction. ACOs can be hospital based, physician organized or integrated between hospitals and physicians. We will need considerable discussion and debate about whether and when we should forge toward forming an ACO, but as we proceed it is clear that we would do so in an integrated hospital/physician model. I am sure there will be a lot more to say about ACOs but for now I wanted to alert you to the fact that they are becoming more of a reality – at least in words.

Clinical Practice Guidelines and Conflicts of Interest

During the past week two reports, one from the Institute of Medicine (IOM) and another in a leading medical journal, provide contrasting portraits of the integrity and transparency of clinical practice guidelines. On March 23rd the IOM issued “*Clinical Practice Guidelines We Can Trust*,” which recommends eight standards to ensure the objective and transparent development of trustworthy guidelines (see: <http://www.nas.edu/morenews/20110323.html>). Among the stated standards are:

1. Establishing transparency by explicitly stating and making publicly accessible the processes by which Clinical Practice Guidelines (CPGs) are developed and funded.
2. The management of conflict of interest whereby individuals considered for membership in the development of a CPG should declare all related conflicts of interest with the intent of making any conflicts known and transparent and excluding individuals with COI wherever possible. Specifically the chair of the CPG group should have no conflicts and funders should have no role in the development of the CPG.

Ironically, the March 28th issue of the Archives of Internal Medicine included a report by TR Mendelson et al entitled “*Conflicts of Interest in Cardiovascular Clinical Practice Guidelines*” (*Arch Intern Med.* 2011;171:577-585) that reports on the 17 most recent American College of Cardiology/American Heart Association Guidelines through 2008. The authors observed that 56% of the 498 individuals who worked on these CPGs reported a COI (ranging from 13%-87% on different CPGs). The authors concluded that conflicts of interest are prevalent in cardiology guidelines – although I would add that it is likely that similar observations would be found in CPGs for other diseases and disciplines. An “invited commentary” by Dr. Steven Nissen from The Cleveland Clinic was highly critical and raised serious concerns about the integrity of the clinical guidelines in cardiology and the potential bias they might convey. While there will surely be different points of view about this, the observations are not new and have been a source of concern for some time. Given the importance of evidence-based medicine and the likelihood that clinical practice guidelines will become even more prevalent and important in future healthcare, we need to be mindful of the past and potentially current state of CPG development. This makes the report from the IOM even more timely and important.

Avoiding Financial Conflict of Interest Learning Module for New Faculty

Dr. Ann Arvin, Vice Provost and Dean for Research, has informed us about a new training tutorial titled *Avoiding Financial Conflicts of Interest* that must be completed by all new

Stanford faculty. It is a self-paced, web-based module designed to provide an overview of the high-risk situations that can lead to financial conflicts of interest for faculty. Additional information about the module can be found at the COI website <http://www.stanford.edu/group/coi/training/training.html>. It is available to all members of the Stanford community with SUNet IDs through the Stanford Training and Registration System (STARS).

One and Ten Year(s)

During the past week we had the opportunity to celebrate the anniversary of the move of the Dean's Office into the Li Ka Shing Center for Learning and Knowledge. At that time we, along with the Simulation and Education Technology group (SET) were the first and only occupants of the LKSC – which was still undergoing completion. In many ways we were the beta test for this wonderful new facility – although when we moved in floors (literally) were still to be finished, the Café and the Paul and Millie Berg Conference Center still distant dreams, the Berg Family Commons a promissory note for medical and graduate students, and the Goodman Simulation Center mostly wires and architect's plans.

A year later, the LKSC is bustling with activities inside and out virtually 24/7. We had hoped that with the LKSC we would finally have a definable “front door” to the School of Medicine – and that dream has been more than fulfilled. Our medical and graduate students view it as a place for learning, meeting, exercising, communicating and relaxing. Our faculty and staff view the LKSC as a place for conveying and meeting. The Stanford community now sees the LKSC as a gathering place with lawns for sitting and having picnics and social events. And Discovery and Foundation Walks now serve as major thoroughfares within the medical school, to and from the Schools of Engineering and H&S and as a ready route to Stanford Hospital & Clinics and the Lucile Packard Children's Hospital.

A lot has happened in a year – and especially the past six months – and for this I thank the many faculty and staff who helped bring the LKSC to reality. And of course we are all deeply grateful to those who provided the funding for the LKSC – particularly Mr. Li Ka Shing, Professor Joseph and Hon Mai Goodman, Professor Paul and Millie Berg, Dr. CJ and Han Lip Huang, Dr. Keith Gianni, Serge Klotz, Jane Anne Nohl, Enid and Robert H. Parsons, Dr. Arthur J. Riesenfeld, Dr. Roy Stanford, and Akiko Yamazaki and Jerry Yang, along with significant contributions from our basic and clinical departments, the Dean's Office and the President's Fund at Stanford University. Because the LKSC was quite purposefully designed to optimize flexibility, it is also a facility that will continue to change and evolve in an organic and functional way in the years ahead. The LKSC will also help to connect and intersect with the new Stanford Hospital and the additions to the Lucile Packard Children's Hospital that will be constructed over the next several years. Clearly a lot of exciting and important changes – but for now it is wonderful to celebrate the memory of our first year (even if just in a limited way) of occupying the LKSC.

In tandem with the milestone of the LKSC and other major events I note in passing that I passed the ten year mark as Dean of the School of Medicine this past weekend – during which time I was chairing the annual meeting of the Council of Deans of the Association of American Medical Colleges. While I suspect that not everyone shares this feeling, it is amazing to me that

the years have passed so quickly since my very first Dean's Newsletter (DNL) on April 2, 2001. I hasten to add what a privilege it has been to work with so many extraordinary faculty, students and staff across this remarkable university and community. Of course, I realize that there is understandable speculation about how long the DNL's will continue to come to you on their regular bi-weekly schedule. I am still looking at the end of summer 2013, and while for some that may feel too short and for others too long, for all of us there is a lot to continue to do at this time of change and transformation in medicine and science.

Stanford and the March of Dimes

On Wednesday, March 30th we celebrated a new major collaboration between Stanford University and the March of Dimes designed to address one of the major challenges impacting child health in the United States – prematurity. Despite so many advances in pediatrics over the past decades, prematurity remains the leading cause of death in newborns in the US – occurring in one of eight babies. While the preterm birth rate has declined in recent years it is still nearly 30% higher than it was in the early 1980s, and it has major impacts on children, families and society.

Being born even just a few weeks preterm can be associated with an array of immediate and long term complications including respiratory distress and problems, the risk of neurological damage (and cerebral palsy) and a panoply of learning and developmental disorders. Immature organs associated with prematurity can have a number of short and long term consequences, and the risk for life-threatening infections is also increased during the neonatal period. Notably, all of these complications increase the earlier preterm birth occurs. In addition to the impact of prematurity on infants and their families, the financial costs to the nations are significant as well. In 2006 the Institute of Medicine estimated that prematurity costs the nation more than \$26 billion annually.

Major knowledge gaps in the causes of prematurity remain despite decades of research. This has led to a unique partnership between the March of Dimes and Stanford University to establish the March of Dimes Prematurity Research Center at the Stanford University School of Medicine. At the March 30th event, the leadership of the March of Dimes announced a \$20 million grant to Stanford to make this new center a reality. Led by Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs and the Harold K. Faber Professor of Pediatrics, who will serve as the Principal Investigator, the center will bring together experts from a variety of disciplines to develop new approaches to the study of prematurity with the goal of preventing its occurrence. Specifically, the new center has four goals:

- Understanding the factors that lead to preterm birth
- Predicting which women are at risk of delivering a preterm birth
- Translating the research findings into clinical interventions and policy changes that will prevent preterm delivery
- Reducing the social disparities that contribute to preterm birth

Additional details about this exciting center are presented in a recent report (see:

<http://med.stanford.edu/ism/2011/february/dimes-0228.html>). In addition to thanking the March of Dimes for their support, I want to acknowledge the leadership of Stanford faculty who will serve as co-principal investigators. They include Dr. Paul Wise, Professor of Pediatrics and of Health Research & Policy, and Dr. Gary Shaw, DrPH, Professor of Neonatology. As I noted in

my comments about the center, “This is the kind of research that Stanford faculty are uniquely qualified to carry out. The research is directed at generating and testing new hypotheses and investigational strategies through a highly innovative, collaborative, transdisciplinary structure that integrates and utilizes powerful new informatics capabilities with an unprecedented array of ethnically-diverse, biologic, clinical and environmental population-based datasets.”

Remembering Dr. Larry Crowley

I received news this past week that Dr. Larry Crowley died on March 28th following a long struggle with illness. Without question Larry Crowley was a major figure in the life of the Stanford Medical Center, where he had a significant and lasting impact on the medical school, Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital. He made major contributions to each and is credited as one of the driving forces that led to the building of the Lucile Packard Children’s Hospital. Because of his extraordinary work and contributions he was awarded the Dean’s Medal in 2009. I am copying below the tribute I prepared for him at that time – which is certainly applicable today and which speaks to Dr. Crowley’s past and future legacy.

Lawrence G. Crowley, MD, professor emeritus of surgery, is presented the Dean's Medal in recognition of his leadership contributions to Stanford University, the School of Medicine, and to the community as a whole.

Dr. Crowley was born in Newark, New Jersey in 1919, and received both his BA and MD from Yale University. He completed his residency in General Surgery at the Yale-New Haven Hospital, and had his first teaching position as an assistant professor of Surgery at Yale Medical School before moving on to spend ten years as a part-time assistant clinical professor of surgery at the University of Southern California School of Medicine (USC).

While at USC, Dr. Crowley managed to juggle his position at the university with a private practice in surgical oncology along with numerous community projects. His most notable community contribution was to Casa Colina, a former Polio rehabilitation facility. After polio was eradicated by the development of a vaccine by Jonas Salk in the early 1950s, Dr. Crowley worked with the board and persuaded them to broaden their services to care for patients of all ages with all kinds of physical injuries and disabilities.

Casa Colina has been recognized throughout the nation as the first to introduce many of the modalities that are implemented in rehabilitative care today, as well as the first rehab center to offer a complete range of care for those with brain injuries and other neurological trauma.

Dr. Crowley first came to Stanford as professor of surgery in 1964, and left to become dean of the University of Wisconsin School Of Medicine from 1974 to 1978. He returned to Stanford as acting dean of the medical school, and in 1979 was appointed vice president for medical affairs at Stanford. Of his many contributions to the medical center, his efforts as a champion of the new children's hospital are some of the most significant.

Dr. Crowley and Lucile Packard both felt that the time had come to replace the Stanford Convalescent Home with a more advanced facility for children's care, particularly since the types of diseases affecting children now required far more than rest and recuperation.

Dr. Crowley also argued strongly to attach the children's hospital to the existing Stanford University Hospital, rather than rebuilding on the original site of the convalescent home. During the last decade, the Lucile Packard Children's Hospital has grown to become one of the leading centers of excellence in pediatric medicine and surgery, and Dr. Crowley's foresight was instrumental in the success of this important partnership.

Dr. Crowley's other honors include the Certificate of Merit from the American Cancer Society and a Stanford University Distinguished Service Award, and the Lawrence Crowley, MD Endowed Professorship in Child Health was named in recognition of his contributions to Stanford.

Dr. Crowley is survived by his wife Madeline and his children, Larry Jr, Steve and Suzanne, grandchildren and legions of family, friends and colleagues. He will be deeply missed. A Memorial Service to celebrate his life will be planned, and I will let you know the details when they are available.

Upcoming Events

28th Annual Stanford Medical Student Research Symposium

Thursday, May 12

3:00 – 6:00 PM

Ballroom, Li Ka Shing Center for Learning and Knowledge (LKSC)

Faculty and students are invited to hear students present their posters and answer questions about their research. Approximately, 30-40 medical students, both MD and MD/PhD will showcase their original medical research projects carried out in laboratories, clinics and the community - locally and abroad. These projects from the medical student body demanded that students identify and research contemporary health issues that affect individuals and communities as a whole.

After closing remarks at 5:45 PM, the Stanford University Medical Center Alumni Association will announce the students with the outstanding research posters, capping the event.

For information about this event, please contact Beth Leman (leman@stanford.edu).

10th Annual Medicine and the Muse

Tuesday, April 12

5:00 PM

Paul and Millie Berg Hall, Li Ka Shing Center for Learning and Knowledge

Dr Audrey Shafer, Professor of Anesthesia, Stanford University School of Medicine/VA Staff Anesthesiologist, Veterans Affairs Palo Alto Health Care System and Director, Arts, Humanities and Medicine Program, Stanford Center for Biomedical Ethics <http://bioethics.stanford.edu/arts/>

asked me to let you know about the 10th Annual Medicine and the Muse Program, which will take place on Tuesday, April 12th. This year's program features art exhibits and presentations by Stanford medical students. Dr. Richard Kogan, a psychiatrist and concert pianist and artistic director of the Music and Medicine Initiative at the Weill Cornell Medical College, will give the keynote presentation.

Medicine and the Muse is free and open to the public, however seating is limited. For more information see: <http://bioethics.stanford.edu/arts/events/MedicineandtheMuse.html> or contact: 650.723.5760.

Save the Date: LPCH Is Having a 20th Birthday Party

Sunday, June 26th

10:00 AM – 4:00 PM

Intersection of Quarry and Welch Roads

On Sunday, June 26th the Lucile Packard Children's Hospital will be celebrating its 20th anniversary with a celebration of their history and future plans featuring more than 75 interactive booths, favorite hospital staff members, musical performances, storytelling, face painting, and more. Food from local favorites and cupcakes will be available. Everyone is invited!

Awards and Honors

- **Dr. Helen Blau**, the Donald E. and Delia B. Baxter Foundation Professor and Director, Baxter Laboratory for Stem Cell Biology, has been named the recipient of the AACR (American Association Cancer Research Foundation Irving Weinstein Lectureship. This lectureship was established to “acknowledge and individual whose outstanding innovations in science and whose position as a thought leader have the potential to inspire creative thinking and new directions in cancer research”
- **Dr. Karl Deisseroth**, Associate Professor of Bioengineering and of Psychiatry, has been named the first recipient of the Ludwig von Sallman Clinician-scientist Award, presented by the ARVO Foundation for Eye Research (AFER) to a clinician-scientist under age 40.

Appointments and Promotions

Barry R. Behr has been promoted to Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective March 1, 2011.

David F. Fiorentino has been promoted to Associate Professor of Dermatology and, by courtesy, of Medicine, at the Stanford University Medical Center, effective April 1, 2011.

Allan Mishra has been promoted to Adjunct Clinical Associate Professor of Orthopaedic Surgery, effective March 1, 2011.

Andrew J. Patterson has been reappointed to Associate Professor of Anesthesia and, by courtesy, of Surgery, at the Stanford University Medical Center, effective April 1, 2011.

Christopher K. Payne has been promoted to Professor of Urology and, by courtesy, of Obstetrics and Gynecology at the Stanford University Medical Center, effective March 1, 2011.

Homero Rivas has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective April 1, 2011.

Dean's Newsletter

April 18, 2011

Dr. Alan Garber Named Provost of Harvard University

On Friday, April 15th Harvard University President Drew Faust announced that Alan Garber has been appointed the next provost there. Dr. Garber is currently the Henry J. Kaiser Jr. Professor of Medicine and, by courtesy, of Economics; Professor of Health Research and Policy & Economics in the Graduate School of Business; and Senior Fellow at the Freeman Spogli Institute (FSI) for International Studies, and he is a much respected and beloved member of the Stanford community. While we always are disappointed to lose a valued colleague and distinguished faculty member, it is hard to not celebrate Alan's selection for this important new position – for which he is quite well suited.

Dr. Garber is a graduate of Harvard College, Class of 1976, and he received a PhD in economics from Harvard while he was completing his MD degree at Stanford. In 1986, following his internship and residency at the Brigham and Women's Hospital, he joined the Department of General Medicine at Stanford University. Over the past 25 years he has had a remarkably successful career that has intersected medicine, economics and health policy. He is deeply admired in the academic community for his broad medical knowledge, deep analytical thinking and ability to bridge broad intellectual disciplines and fields. He has also been a highly valued consultant and guide to health policy for political candidates and for the public and private sectors. His breadth and range of skills and knowledge make him exceptional and remarkably qualified to serve in the central role of provost of a major university. Harvard has been unique among leading universities in selecting outstanding MD leaders as provosts, including the two most recent incumbents, Harvey Feinberg, now President of the Institute of Medicine, and Steve Hyman, a renowned neuroscientist and psychiatrist.

Without question Alan Garber's departure for his new position in Cambridge on September 1st will leave a major gap in Stanford's excellence in medicine, economics and policy. At the same time he will bring his unique skills to another great university. Naturally we will seek Alan's guidance, along with others, to consider how to retain and shape the excellent programs he and his colleagues have established at Stanford. But for now please join me in congratulating Alan Garber and in wishing him well for an exciting new journey.

Healthcare in the US: Past, Present and Future

Dr. Rob Jackler, Edward C. and Amy H. Sewall Professor in Otorhinolaryngology and Chair of the Department of Otolaryngology, recently shared an interesting article from the New York Times on healthcare reform, which if you haven't seen you might find interesting. I thought you

might be interested in a few excerpts from this report, and I am taking the liberty of copying the first couple of paragraphs and conclusion for your perusal.

The results of America's first comprehensive survey of the economics of medical practice, made public last week by the committee on the costs of medical care after five years of study, reveal what may be described as a crisis in medical service.

They show that while the average pay of physicians and other health workers is not high and while the actual pay in individual cases is often insufficient, adequate medical attention is beyond the reach of many millions of people.

They reveal that while medical knowledge has been progressing rapidly for half a century or more, the application of that knowledge to the needs of the general public has lagged.

But when it comes to measures to meet the crisis there is disclosed a clash of philosophies, forcefully presented in the majority and minority reports of the committee. The majority group, expressing themselves in recommendations so sweeping as to come under the heading of revolutionary, see medicine as a social problem and responsibility, demanding reorganization and centralization. The minority see it as a function which can never be socialized, since in their opinion it must always resolve itself into a highly personal relation between physician and patient. There are already indications that the reports, in their radical divergence, will shake the medical world to its core.

The lengthy article, which was written by RL Duffus, ends with a last paragraph entitled "A Challenge Presented," and I quote:

"As the report puts it" Dr. Hamilton concludes, "the present situation presents a challenge. It is not a question of whether we can afford to pay for an adequate and comprehensive system of medical care. A social investment in health pays its own way and yields a surplus. The present system is a luxury which the American nation -- rich as it is in resources -- is too poor to afford"

That the report is, as Dr. Hamilton says, a "challenge" has already been established by its reception. It is the opening gun in a battle between individualism and socialism in medicine which promises to be of long duration.

The committee that was referred to above, and that led to this review, was chaired by Dr. Ray Lyman Wilbur and was financed by eight foundations. Dr. Wilbur was Dean of the Stanford University School of Medicine from 1911-1916 and then served as President of the University from 1916-1943 (during which time he was Secretary of the Interior from 1929-1933 [giving new meaning to multi-tasking]). *The New York Times* article referred to above was published on December 4, 1932.

Without overstating the case, it is remarkable to note the parallels of the debate on healthcare reform that still exist today, nearly 70 years later. It is worth remembering that when Roosevelt constructed the New Deal (of which Dr. Wilbur was a critic) he was advised to leave healthcare reform off the table in lieu of other major social initiatives, including Social Security. Had healthcare in the US been addressed then we might not be having the debates that are taking place today.

The current set of challenges in healthcare reform was the topic of the Second Medical Staff Symposium held on April 5th, at which a panel led by Dr. Rob Jackler addressed some of the implications of healthcare reform for Stanford. Also participating in the panel were Drs. Alan Garber, the Henry J. Kaiser Jr. Professor of Medicine and, by Courtesy, of Economics; Professor of Health Research and Policy & Economics

In the Graduate School of Business; and Senior Fellow at the Freeman Spogli Institute (FSI) for International Studies, and Dr. Arnie Milstein, Professor of Medicine and Director of the Clinical Excellence Research Center. Later in the week the Center for Health Policy at FSI and the Center for Primary Care and Outcomes Research in the Department of Medicine held events that focused on health policy issues in the US and globally. Similar discussions took place at the Board of Directors meeting of the Lucile Packard Children Hospital within the same week – underscoring the broad interest and implications of the healthcare debate.

And, of course, as these discussions have been taking place within our medical center, the debate in Washington has been filled with rhetoric and rancor, particularly over the past week – with polarizing commentaries on the Affordable Care Act of 2010, the economy and the major entitlement programs, especially Medicare and Medicaid. While Congressman Paul Ryan (R-WI) proposed the elimination of Medicare and Medicaid as part of 5-trillion deficit reduction package over the next decade, President Obama proposed preservation of these entitlement programs, albeit with reductions in their spending. He further proposed strengthening the Independent Payment Advisory Board (IPAB), which is slated to begin in 2014 and which is charged with serving as a check on Medicare spending by removing some of the decision making authority from Congress and making payments more evidence-based.

Given the current and projected costs of healthcare it seems undeniable that we cannot afford to continue the discussion of 1932 another 70 years into the future. However, the debate does not seem destined for resolution in the immediate future.

NIH and Federal Research Budget for the Remainder of FY11

I am taking the liberty of copying a recent update from David Moore of the AAMC (see: <https://www.aamc.org/advocacy/washhigh/>) since he nicely summarizes the impact of the recent federal legislative battle and resolution on NIH funding and other federal programs we in the AAMC rely on. It is worth underscoring that these results affect spending through the end of September 2011. The battle over the FY12 budget (which would begin on October 1, 2011 – unless there is another continuing resolution) is just getting underway and promises to be equally if not even more fierce and contentious.

The final bill includes \$30.7 billion for the **National Institutes of Health (NIH)**, a \$320 million (1.0 percent) reduction from FY 2010, including the 0.2 percent across-the-board cut. The bill specifies \$210 million in cuts from a pro rata reduction of all institute, center, and the Office of the Director's budgets, and \$50 million from the intramural buildings and facilities account. The bill does not provide funding for the Cures Acceleration Network and does not include the statutory mandates governing NIH grant numbers and size that were included in H.R. 1 as passed by the House Feb. 19 [see *Washington Highlights*, Feb. 25].

H.R. 1473 specifies \$372 million for the **Agency for Healthcare Research and Quality (AHRQ)**, a \$25 million (6.3 percent) cut below FY 2010 levels. AHRQ is not subject to the 0.2 percent across-the-board cut because it is funded through a tap on all Public Health Service agencies rather than a direct appropriation.

The measure cuts funding for the **Health Resources and Services Administration (HRSA)** to \$6.261 billion, a \$1.2 billion (16.3 percent) cut below FY 2010. The HRSA administrator is tasked with developing an FY 2011 spending plan within 30 days of enactment to determine which programs within the agency will absorb much of the \$1.2 billion reduction. Shortly after H.R. 1473 was released, the House Appropriations Committee posted an accompanying table of suggested program cuts that proposes a \$164 million cut to the Bureau of Health Professions, the arm of HRSA that administers the Title VII, Title VIII, and Children's Hospitals Graduate Medical Education (CHGME) programs. Because the table only reflects the committee's assumption for how HRSA will implement the larger cut, final funding levels for the health professions, nursing, and CHGME programs will not be available until the agency submits its spending plan.

H.R. 1473 rescinds \$1.2 billion (2.5 percent) from the **Department of Veterans Affairs (VA)** medical care accounts in FY 2011 and reallocates it for FY 2012 advanced funding. The bill provides \$52.8 billion for the VA medical care accounts in FY 2012, a \$5.8 billion (12.4 percent) increase over FY 2011 including the reallocation.

For FY 2011, the **National Science Foundation** is funded at \$6.806 billion, a \$65.75 million (1.0 percent) decrease from FY 2010-enacted levels. H.R. 1473 provides \$5.510 billion for NSF research and related activities, \$53.13 million (0.8 percent) below FY 2010.

For the **Centers for Disease Control and Prevention (CDC)**, H.R. 1473 includes \$5.649 billion, a \$748 million (11.7 percent) decrease from FY 2010 levels and CDC's lowest funding level since 2003.

With implementation of new food safety modernization legislation on the horizon, **the Food and Drug Administration** received one of the few funding increases seen in H.R. 1473, with funding increased to \$2.447 billion, a \$102 million (4.5 percent) over FY 2010.

H.R. 1473 does not include the legislative riders to defund the **Affordable Care Act (ACA, P.L. 111-148 and P.L. 111-152)**; prohibit funding to Planned Parenthood; stop the Education Department from implementing "gainful employment" regulations of proprietary colleges; and prohibit the use of federal funds for needle exchange programs that were included in H.R. 1.

As part of the final compromise on FY 2011 spending, the House and Senate agreed to vote on two enrollment resolutions on cutting abortion and health care spending. The House adopted a resolution (H. Con. Res. 36) that would block federal funding of Planned Parenthood. The House also adopted a second resolution (H. Con. Res. 35) that would block funding to implement the ACA. However, both measures failed to reach the agreed upon 60-vote threshold for passage in the Senate, sending the spending package to the president without the policy provisions.

H.R. 1473 also requires the Government Accountability Office (GAO) to report to Congress within 60 days of the bill's enactment on "an audit of expenditures made for comparative effectiveness research through funds provided to the Agency for Healthcare Research and Quality, the National Institutes of Health, or any other agency within the Department of Health and Human Services" under the American Recovery and Reinvestment Act of 2009 (P.L. 111-5)

or the ACA. The report is to include a description of the expenditures made, the entities that received the funding, and the purpose of the funding.

The bill also includes a provision eliminating a requirement that the Secretary of Health and Human Services designate annual funding for each HHS agency's office of minority health. No funding is provided for the National Health Care Workforce Commission, the independent federal advisory body appointed by GAO in September 2010 [see *Washington Highlights*, Oct. 1, 2010].

To paraphrase Winston Churchill, it is not clear whether this is the end of the beginning or the beginning of the end – but no matter which it is, there are challenging times ahead for all of us, especially in academic medical centers.

Physicians and the Patient Experience

In previous Newsletters the importance of addressing and improving the patient experience has been coupled with excellence in innovation, outstanding medical care, and quality and safety as a means of assuring the value we provide to patients and the community we serve (se:

http://deansnewsletter.stanford.edu/archive/01_24_11.html#3,

http://deansnewsletter.stanford.edu/archive/09_13_10.html#4, and

http://deansnewsletter.stanford.edu/archive/12_01_08.html). While there is no doubt that we are blessed to have faculty physicians who provide state-of-the-art and cutting edge medical care and procedures, it is also true that patients assess their experience in a hospital and medical center not only on their encounter with their physician but on the whole experience they have during the visit or stay. This includes everything from the quality of the parking and food services to the cleanliness and service of the facility. Their assessment includes how much time the physician spent with them and whether they felt listened to and cared for with humanism and professionalism. Obviously the patient experience is a complex interdigitation of services and functions provided by a wide range of medical center personnel and services.

While what we do as physicians is just a part of that patient experience, it is an important part – and in many ways it outweighs other components in the mind of the patient. Importantly, it is something we all seek to do well – although we may take it for granted or just assume we are doing it well. Further, the ability of any single physician to provide outstanding service is also affected by the extraordinary array of pressures each of us feels in our daily lives as doctors in a medical center caring for complex patients: the press and often multiple and simultaneous calls on our time, the demands of different masters (from academic to clinical and beyond), the fact that none of us work in isolation and that many of the services that define our performance can be the responsibility of others. All that said, there are a number of key roles we play as physicians, and these need to be considered both individually and as a members of a medical care team. An important question is whether there are ways to measure or monitor our performance and, if so, how such information might be shared in a way that is helpful and not accusatory or recriminatory. As with so many issues, we all make assumptions about our individual behavior and performance – but nearly all of us benefit from evaluating our performance in a comparative context that is data driven and transparent.

Based on these issues and concerns, this April the School of Medicine and Stanford Hospital & Clinics (SHC) are beginning a new project to distribute and share patient satisfaction data with faculty physicians. Patient satisfaction data can be collected in a variety of ways, none of them perfect by any means. At SHC they are collected by Press Ganey metrics – a commercial entity that collects similar data from several thousand US hospitals. SHC sends out approximately 100,000 such Press Ganey surveys each year with a response rate of about 25%. While data are available on inpatient as well as outpatient services, the ability to tie the information to individual physicians is more evident in ambulatory settings. These data are available for most but not all outpatient departments (e.g., they are not currently available for radiology, pathology, pediatrics and psychiatry).

While a lot of data is collected, the decision has been made to limit reports to just a few scores – particularly those linked most closely with overall patient satisfaction. They include responses to questions like these: the patient's likelihood of recommending the physician they encountered; the concern the physician showed for the patient's questions or worries; how well the physician included the patient in decisions about his/her treatment; the value of the instructions the care provider gave the patient about follow-up care; and the amount of time the care provider spends with her/his patient. These (along with other questions) are rated on a 5-point Likert scale ranging from "very poor" to "very good" (the top score). In the ambulatory score the results track to the "care provider," which is defined as the physician, nurse practitioner or physician's assistant who treated the patient.

Comparison with national data shows that top-quartile institutions have "top-box" (leading indicator questions) scores of 85% in the questions noted above. Hence, for the purpose of SHC reporting, if scores in individual questions are 85% or higher they will be coded green whereas if they are less than 50% they will be coded red. To help each of us understand how we are doing on these five "top-box" questions, we will each receive reports of our own individual scores (coded green to red) around April 15th and then quarterly thereafter. It is of course recognized that some of the patient sample sizes will be small, especially if the number of patient encounters are limited. Attempts will be made to increase the sample size in the future – but clearly scores with small sample sizes should be interpreted with caution.

The primary purpose of sharing these data is to improve the patient experience and our work as care providers. The underlying principles for improving the patient experience include compassion and caring, professionalism and pride, teamwork and communication. They are built on a foundation of outstanding state-of-the-art and cutting-edge medical care that is delivered with high quality and safety. Each of these factors is important and, while each requires discrete attention, they are all important in order to maximize our excellence as a leading medical center. To help with this initiative, a number of on-line as well as information and discussion sessions will be held in the weeks ahead. This project will also be part of a larger initiative that will engage every employee at SHC and that we hope will enhance the quality and excellence of our services to patients and community.

Social Networking and the School of Medicine: 2.0 to 3.0 and Beyond

At the April 15th Executive Committee meeting, Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, and Michael Halaas, Chief Technology Officer,

provided an interesting and informative update on the latest enhancements of the school's online Community Academic Profiles (CAP) system and a fascinating glimpse into further developments that are underway. The key to these is the marriage, as Dr. Lowe expressed it, of the CAP platform with social networking. Accomplishing this will open up entire new capabilities for communication and collaboration among all members of our community. It also bridges intergenerational thinking, comfort and utilization with information technology and especially the rapidly changing world of social networking – which is much more commonly used in age groups more akin to our students and junior faculty – although there is clearly overlap in both directions!

Dr. Lowe pointed out that social networking has been perhaps the most transformative of all the IT-enabled tools. For instance, there are currently 600 million Facebook users (250M added in 2010), 190 million Twitter users (100M added in 2010), and in 2010 there were 25 billion tweets. In fact, social networking overtook email in 2009. 83% of Fortune 500 companies use at least one form of social media. And, although we may have the impression that younger people are the primary users of social media, the average social network user is 37 years old (although I must say that in my book that still counts as “young!”). Social networking is clearly the new communication and collaboration platform. Given this, it is crucial that we take advantage of its capabilities in the context of our values, policies and goals. If we do not, we will find that members of our community will go elsewhere to use social media, with potentially negative consequences for such sensitive and regulated information as patient data.

The current version of CAP, version 2.0, was released in June 2010. It includes all School of Medicine faculty and students and all postdoctoral scholars at the University. It has a secure Stanford-only interface as well as a publicly assessable interface, mentoring functions, and a section where research opportunities can be posted. Currently, 75% of faculty, 69% of postdocs and 65% of students have profiles, for a total of 4337 profiles. I suspect that many of us are still not actively using this resource to its full potential.

The 2.0 version also has an enhanced capability for connecting faculty, students and trainees based on common research areas. It uses a vector space algorithm to calculate “similarity” scores between CAP profiles based on Shared MeSH publication topics in PubMed. It displays the top ten similar CAP profiles and can be used to explore CAP using publication topics as one of many potential linkages. This feature is updated daily based on CAP PubMed citations.

While CAP 2.0 added many new features to the initial CAP, the pace of technology advance is so rapid that IRT has been working on yet the next version for many months. The first phase of version 3.0, which IRT is calling *Collaboration Community*, is scheduled for release in the summer of 2011. It will include new profiles for staff, bringing the total potential number of profiles to roughly 10,000. In addition, there will be Twitter-style activity feeds, the ability to follow individuals and comment on the posts of others, and share documents and URLs, among other features. The second phase of this release, scheduled for the fall of 2011, will include the capability to form groups with privacy settings and increased search capability, as well as ongoing enhancements based on community feedback.

The potential uses for these exciting new capabilities include:

- Research proposal collaboration
- Educational and mentoring collaborations
- Medical student collaboration on clinical care teams
- Intra- and inter-departmental staff collaboration
- Expertise finding
- Formation of affinity groups for information sharing
- School-wide messaging (e.g. announcements, policies etc)
- Departmental communications

However, Michael Halaas also pointed out issues to watch and assess, such as:

- HR, policy and cultural issues
- The need for a critical mass of adoption
- Demographic differences in usage
- Community-driven behavioral norms

It is clear that ongoing assessment and fine-tuning will be required as our community begins to use these new tools, which although they pose some challenges, have the potential to transform once again our ability to communicate and collaborate. Thanks to Dr. Lowe and Michael Halaas for their intriguing look into a future that is, in some ways, already here.

Innovation, Intellectual Property and Patents

Innovation and discovery are major themes being promoted by the Obama administration, and they are clearly pursuits we carry out with great success at Stanford. The Bayh-Dole Act of 1980 gives universities, small businesses and non-profits intellectual property (IP) control of their inventions and other IP that result from federal funding (e.g., from NIH). This has revolutionized the role of universities in moving discoveries and innovations from academia to industry – benefitting the government’s investment in research and rewarding the faculty and university for new innovations. It also helps to promote economic development and has helped spawn local as well as national businesses with significant economic development.

One of the important steps toward commercialization of university discoveries takes place through the Office of Technology and Licensing (OTL), which is best of class at Stanford. A key part of this is seeking and acquiring a patent for a new discovery – which is an important protection of IP and a key step for garnering funding for product development. One of the challenges has been the timeline for patent review and approval. Because this process is critical to promoting innovation and helping to fulfill the objectives of the Administration in accelerating economic recovery through science, Stanford was fortunate to host a workshop done collaboratively with the United States Patent and Trademark Office.

Dr. Paul Yock, Director of the BioDesign Program and Martha Meier Weiland Professor of Bioengineering and Medicine, hosted a special panel discussion that featured David Kappos, Undersecretary of Commerce for Intellectual Property and Director of the United States Patent and Trademark Office (USPTO). Mr. Kappos delineated some of the challenges he has faced since he assumed his position in 2009 (e.g., the USPTO has over 700,000 patent filings waiting decision, a process that can take 5 or more years). Importantly, he announced a number of

initiatives he has put in place to streamline the work of the USPTO, to make submissions and reviews more automated and efficient, and be more responsive to the engine of innovation.

Most importantly, Mr. Kappos and the staff of the USPTO who participated in the various workshops on April 13th sought to listen to members of academia and the Silicon Valley community about ways the USPTO could work more effectively and collaboratively. Where clearly much work and many obstacles remain, the fact that the USPTO is willing to reach out to constituents and to be more responsive to their concerns is an important step. In addition to thanking Dr. Yock, special thanks for arranging this important dialogue also go to Kathy Ku, Director of the Office of Technology and Licensing, and Dr. Ann Arvin, Vice Provost and Dean for Research at Stanford and Lucile Salter Packard Professor of Pediatrics.

A New Chapter in COI Inquiries?

The Association of American Medical Colleges (AAMC) held its Forum on Conflict of Interest in Academe (FOCI) Meeting in Philadelphia on April 10-12th. Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs and Berthold and Belle N. Guggenheimer Professor of Medicine, and I participated in different panel discussions at the meeting. Also in attendance from Stanford were Barbara Flynn, Manager of the COI Program, Shannon Shankle, COI Analyst, and Dr. Harry Greenberg, Senior Associate Dean for Research and the Joseph D. Grant Professor of Medicine and of Microbiology and Immunology, who is also a member of the FOCI Academe Steering Committee.

The agenda was wide ranging and included COI at the institutional level, in clinical practice and education and in relation to the NIH, industry (including start-ups) and devices, as well as purchasing. One of the more startling comments came from Gardiner Harris, Public Health Reporter for *The New York Times*, during the panel I participated in. Specifically, Mr. Harris noted that from his perspective a bigger issue than COI with industry will soon be in the public eye.. It has to do with physicians and Medicare expenditures around clinical practice conflicts. While he didn't reveal the specifics, he did indicate that *The Wall Street Journal* is in possession of considerable data and that reports will be forthcoming. If true this would be concerning – especially in light of the long saga of conflict revelations during recent years, coupled with the scrutiny that Medicare is now under. Clearly not a comforting situation – but one we will learn more about as details come to light.

Frontiers in Human Health

On April 6th we hosted another in our series of Frontiers in Human Health, this one focused on “Translating Medical Discoveries.” Over 350 members of our community attended the event in the Li Ka Shing Center for Learning and Knowledge for dinner, discussions, presentations and more discussion. One of the features of the Frontiers events is the opportunity for guests to join a discussion with one or more faculty members who are seated at each table of ten. This is a great opportunity for dialogue and discussion as well as introducing the community to our Stanford Medical School faculty.

Dinner and table discussions were then followed by three presentations. One from Dr. Jim Ford, Associate Professor of Medicine (Oncology), Genetics and, by courtesy, Pediatrics, focused on how his team developed a novel new therapy (PARP inhibitors) now under study for women with so called “triple negative” breast cancer. It is based on his laboratory research and the opportunity to translate discoveries made there to patients. Dr. Kari Nadeau, Assistant Professor of Pediatrics (Immunology and Allergy) and, by courtesy, Otolaryngology, addressed the work she and her colleagues are doing on asthma and on the important but under-researched area of severe food allergies. Finally, Dr. Bill Robinson, Associate Professor of Medicine (Immunology and Rheumatology), addressed the common problem of osteoarthritis and how new approaches to intervention might be developed that would be based on a better understanding of the basic mechanisms responsible for this all too common impairment that occurs with aging.

Following the presentations, Paul Costello, Executive Director of the Office of Communication and Public Affairs, led a roundtable question and answer discussion – first with the presenters and then with the audience. This facilitated a lively and engaging dialogue.

Overall this was a terrific event and, in addition to the speakers and all the faculty who took the time to attend the event and participate in discussions, I also want to thank our outstanding Medical Development staff for all that they did to make this so successful. In particular I want to thank Caitlin Davis, June Lang, Jon Pierucci, Erik Rausch, Michele Shiele, Deb Stinchfield and Terri Tarantino.

Stanford School of Medicine Admit Weekend

On April 7-9th Stanford students, faculty and the Office of Admissions hosted a weekend of information and events for nearly 100 students who have been admitted to Stanford School of Medicine and who elected to return for another visit. According to Dr. Gabe Garcia, Director and Associate Dean for MD Admissions and Professor of Medicine, this was the largest group of returning students for “Admit Weekend” he could remember. This certainly suggests that a large number of our accepted students are interested in attending Stanford. During their weekend the Admit Students had an opportunity to learn more about the curriculum and the full range of services and activities at the medical school, medical center and university. Every effort was made to have lots of interactions with current students – including attendance at the School of Medicine Talent Show!

To date, the admitted students consist of 52% women, 48% men and 20% from groups underrepresented in medicine. However, since the students don't have to give us a final answer about whether they are coming to Stanford until May 15th, this is just a snapshot. The full portrait will not be known until we have the final acceptances and final numbers in mid-July.

Stanford Alumni Weekend

Exactly one week after “Admit Weekend” the Stanford University Medical Center Alumni Center (SUMCC) hosted its Annual Weekend led by Drs. Bill Rhine, MD’84, SUMCC President, and Linda Clever, MD’65, Associate Dean for Alumni Affairs. More than 350 Medical School alumni returned to Stanford for the weekend’s events and festivities – including

two graduates from the Class of 1946. Alumni took part in seminars, discussion groups, and tours and shared meals and social events with classmates and colleagues.

A highlight of the weekend was the “Stanford at the Leading Edge” symposium on Saturday morning, April 16th, which focused on Translating Discoveries: Brain, Body and Soul. It included a plenary session by Dr. David Spiegel, Director, Center on Stress and Health, and Medical Director of the Stanford Center for Integrative Medicine. Dr. Spiegel is also the Associate Chair of the Department of Psychiatry and Behavioral Sciences and the Jack, Lulu and Sam Willson Professor in the School of Medicine. Following Dr. Spiegel’s presentation, alumni had the opportunity to attend two seminars, choosing from the following outstanding speakers:

- **Dr. John Adler**, Co-Director, Stanford CyberKnife Center and Vice Chair of the Department of Neurosurgery and the Dorothy and Thye King Chan Professor
- **Dr. Helen Blau**, Director, Baxter Laboratory for Stem Cell Biology and the Donald and Delia B Baxter Foundation Professor
- **Dr. Sean Mackey** (Resident in Anesthesia’98 and Fellow in Pain Management’98), Chief of the Division of Pain Management, Director of the Stanford Systems Neuroscience and Pain Lab and Associate Professor of Anesthesia
- **Dr. James Doty**, Director of the Center for Compassion and Altruism Research and Education, Stanford Institute for Neuro-Innovation & Translational Neurosciences and Clinical Professor, Department of Neurosurgery
- **Dr. Tom Schall’88**, President and CEO, ChemoCentryx
- **Dr. Saki Srivastava**, Chief, Division of Clinical Anatomy, and Associate Professor, Department of Surgery
- **Dr. Gary Steinberg**, PhD’79, MD’80, Resident in Neurosurgery’83, Director, Stanford Institute for Neuro-Innovation & Translational Neurosciences, Co-Director, Stanford Stroke Center, Chair, Department of Neurosurgery and the Bernard and Ronni Lacroute-William Randolph Hearst Professor, Department of Neurosurgery.

Special thanks to each of the faculty members who made presentations to the alumni – which I heard from many were very well received. I want to offer my particular thanks to the Class Representatives for their work on the Alumni Weekend and to the many members of the Office of Medical Development who worked so diligently to make the weekend successful. Among others I want to thank Patrick Delahunt, Barbara Clemons, Bruce Bingham, Jon Pierucci and Terri Terrantino (and her group) from Medical Development and once again, Drs. Rhine and Clever. Our alumni are among our most treasured groups and I am confident that events such as this recent Alumni Reunion Weekend help affirm that reality.

Upcoming Events

28th Annual Stanford Medical Student Research Symposium

Thursday, May 12 | 3:00 -- 6:00 PM

Ballroom, Li Ka Shing Center for Learning and Knowledge (LKSC)

Faculty and students are invited to hear students present their posters and answer questions about their research. Approximately, 30-40 medical students, both MD and MD/PhD will showcase

their original medical research projects carried out in laboratories, clinics and the community - locally and abroad. These projects from the medical student body demanded that students identify and research contemporary health issues that affect individuals and communities as a whole. After closing remarks at 5:45 PM, the Stanford University Medical Center Alumni Association will announce the students with the outstanding research posters, capping the event. For information about this event, please contact Beth Leman (leman@stanford.edu).

Awards and Honors

- **Dr. Steve Galli**, The Mary Hewitt Loveless, M.D. Professor and Chair of the Department of Pathology has been named the recipient of the 2011 Scientific Achievement Award from the World Allergy Organization (WAO). The WAO is an international umbrella organization comprised of 84 regional and national allergy and clinical immunology societies from around the world.
- **Dr. Marilyn Winkleby**, Professor of Medicine at the Stanford Prevention Research Center in the Department of Medicine, received the inaugural Dr. Augustus A. White III and Family Faculty Professionalism Award, which was celebrated at a lovely event on Friday, April 15th in the Faculty Club. This award resulted from a generous gift from Dr. Gus White to foster and celebrate diversity and professionalism at Stanford. Dr. White also celebrated his 50th anniversary of his graduation from Stanford Medical School. He was the first African American graduate of Stanford and has had an incredibly illustrious career with major leadership roles at Harvard Medical School and nationally. His new book, *Seeing Patients: Unconscious Bias in Health Care*, describes his journey through medicine and helps understand the power of commitment and leadership in the face of adversity.

Dr. Winkleby is a most deserving first recipient of the Gus White Faculty Professionalism Award. Her research has focused on understanding the disparities that affect the health of ethnic minority and low-income populations. Dr. Winkleby is the Director of the Office of Community Health, which has had a major impact on the school and community since it was founded. She is also the co-founder of the Stanford Medical Youth Science Program (SMYSP), a 5-week summer residential program for low-income and under-represented minority high school students who are interested in pursuing careers in medicine or science. This program has been an incredible success since it began 24 years ago. Indeed, 100% of the 524 students who have completed the SMYSP have graduated from high school, 86% have graduated from a four-year college (of which 43% have attended medical school or graduate school) and 42% are becoming or have become health professionals. This is an extraordinary accomplishment and is worth celebrating in its own right – and now even more so with the Gus White III Professionalism Award.

- **Dr. Steven Quake**, Lee Otterson Professor in the School of Engineering and Professor of Applied Physics and, by courtesy, of Physics, learned of two significant awards within two days. First, Dr. Quake will receive the 2011 Promega Biotechnology Research Award from the American Society of Microbiology and the American Academy of

Microbiology. In addition, Dr. Quake will also be the recipient of the Raymond and Beverly Sackler International Prize in Biophysics - a prize which rewards outstanding scientists of 45 years or younger. This year's award focuses on "Innovative Physical Techniques in Biology."

Please join me in congratulating Drs. Galli, Winkleby and Quake for their well deserved recognition and awards.

Appointments and Promotions

Bruce L. Daniel has been promoted to Professor of Radiology, effective 5/01/ 2011.

David F. Fiorentino has been promoted to Associate Professor of Dermatology and, by courtesy, of Medicine, at the Stanford University Medical Center, effective 4/01/ 2011.

Andrew J. Patterson has been reappointed to Associate Professor of Anesthesia and, by courtesy, of Surgery, at the Stanford University Medical Center, effective 4/01/ 2011.

Homero Rivas has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center effective 4/01/ 2011.

Dean's Newsletter May 9, 2011

Dr. Sam Gambhir is Appointed Chair of the Department of Radiology

I am very pleased to announce that Dr. Sam Gambhir has agreed to serve as the next chair of the Department of Radiology. Dr Gambhir will succeed Dr. Gary Glazer, who has served with great distinction since 1987 and who created one of the most outstanding academic radiology departments in the world. Among Dr. Glazer's many accomplishments was the recruitment of Dr. Gambhir to Stanford in 2003 to serve as Director of the then newly created Molecular Imaging Program at Stanford (MIPS) as well as Chief of the Division of Nuclear Medicine in the Department of Radiology.

Dr. Gambhir graduated from the Medical Scientist Training Program at UCLA, where he obtained his PhD in Biomathematics and MD in 1993. He trained in Nuclear Medicine at UCLA and is a Diplomate of the American Board of Nuclear Medicine. To call Sam Gambhir's subsequent career trajectory anything but meteoric would be a major understatement. At UCLA he quickly rose from trainee to being Director of the Crump Institute for Molecular Imaging, Vice Chair of the Department of Molecular and Medical Pharmacology and Professor of Molecular and Medical Pharmacology. Since joining Stanford in 2003, Dr. Gambhir has developed a leading program in molecular imaging that developed unique collaborations and interactions across Stanford and the nation. He also designed and opened the new Nuclear

Medicine & Molecular Imaging Clinic in late 2010 that brings state-of-art clinical care to adult and pediatric patients.

Dr. Gambhir's honors and awards for his work are exceptional and include the Taplin Award (2002), Holst Medal (2003), AMI Distinguished Basic Scientist of the Year Award (2003), Doris Duke Distinguished Clinical Scientist Award (2004), Hounsfield Medal from Imperial College London (2006), Election to the Institute of Medicine of the National Academy of Sciences (2008), Tesla Medal (2008), and an RSNA Outstanding Researcher Award (2009). Since 2004, he has also served on the NCI Scientific Advisory Board. He has over 400 publications, has edited several leading textbooks in the field, has 30 patents granted or pending, and has received over \$75 million in NIH funding as a principal investigator. He also continues to actively engage the local community, and he raised significant funds to open the Canary Center at Stanford for Cancer Early Detection in 2009.

Dr. Gambhir is internationally recognized for his incredible scientific contributions and for training and educating the new generation of physicians and scientists focusing on molecular imaging. In gathering information about Dr. Gambhir for his appointment, I heard from virtually everyone I contacted that he is an individual of enormous talent and vision who will almost certainly reshape the future of imaging from both a scientific and a clinical perspective. His leadership skills are equally notable. While there is also no doubt that the field of radiology and imaging will change dramatically in the years ahead, Stanford is clearly fortunate to have Dr. Gambhir carrying on the tradition of excellence in radiology and imaging science already established at Stanford.

I also want to thank Dr. Bobby Robbins, Thelma and Henry Doelger Professor of Cardiac Surgery II, Chair of the Department of Cardiothoracic Surgery and Director of the Cardiovascular Institute, for his exceptional commitment and leadership as chair of the Search Committee. The Committee worked diligently for over a year to bring forth an incredible slate of candidates and finalists, and we all owe them a debt of appreciation and gratitude. This distinguished Committee included Drs. Ranjana Advani, Owen Aurelio, James Brooks, Robert Dodd, Sarah Donaldson, Sabine Girod, Sherril Green, Mike Longaker, Neyssa Marina, Ruth O'Hara, Jay Pasricha, Natalie Rasgon, Stephen Smith, Kevin Tabb, and Alan Yeung. I also want to thank Ms Kendra Baldwin for her exceptional role in staffing and coordinating the work of the Committee and the search process. She did this wonderfully well, and she won the respect of the candidates as well as the committee.

I also want to acknowledge the close collaboration we have had with the Stanford University Medical Center in bringing Sam Gambhir's appointment to completion. In particular I want to thank Amir Rubin, President and CEO of Stanford Hospital & Clinics, Chris Dawes, President and CEO of the Lucile Packard Children's Hospital, and Dr. Larry Leung, Chief of Staff at the VA Palo Alto Health Care System. I also want to thank Marcia Cohen, Senior Associate Dean for Finance and Administration, for her exceptional work in helping to bring the many threads of the recruitment to successful alignment.

Please join me in thanking Dr. Gary Glazer for his decades of service and leadership to radiology and to Stanford and join me in welcoming Dr. Gambhir as the next Chair of the Department of Radiology at Stanford.

Remembering and Celebrating the Life of Dr. Emma Bakes

When Emma Bakes entered Stanford School of Medicine in 2005 she envisioned learning medicine as a student and then, as a physician, caring for and learning from those whom she served. She could not have known that her deepest knowledge of medicine would come from her own personal experiences as a patient and that her legacy would be inspiring colleagues, teachers and friends about human dignity and compassion in the face of incredible adversity. Emma Bakes died of cancer on February 28, 2011 just shy of her 43rd birthday. She had hoped to attain her Doctor of Medicine degree this June, having filled all the requirements even when struggling with the pain and suffering of illness. We are working to be able to present her MD degree posthumously to fulfill her wish and that of her family but also to help celebrate her incredible life – a life that now lives on in her four-year old son Titan and her partner Donald Mendoza.

Medicine was not Emma's first career. She joined Stanford as an accomplished astrophysicist and scholar. Inspired as a young girl by Carl Sagan, she followed a path that included a PhD in astrophysics, positions at Princeton and Vassar, and research positions at the NASA Ames Research Center (ARC) and the SETI (Search for Extraterrestrial Intelligence) Institute. Her scholarship included peer reviewed publications and a book entitled "The Astrochemical Evolution of the Interstellar Medium." Emma was highly admired by her community at the NASA ARC and the SETI Institute, but she also yearned to have a human impact in addition to pondering life in the universe. That led her to a new journey and ultimately to Stanford Medical School, where she transformed her identity from teacher to learner and expert to student with a renewed sense of mission and commitment. Even when she was diagnosed with cancer as a medical student she persisted in her quest for knowledge and humanism. Her style was unique and ebullient as well as vulnerable because of her life's journey and the new impact of disease. But her commitment to her son, partner, family and friends was deep. A glimpse of her spirit is captured in an essay she wrote just months before her death entitled "The Shore of the Cosmic Ocean: A confluence of Humanity and Science" (see: http://scienceblogs.com/SETI/2011/02/the_shore_of_the_cosmic_ocean.php).

On April 28th a Memorial Service was held at the SETI Institute to commemorate Emma's life. It was organized with care and love by her partner, Donald Mendoza (also Titan's father), along with Judy Martelli, and it brought together friends and colleagues from the cross-sections of her life that were intertwined into the special network that Emma had weaved by her very personal way of connecting science and humanism.

While we can celebrate the contributions she made as a scientist and scholar, we cannot help but mourn the fact that generations of patients will not benefit from her ministrations as a caring physician. Her memory will certainly be sustained in her family and all who came to know Emma. We plan to further sustain the memory of Emma Banks through a scholarship in her name and the hope that her story will inspire future generations of students to love and care for the links between humanism and science.

Annual Visit by the School of Medicine National Advisory Council

On Monday May 2nd the School of Medicine National Advisory Council (NAC) conducted their annual review. After a day packed with presentations, discussions and reflections, they offered their preliminary findings and recommendations to John Hennessy, President of Stanford University. The NAC has played an important role in making sure that the medical school's strategic compass is directionally correct and that its path is sound and excellent.

The NAC members included a wide range of experts in medicine, science and academia. The chair of the NAC is **Dr. Ed Benz**, President of the Dana Farber Cancer Institute, Harvard University. NAC members include: **Dr. Huda Akil**, Co-Director of the Molecular and Behavioral Neuroscience Institute and Professor of Neurosciences, University of Michigan; **Dr. Tom Boat**, Professor of Pulmonary Medicine and Executive Associate Dean, University of Cincinnati College of Medicine; **Dr. Jennifer Rubin Grandis**, Vice Chair of Research and Professor of Otolaryngology and Pharmacology, University of Pittsburgh School of Medicine; **Dr. Helen Hobbs**, Director, McDermott Center for Human Growth and Development and Professor of Internal Medicine and Molecular Genetics, UT Southwestern Medical Center; **Dr. Larry Kaiser**, Senior Executive Vice President and Dean, Temple University School of Medicine and CEO of the Temple University Health System; **Dr. Dan Lowenstein**, Professor of Neurology and Director of the Physician Scientist and Education Programs at UCSF School of Medicine; **Dr. Trudy Mackay**, Professor of Genetics, North Carolina State University; **Dr. Betsy Nabel**, President of the Brigham & Women's Hospital; **Dr. Arthur Rubenstein**, Executive Vice President and Dean, University of Pennsylvania School of Medicine; and **Dr. Bill Stead**, Director of the Informatics Center and Associate Vice Chancellor for Health Affairs, Vanderbilt University Medical Center

The issues and topics comprising the annual NAC visit agenda have varied over the years from singular themes to a more varied agenda. This year's meeting fell into the latter category. It began with a "State of the School" overview that I delivered. In my remarks I updated the School's overall performance (e.g., financial recovery in consolidated revenues, profits, endowment income, reserves, patent income, gifts) as well as our success in research grants and clinical income. While both of these sources of revenue represent major immediate threats, we have done well in the past couple of years, with research expenditures (outside of ARRA funding) up by about 10% for the past two years and clinical income rising (up 7% this past year). However, given the economic conditions impacting support for research and the uncertain impact of healthcare reform, a considerable feature of my opening presentation and the discussion that followed was about how Stanford is preparing for the challenging times that are ahead.

One aspect of this important institutional preparation is the integrated planning we have been doing with both the Lucile Packard Children's Hospital and the Stanford Hospital & Clinics (SHC). Accordingly, an important presentation to the NAC was on our integrated clinical and academic planning – focusing on the School and SHC. **Drs. Alan Yeung**, Li Ka Shing Professor and Clinical Chief of the Division of Cardiology in the Department of Medicine, and **Dr. Bobby Robbins**, the Thelma and Henry Doelger Professor and Chair of the Department of Cardiothoracic Surgery and Director of the Cardiovascular Institute, presented updates on the status of planning in the Cardiovascular Institute (CVI). They described the comprehensive

integrated plan for the CVI that has emerged from an effort lasting nearly a year. It addresses several key disease management centers that cut across inpatient and ambulatory centers and that include both treatment and prevention strategies along with key efforts in innovation and technology. An important feature of this integrated planning has been the coordination of services (e.g., cardiology, cardiovascular surgery, vascular surgery), each traditionally existing in silos but now connected into a more integrated model of care and disease prevention and research.

In tandem with the update on integrated planning in the CVI we also shared the status of planning for the Cancer Institute. **Dr. Bev Mitchell**, George Becker Professor and Director of the Stanford Cancer Institute, and **Dr. Doug Blayney**, Medical Director of the Stanford Cancer Institute and Professor of Medicine, led the discussion with input from **Dr. Sri Seshardri**, SHC Vice President for the Cancer and Cardiovascular Institutes.

Integrated clinical planning with SHC has become a major initiative and is highly supported by Amir Rubin, President and CEO at SHC. Indeed, in addition to the discussions with the NAC, recent presentations have been the focus of half day retreats with the clinical department chairs and, separately, with hospital and school staff administrative leaders. Amir Rubin and I have been at each of these sessions, and they represent a new level of collaboration between the school and the hospital. In addition to our focus on major themes like cancer, cardiovascular, neuroscience and transplantation, we have also had dialogue about our future efforts in primary care as well as network development. These integrated planning activities are a critical aspect of our preparation for dealing with the rapidly changing healthcare environment in California as well as nationally.

We also had the opportunity to engage the NAC in two other important discussions. The first was the important topic of developing novel and creative approaches to flexible career pathways for faculty across the entire span of the career. **Drs. Hannah Valantine**, Senior Associate Dean for Diversity and Leadership and Professor of Medicine, and **Christy Sandborg**, Chief-of-Staff at LPPH and Professor of Pediatrics, led this discussion. They and their colleagues have built on recent discussions (including one held at our January 2011 Strategic Planning Leadership Retreat [see: http://deansnewsletter.stanford.edu/archive/01_24_11.html#1]) to develop a novel proposal called “Academic Biomedical Career Customization.” The NAC engaged in a thoughtful discussion of this intriguing project and offered a number of helpful insights and suggestions that will be considered as the pilot phase of this program begins this Fall.

A different focus of discussion with the NAC was a consideration of the future of biomedical libraries and knowledge centers in the age of information technology and rapidly changing financial models for controlling access to information development and flow. Following a presentation by **Heidi Heilemann**, Associate Dean for Knowledge Management and Director of the Lane Library, and **Dr. Henry Lowe**, Senior Associate Dean for Information Resources and Technology and Associate Professor of Pediatrics, the NAC discussed the rapidly changing knowledge acquisition and sharing landscape and the need for new models to sustain the library of the future.

Following a tour of the Li Ka Shing Learning and Knowledge Center and, in particular, the Goodman Simulation Center led by **Dr. David Gaba**, Director of the Center for Immersive and Simulation Learning and Professor of Anesthesia, the NAC heard presentations on the future of medical education led by **Dr. Charles Prober**, Senior Associate Dean for Medical Education and Professor of Pediatrics. Dr. Prober and his colleagues updated the group on work that began with discussions held at our August 2010 Think Tank on Medical Education (see: http://deansnewsletter.stanford.edu/archive/08_30_10.html#2) and was further developed at our the January 2011 Strategic Planning Leadership Retreat (see: http://deansnewsletter.stanford.edu/archive/01_24_11.html#1). Based on these earlier discussions, Dr. Prober has appointed four work groups that will examine different facets of medical education (from undergraduate to graduate and postgraduate training) in four interconnected areas: 1) Patient Centered Learning; 2) Knowledge Retrieval and Integration; 3) Coaching, Mentoring, and Advising; and 4) New Learning Strategies and Pathways.

To help frame the discussion about the future of medical education, **Matt Goldstein**, SMS 6+ MD/PhD student, reflected on his experience and how that might inform how medical education is conducted in 2021. Given their leadership roles in the committees mentioned above and their overall contributions to medical education, four faculty leaders contributed to the discussion. They included **Dr. Clarence Braddock**, Associate Dean for Medical Education and Professor of Medicine, **Dr. Henry Lowe** (see above), **Dr. Laura Roberts**, McCormick Professor and Chair of the Department of Psychiatry, and **Dr. Abraham Verghese**, Professor and Senior Associate Chair of the Department of Medicine. Several models for the future of medical education that ranged from evolutionary to revolutionary were discussed with the NAC. These will be further explored and discussed over the months ahead.

The final major theme of the NAC visit was a review and update on the Department of Bioengineering, which was established seven years ago. This department is unique in the University in being jointly sponsored by the Schools of Engineering and Medicine. **Dr. Russ Altman**, Boston Scientific Chair and Professor of Bioengineering, Genetics and Medicine, provided an historical overview of how the department was formed, how it has been developed and where it is heading in the future in education and research as well as in translational medicine. **Dr. Jim Plummer**, Dean of the School of Engineering, participated in the discussion.

As you can gather, the NAC visit was filled with a lot of exciting presentations. They reflected the range of important domains that comprise the School of Medicine – from education to research and patient care as well as support for faculty and for the resources that are needed to make us unique during times of change. They also represented a range of states of completion, from initiatives well on the way to implementation to those whose ideas are still under development. As noted above, the NAC shared their preliminary observations with President Hennessy and will provide a more formal report in the next months (as they have done in past years). They did seem stimulated by the discussions and for that I thank our faculty, students and staff. I also extend my appreciation to **Dr. Kathy Gillam**, Senior Advisor to the Dean, **Mira Engel** and **Jana Baldwin** for all the work they did in helping the NAC visit be so successful.

Spectrum Continues to Make Progress

Thanks to the leadership of Dr. Harry Greenberg, Senior Associate Dean for Research and Joseph D Grant Professor in the Department of Medicine, and his colleagues, Spectrum (aka the Stanford Clinical and Translational Science Award) continues to make progress. This message was conveyed clearly on Tuesday May 3rd at the annual visit of the External Advisory Board, which reviewed progress in bioinformatics; operations, training and compliance; the clinical and translational research unit; innovations and pilots; and community engagement. The early feedback has been extremely positive.

In addition, Spectrum trainees have been successful in their participation on the national stage, nine of whom gave presentations at the 2011 Clinical and Translational Research and Education Meeting in Washington D.C. The presentations included:

- **Lilian Lam**: Characterization of Nontyphoidal Salmonella Strains Isolated from Patients in South Africa
- **Hiwot Araya & Ehete Bahiru**: A retrospective Study of Mortality and adherence among HIV/Aids patients at Alert Hospital
- **Benjamin Seligman**: Postsixty Mortality and Transition in the Global Burden of Disease
- **Shushmita Ahmed**: How does Motivation Affect Postoperative Weight Loss?
- **Kathryn Sepelyak**: Patterns of Verbal Defects in Children with Chromosomal Abnormalities
- **Aditi Mallick**: Chronic Stress and Salivary gene expression
- **Rashmee Shah, MD**: Atrial Fibrillation Ablation Outcomes
- **Roxana Daneshjou**: Whole Exome Analysis of African Americans in High- and Low – Doses of Warfarin

The Emerging Debate About Graduate Education

During the last year we have had a number of discussions about the education of medical and graduate students as well as postdoctoral fellows. In October 2010 we convened a think tank on PhD education (see: http://deansnewsletter.stanford.edu/archive/10_11_10.html#3), and we continued to discuss issues raised there at our January 2011 Strategic Planning Leadership Retreat(see: http://deansnewsletter.stanford.edu/archive/01_24_11.html#1). Our focus has been broad. It has included a dialogue about our goals, objectives, expectations and funding for graduate students coupled with the realization that there are not enough academic positions to accommodate all PhDs being trained – along with expressions by a number of students of interest in other career pathways and opportunities outside of academia. Our discussions have been far ranging but our actions, to date, have been relatively limited. That said, our current reflections on PhD education have been timely in light of recent commentaries, position statements and national task forces that are challenging assumptions about the viability of graduate education – in the US and globally.

For instance, the April 21 issue of Nature featured several provocative commentaries with titles like “*The PhD Factory*”(see: <http://www.nature.com/news/2011/110420/full/472276a.html>) and “*Rethinking PhDs*” (see: <http://www.nature.com/news/2011/110420/full/472280a.html>). The dominant theme is that too many PhDs are being produced around the world for a shrinking job market – in academia, industry and elsewhere. This is consistent with comments we heard during our internal discussions, but our viewpoint was tempered by the reality that opportunities for PhD graduates are impacted by where they received their degree and how they were educated –

clearly not all PhDs in science are equal. Needless to say, we are fortunate at Stanford to have incredibly talented students in our PhD programs – but even for them opportunities are still limited, either by what is available or by the choices they make along the way.

Even though we began our discussions about rethinking the future of graduate education as a Stanford initiative, it is clear that others are thinking similarly, and some agencies will likely drive agendas that could affect graduate education. Among the most important is the recently announced panel sponsored by the NIH that will look into the future of graduate education. Dr. Shirley Tilghman, President of Princeton University and a highly respected scientist, will chair the panel (see: <http://news.sciencemag.org/scienceinsider/2011/04/nih-panel-tackles-makeup-of-the.html>). According to a recent interview, Tilghman notes that “the root of the problem” is the overproduction of PhDs. She adds: *“As a consequence, there are too many people chasing too few jobs and too few grant dollars. This problem will only get worse in the next decade, given the current federal budget. I believe there could be changes made to the structure of the typical biomedical research laboratory. The typical lab consists of about 10 trainees, a technician, and a principal investigator. The majority of those trainees will not become principal investigators, because those jobs are not multiplying. And at the moment, there aren’t enough career alternatives to capitalize on the time investment of these trainees. So I think we need to change the scenario.*

From years of being a mentor, I know that not all students want a career running their own lab and raising money. Instead, they want to do what they love: research. Perhaps more members of a lab could be permanent employees, and fewer could be trainees. We need to explore such options.”

While our Stanford discussion on graduate education will continue, it seems inevitable that whatever emerges from our deliberations will be affected by the work of the NIH panel. Clearly both are worth following.

University Faculty Senate Approves New Degree Programs

On April 28th, the Senate of the Academic Council of Stanford University approved a new School of Medicine PhD program on Stem Cell Biology and Regenerative Medicine, perhaps the first of its kind in the US (see: <http://med.stanford.edu/ism/2011/april/stem-phd.html>). The decision to proceed with this degree has been the focus of considerable and thoughtful review and is ultimately based on the assessment that this is a unique and clear discipline – and one where Stanford can provide leadership. Special thanks and commendation must be given to Dr. Renee Reijo Pera, Professor of Obstetrics and Gynecology and Director of the new PhD program, and Dr. Theo Palmer, Associate Professor of Neurosurgery and Co-Director of the doctoral program.

In addition, the Senate also approved the proposed MD-JD degree program that has been developed by leaders in the Schools of Law and Medicine. This provides yet another unique career path for Stanford Medical Students. Next in the pipeline is the MD-MPP (Master in Public Policy) joint degree.

The Art of Listening and Communicating with Patients

As we constantly discover new ways of caring for the patients we serve, it is equally important to reaffirm the importance of the way we communicate with our patients, listen to their concerns and show in our actions the value of the doctor-patient relationship. A brief commentary on this topic that I co-authored with Dr. Wendy Levinson, Professor and Chair of the Department of Medicine at the University of Toronto, appeared in the May 4th issue of the Journal of the American Medical Association (JAMA). The commentary is entitled “Patient-Physician Communication: It’s About Time” (see: <http://jama.ama-assn.org/content/305/17/1802.full>). Our Office of Communication and Public Affairs pursues this topic further in its “5 Questions” series – see: <http://med.stanford.edu/ism/2011/may/5q-pizzo-0509.html>.

Department of Pediatrics Hosts its Second Research Day

Annual departmental retreats are an important feature in the life of virtually every basic science department at Stanford. They present opportunities for sharing new findings, fostering new ideas and developing community by bringing students, trainees and faculty together. Clinical departments also host retreats since they are also a great opportunity for networking, particularly when the faculty and trainee sizes are multiples of the basic science programs. The Department of Pediatrics held its Second Annual Research Retreat on Friday, April 22nd to feature and help celebrate the work of trainees, junior faculty and established investigators. Indeed 190 individuals participated in the Retreat, which was held at the Quadrus Conference Center. Awards were given to trainees and junior faculty for their research projects and included (for first and second place):

- **Pediatric Residents:** Jane Maclean, MD and Jason Bacha, MD
- **Clinical Fellows:** Anne Hsui, MD and Preston Lavinghousez, MD
- **Postdoctoral Fellows:** Paul Valdmanis, PhD and Scott Metzler, PhD
- **Instructor in Pediatrics:** Kara Davis, MD and Alexis Davis, MD

The “Rules of Practice” Are Updated for Stanford Faculty

Although revisions to policy in this area have been long in the making, we now have the final edition of the *Practice Policy for the Physicians and Psychologists in the School of Medicine*. This policy, which will be effective May 15, 2011, replaces the current *Rules of Practice for the Faculty Physician*. It addresses the clinical care activities and reviews generated by physicians – including the approved sites for clinical practice and the approved payment mechanisms for clinical services. It also addresses such issues as telemedicine and practice in states or countries outside the licensed jurisdiction, and it provides the process by which exceptions or clarifications to its provisions may be sought. It is important for all physicians and psychologists who have faculty appointments at the School of Medicine to be cognizant of this policy and adhere to it. If you have any questions please contact Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs (nrizk@stanford.edu), or Dr. Ann James, Senior University Counsel, Office of the General Counsel (anjames@stanford.edu).

Because this policy has not been revised for some time, I am including it below to ease your ability to review it. It is also available on-line in the School of Medicine Faculty Handbook (<http://med.stanford.edu/academicaffairs/handbook/chapt10.html#practice>).

Practice Policy for the Physicians and Psychologists in the School of Medicine

I. **Scope and Purposes**

This Policy governs all physicians and psychologists in the School of Medicine involved in clinical care activities (Clinicians) and the revenue generated by such Clinicians. Every Clinician has made a written commitment to comply with the Rules of Practice for the Faculty Physician (Faculty Handbook

2.103, <http://med.stanford.edu/academicaffairs/handbook/2.103.doc>), and this policy updates and replaces these Rules. The clinical care activities and revenue of all Clinicians shall be governed by this Policy. Except as provided in this Policy, full-time Clinicians (as defined below) may not have or maintain a private practice of medicine.

II. **Definitions**

A. ***Individuals Covered by the Policy***

All Clinicians who engage in patient care services as part of their employment at Stanford University are covered by this Policy. This policy excludes trainees (including trainee/instructors), who are covered under different policies but includes part-time faculty.

B. ***Practice Income***

1. Practice income is all Clinician medical fee-for-service or contract income derived from direct, indirect or consultative patient care services requiring physician or other licensure, whether such activities are recurrent or non-recurrent in nature, provided by the Clinicians as part of their employment by Stanford University, regardless of the source of payment for those services or the purpose for which the Physician service/opinion is rendered. In addition, income generated by adjunct Clinicians who engage in patient care may be practice income when performed as part of their Stanford duties. All practice income shall be assigned to Stanford Hospital and Clinics ("SHC") or Lucile Packard Children's Hospital ("LPCH") by all Clinicians who generate such income. Except as provided in this Policy, none of such persons shall have any right or title to such practice income. Nonclinical activities of individual Clinicians shall not be covered by this Policy.
2. Consulting on disputed medical claims or testifying as an expert witness on the medical condition or treatment of any person is excluded from practice income when the service meets all of the following criteria:
 - (a) Is based solely on a review of medical records (including x-rays, tracings, lab results and photographic material) of a person who is not a current patient of any Clinician or of SHC or LPCH, AND
 - (b) Does not involve use of any SHC or LPCH staff, laboratories or other facilities, AND
 - (c) Does not involve personally examining or interviewing the person.

3. Practice income includes all medical direction income, including but not limited to income from serving as a medical director for any diagnostic or therapeutic facility, or any other nonprofit or for-profit enterprise where the medical director has responsibility for the quality of medical service(s) rendered.
 - (a) Payment for serving only as a member of an advisory board or governing board of such an organization is not practice income but is subject to disclosure as a possible conflict of commitment or interest.
 - (b) Any Clinician whose commitment to Stanford is part-time (that is, any commitment less than 100% or 1 FTE):
 - i. If the Clinician receives no benefits from Stanford (generally meaning less than 50% time), a list of other employer(s) shall be provided to the Senior Associate Dean for Academic Affairs, to be included in the Clinician's personnel file
 - ii. If the Clinician receives partial benefits from Stanford (generally meaning less than 75% time but more than 50% time), the Clinician must obtain an exemption from Practice Income for any clinical income which is unrelated to the Clinician's Stanford commitment. Such an exemption must be in writing, agreed to by the Division Chief and Department Chair, approved by the Senior Associate Dean for Academic Affairs, and documented in the Clinician's appointment letter or, for an already-employed Clinician, in an annual letter of agreement.
 - iii. If the Clinician receives full benefits (generally meaning 75% time or more) but is less than 100% time, the Clinician must obtain an exemption from Practice Income for any clinical income which is unrelated to the Clinician's Stanford commitment. Such an exemption must be in writing, agreed to by the Division Chief and Department Chair, approved by the Senior Associate Dean for Academic Affairs, and documented in the Clinician's appointment letter or, for an already-employed Clinician, in an annual letter of agreement.
4. No exception to this Policy will be effective unless such exception has been reviewed and approved in writing by the Chair and Division Chief of the relevant Clinician's Department and the Senior Associate Dean for Academic Affairs, and malpractice coverage has been agreed to by SUMIT or separate malpractice coverage is provided, is satisfactory to the School and to SUMIT, and is documented in writing.
5. Resolution of questions on whether specific types of payments are practice income or can be received as personal payments will be resolved by the Senior Associate Dean for Academic Affairs.

III. Approved Practice Sites

1. The approved practice sites for the Clinicians are the facilities of SHC and LPCH, and other hospitals and ambulatory care facilities, including the Blood Center, owned, or managed by, or under an affiliation or other agreement with the University or SHC or LPCH; and other health care agencies, institutions, and

places designated by the Dean or his or her designee as sites of approved practice. The requirement to practice only in approved practice sites applies to all international as well as domestic locations. The specific practice site or sites for any individual Physician will be determined by the cognizant Chair or Division Chief.

2. No full-time Clinician may ever maintain a clinical practice outside of the approved practice sites. The practice location requirements for part-time Clinicians are defined in the individual's employment letter, as approved by the relevant Department Chair and the Senior Associate Dean for Academic Affairs, and, for international sites, the Senior Associate Dean for Global Health.
3. The provision of telemedicine services should be reviewed for licensure requirements on a case by case basis. State laws vary, and may change from year to year or as a result of litigation. Such practice should be governed under a contract for outreach and be confirmed for coverage with SUMIT prior to undertaking any services.
4. Provision of Clinician services at sites other than approved practice sites on a routine or non-recurring basis must be approved in advance by the Senior Associate Dean of Academic Affairs and the Department Chair and documented in writing. Any income derived from such activities shall be practice income. Rendering emergency care (a "good Samaritan" action) is an exception to such restriction on practice location.
5. Contact through the internet, whether by an affected individual, another clinician, or a family member of an affected individual, should be thoughtfully reviewed and, if an answer is deemed appropriate, may be provided with the following disclaimer: *"NOTE: My response to your question is not medical advice but my informal assessment of the [photo/description/] you have sent. My assessment is not a basis for any action or inaction for this individual, and, as with all medical issues, is not intended to nor does it replace the evaluation and determination of a medical professional who can make a diagnosis and render appropriate care. I have not had the opportunity to review the complete medical records nor had the opportunity to examine [you/the patient]; my assessment can only be based upon the limited information [you have/I have been] provided."*

IV. **Malpractice Coverage**

0. Malpractice coverage is provided only for patient-related activities performed by Clinicians as part of their official duties within approved practice sites, including outreach locations to which Clinicians are assigned as part of their duties.
1. SUMIT malpractice insurance has specific restrictions and provisions for coverage. Each licensed Clinician considering any clinically related activity outside an approved practice site should consult the Senior Associate Dean for Academic Affairs and the Insurance Manager for SUMIT. All questions or issues regarding coverage or any request for any exception should be resolved with SUMIT and confirmed in writing with SUMIT, the Senior Associate Dean for Academic Affairs and the Department Chair.

V. **Unauthorized Practice of Medicine**

Under no circumstances may any Clinician practice medicine outside of the location in which he or she is licensed. For example, a Clinician licensed only in California may not

provide clinical care outside of California, whether in the United States or any other jurisdiction, barring the application of special circumstances allowing such practice. Any Clinician considering practice outside a jurisdiction of licensure should consult the Senior Associate Dean for Academic Affairs to determine whether any exception applies.

- VI. **Rights and Obligations of Clinicians** Clinicians shall have the rights and obligations respectively provided for them in their individual appointment letters, this Policy and all applicable University, School and Department rules, regulations, and policies. Each Clinician shall have the obligation to know and understand such requirements, and, if in doubt, shall be obligated to obtain answers from the cognizant Chair or the Senior Associate Dean for Academic Affairs.

- VII. **Duties of Clinicians**
All Clinicians shall provide services to patients in the respective hospitals and other locations in which they serve, respecting and following all relevant policies, rules and regulations including but not limited to those related to patient care, billing and compliance.

- VIII. **Effective Date**
This Policy is effective on May 15, 2011 and replaces the Rules of Practice for the Faculty Physician.

Medical Students Advocate for Bike Safety

In past issues of the Dean's Newsletter and in other forums I have raised serious concerns about bicycle safety on the Stanford campus. Of particular concern is the fact that many students (or more appropriately bike riders) do not wear helmets (while there are more formal surveys, I generally count about only 1 in ten wearing helmets). An equally low number - or fewer - do not have reflective gear or lights on their bicycles – something I note virtually every night as I drive home. It is scary. And to make matters worse, a shockingly few number actually obey road traffic signs – including stop signs. While not wanting to be overly hyperbolic, I believe I have seen the potential for an accident virtually every time I drive home at night; it is only vigilance and extreme caution that saves the day – but that is no assurance that an accident will not occur in the future. This is all despite the enormous amount of work that has been done by the University and especially Ariadne Scott, who has put amazing programs in place to enhance education and safety on campus (see: http://transportation.stanford.edu/alt_transportation/BikingAtStanford.shtml). And while progress has been made, the lack of attention to bike safety – or its extinction over time by students – is notable and worrisome.

Now an admission of personal judgment. I often thought that the biggest problems in this area were among undergraduate students and that graduate students, faculty and staff would be more attentive to safety issues (or feel less omnipotent) and that students and trainees in the medical school would exercise greater attention to bicycle safety. This turns out to be false – as I have personally observed and others have recorded as well. So, before complaining further about the broader university, we clearly have work to do in the medical school.

Hence I was especially pleased when a group of first year medical students took leadership on bicycle safety and arranged a meeting with Ariadne Scott (from Parking & Transportation Safety) along with Dr Charles Prober and me. The SMS1 students are Anthony Kaveh, Sneha Shrestha and Nancy Yerkes. They expressed a commitment to help improve safety in the medical school first and then carry that to the university on a student-to-student basis. This is a terrific idea, and I share it to alert you once again to the problems we have with safety and also to encourage you to work with our students and, of course, for our students to work with each other. Creating a culture of safety is hard – but it can be done, and we owe it to each other to help do that for our students, staff and faculty. Please help!

Stanford Hosts Western AAMC

On April 30 – May 3rd the School of Medicine hosted the annual American Association of Medical Colleges (AAMC) Western Regional Conference. Thanks to the diligence and hard work of faculty and student leaders, the event was a tremendous success by virtually every measure. Registration for the conference exceeded all expectations. Based upon prior meetings, 350 attendees were anticipated, but over 500 registered. Most participants were faculty, staff and students from medical schools, residency programs and undergraduate institutions. However, the conference also attracted professionals from schools of dentistry, podiatry, pharmacy, optometry, chiropractic, and traditional Chinese medicine.

The immediate feedback from attendees regarding the quality of the meeting has been outstanding. Compliments reflect on the organization of the meeting, the almost flawless events schedule and the venue, which featured the Li Ka Shing Center for Learning and Knowledge.

The success of this meeting also reflects the incredibly hard work of faculty and staff. I want to thank the three program chairs:

- Dr. Clarence Braddock, Associate Dean for Medical Student Education
- Dr. Gabe Garcia, Associate Dean for Medical Student Admissions
- Dr. Pree Besaviah, Director, Practice of Medicine

I also want to thank the great work of the individuals and teams that made the program so successful. They include Cindy Irvine (Assistant Dean for Medical Education) and Char Hamada (Assistant Dean for Student Affairs) along with Kim Osborn, Bahij Austin, Zera Murphy, Christine Solari, Brian Tobin, Juhn Verano, Ray Jackman, Tomiko Oskotsky and the terrific volunteers from Student Life, Admissions, Division of Evaluation, EPS Finance and Administration, Educational Technology, Simulation Program, Standardized Patient Program, Financial Aid, Registrar's Office, Medical Student Research and Scholarship, Medical Science Training Program and the Center of Excellence.

Stanford Medical School shined brightly at the Western Regional AAMC meeting – and for that we are all grateful.

Aligning Immersive Learning and Medical Education

In an effort to further align immersive learning with medical student education, the Center for Immersive and Simulation-based Learning (CISL) led by Associate Dean David M. Gaba, MD has changed its administrative home from Information Resources and technology, under Senior Associate Dean Henry Lowe, M.D., to Educational Programs and Services under Senior Associate Dean Charles Prober, MD. This change was effective May 2nd. CISL includes the School of Medicine's programs of Immersive and Simulation Learning (ISL), the direction and management of the Hon Mai and Joseph Goodman Immersive Learning Center on the Ground Floor of the Li Ka Shing Center, and a Consortium of groups and facilities engaged in ISL activities in the Stanford family of institutions (SoM, SHC, LPCH, and VA Palo Alto HCS).

The Loss of Two Extraordinary Stanford Medicine Alumni

I noted above the tragic loss of our student Emma Bakes. Over the past week medicine lost two distinguished leaders – both graduates of the School of Medicine.

Dr. Jim Mongan was a 1967 graduate of the School of Medicine. His life was dedicated to public service in many venues across the US and world. His commitment to improving the world characterized the journey of his life. He served in the White House under President Jimmy Carter, was later president of the Truman Medical Center in Kansas City and then served as president of the Massachusetts General Hospital and finally as president and CEO of Partners HealthCare. He played a major role in the landmark health care reform that has occurred in the Commonwealth of Massachusetts. In addition to his enormous range of professional accomplishments, Jim Mongan was an incredibly genuine and caring individual of great integrity and commitment. He is deeply missed by all who had the honor to know and interact with him.

Dr. Jack Griffin was a 1968 graduate of Stanford Medical School and was to receive the Wallace Sterling Award with his wife Diane Griffin, also an incredibly accomplished scientist, in just a few weeks. Jack Griffin was an internationally acclaimed neuroscientist and was the founding director of the Johns Hopkins Brain Science Institute and former Director of the Department of Neurology at Johns Hopkins, where he served on the faculty for several decades. His accomplishments in science and medicine were remarkable and from them he won deep respect and admiration around the world.

Certainly every death and loss is important and has an impact on families, communities and organizations. These two Stanford Medicine alumni had incredibly distinguished careers in very different ways – but they epitomize what we value most – individuals who seek to make a difference and live their lives doing so. They will be missed but surely not forgotten.

2010 McCormick Faculty Awardees

The School of Medicine and the Office of Diversity and Leadership are pleased to announce the recipients of the 2010 McCormick Awards. These awards provide research/project funding to junior faculty women pursuing advancement, or to junior faculty men or women who support the advancement of women in medicine and/or medical research. The awards are supported by the McCormick Funds, which were established to support the advancement of women in medicine and/or medical research directly, or by supporting the mentoring, training and encouragement of

women pursuing the study of medicine, in teaching medicine, and engaging in medical research. This year 18 applications were submitted and the winners were chosen by a review committee that included: Ray Gaeta, Anne Brunet, Kari Nadeau, and Hannah Valantine. Three award winners each year will receive \$30,000 per year for two years.

This year's McCormick Award winners include:

- Katrin Chua, MD PhD, Assistant Professor in Medicine: **SIRT7: linking chromatin regulation to oncogenic transformation**
- Joyce Liao, MD PhD, Assistant Professor in Ophthalmology: **Laser-Assisted Stem Cell Transplantation to Treat Adult Vision Loss**
- Fan Yang, PhD, Assistant Professor in Orthopedic Surgery: **Combinatorial Development of Microarrays for Understanding Stem Cell Fate Regulation in 3D**

Congratulations to each.

Awards and Honors

- On May 3rd, 72 scholars from the US were elected to the National Academy of Sciences, one of the most prestigious honors in science. Of these eight were from Stanford University and three are School of Medicine faculty, with two others having joint appointments or associations with the medical school. The three School of Medicine faculty members elected to the NAS are:
 - *Dr. David Kingsley*, Professor, Department of Developmental Biology
 - *Dr. Brian Kobilka*, Professor and Chair, Department of Molecular and Cellular Physiology
 - *Dr. Rob Malenka*, Nancy Friend Pritzger Professor of Psychiatry and Behavioral Sciences and Co-Director, Stanford Institute for Neuro-Innovation and Translational Neuroscience

Also elected to NAS from Stanford with close ties to the School of Medicine are *Dr. Sue McConnell*, Susan B. Ford Professor in the Department of Biology (and also on the Executive Committee of the Stanford Institute for Neuro-Innovation and Translational Neuroscience) and *Dr. Keith Hodgson*, the David Mulvane Ehrsham and Edward Curtis Franklin Professor of Chemistry and Associate Lab Director for Photon Science at SLAC.

- *Dr. Bill Newsome*, Professor of Neurobiology and Investigator in the Howard Hughes Medical Institute, is one of 28 US scholars and leaders who was elected to the American Philosophical Society (APS) on April 29, 2011. Founded by Benjamin Franklin in 1743, the APS is the nation's oldest learned society and "promotes useful knowledge in the sciences and humanities through excellence in scholarly research, professional meetings, publications, library resources, and community outreach."

- **Dr. Alan Schatzberg**, Past Chair Kenneth T. Norris, Jr Professor of Psychiatry and Behavioral Sciences, received the *Doctor Honoris Causa* from the University of Vienna, the oldest university in Austria.
- **Dr. John Ioannidis** was installed as the third incumbent of the CF Rehnborg Professorship on April 21st. Dr. Ioannidis joined Stanford this past year to lead the Department of Medicine's Stanford Prevention Research Center. The prior two incumbents of the Rehnborg professorship were Dr. Jack Farquhar, who founded the SPRC, and Dr. Steve Fortmann, who was the second director, preceding Dr. Ioannidis.
- **Dr. Preetha Basaviah**, Clinical Associate Professor, has received the Society of General Internal Medicine National Award for Medical Education.
- **Dr. Axel Brunger**, Professor of Molecular and Cellular Physiology, of Neurology and Neurological Sciences, of Photon Science and, by courtesy, of Structural Biology, has been named the winner of the American Society of Biochemistry and Molecular Biology's inaugural DeLano Award for Computational Biosciences.

Congratulations to all.

Appointments and Promotions

Mildred Cho has been promoted to Professor (Research) of Pediatrics, effective 5/01/11.

Cheryl Koopman has been promoted to Professor (Research) of Psychiatry and Behavioral Sciences, effective 5/01/11.

Jianghong Rao has been promoted to Associate Professor of Radiology, effective 5/01/11.

Dean's Newsletter

Thinking About Population Sciences at Stanford

On Saturday morning, May 21st, we held a retreat designed to think about the future of population science at Stanford. It was incredibly informative and highly successful in bringing a broad and diverse community of scholars and experts together with the goal of reflecting on how we can make our individual and collective efforts more successful – and ideally make our total impact bigger than the sum of our respective parts. Forty-five faculty from three schools and 24 different divisions or departments in the University and Stanford Hospital joined together in this discussion and dialogue. Dr. Jack Rowe, Professor of Health Policy and Management at the Columbia University Mailman School of Public Health, attended as special guest and consultant. Dr. Rowe has extensive experience as a leader in academic medicine and the private healthcare market and has spent time at Stanford over the past two years.

The impetus for the retreat was the increasing recognition that population science is an important feature of the future of medicine. While we have been fortunate to have a number of incredibly talented faculty in population science, our efforts are highly dispersed in the medical school and throughout the university. We have also been fortunate in recruiting a number of highly talented faculty leaders in population science during the past several years. Coupled with these factors is the changing face of science and healthcare – at the NIH and in the public and private sector – that makes population science ever more important. At the same time, this is a diverse field that includes epidemiology, statistics, sociology, psychology, anthropology and health policy along with important intersections in disease disciplines (e.g., cancer) and in health and prevention.

Given our current strengths, it is important to ask how we can make them even stronger. While many academic centers approach population science through schools of public health, we have been clear at Stanford that we do not intend to pursue that pathway. Instead we are seeking broader interaction across the university and into the community with the goals of enhancing programs in education, research and clinical care delivery. While some might argue (and the issue was raised at the retreat) that the best way to bring faculty together is to create a shared facility, we also recognize that there are many other ways of facilitating interaction and collaboration. One example was this very retreat – which enabled a diverse group of faculty to meet and share their areas of interest and hopes for the future. (I would note that a number of faculty commented that simply getting together for this retreat had already spawned some new potential collaborations).

While many important views and perspectives were presented and shared, common shared themes emerged as well, including innovation (especially in the Stanford culture) and the importance of aligning social and biological sciences, of using new technologies and tools (such as cell phones and data tracking sources) that might connect personal, biological and social data, and of developing new tools that could reshape the field of populations sciences research. Resources that facilitate interaction or help handle large databases are other ways of moving a collaborative research agenda forward. There was a recognition that the term “population” should include molecules, cells, systems, bodies and communities of individuals and that efforts should focus on diversity, health disparities, age, behavior and various diseases (including emerging health problems like obesity).

The discussion at this first retreat was rich and provocative. The next steps will involve collating and organizing the various recommendations that came out of the retreat and then, in all likelihood, carrying out further explorations through small group discussions. It was not the intent of this first retreat to reach a conclusion or develop a plan – but rather to raise questions about opportunities, small and large, and help create an agenda for how we can support faculty and make Stanford’s efforts in population science the best they can be.

School of Medicine 2011 Staff Recognition

At a Friday May 20th reception in the Li Ka Shing Center for Learning and Knowledge (LKSC) we celebrated the wonderful work done by Stanford School of Medicine staff members who have been part of our community for five to more than 40 years. What makes institutions great is the

individuals who choose to work there – and we are fortunate in the medical school to have outstanding employees who work across all of our missions in education, research, patient care and community service along with the disciplines that enable their success – from finance and administration to information technology, philanthropy, communications and beyond. A second hallmark of a great institution is that employees stay for years and even decades, during which time they also evolve and contribute in new and exciting ways. While the public credit for work done at academic medical centers and universities more commonly goes to the faculty and students, the reality is that the work they do would not be possible without the incredible support and help they receive from the individuals who staff every one of our functions and activities.

We are a diverse and highly variegated institution, but there is a common thread that connects all of us. We are committed to improving the world by educating its future leaders, making the discoveries and innovations that will transform knowledge and helping to improve the care of the patients who come to us both for healing and for the preservation of their health and well being. I sometimes think about the breadth and myriad talents of our community in the same way that I think about the starting line of a marathon. At the start of a race there are often thousands of individuals who have diverse backgrounds, a wide range of ages and life knowledge and experience, and highly individual goals and personal aspirations. But they are joined together in a new organic connection that ultimately moves each individual first as part of a shared experience and ultimately as an individual journey – at her or his own pace and comfort – to a common goal.

In some ways we do that in our special work environment. We also line up each day at Stanford in our real and virtual space and then move individually and collectively toward the shared goal of improving the human condition. Many times our connections and interactions are not apparent but, in time, our individual and joint efforts have a real impact. In that spirit I want to thank all of the exceptional individuals who work at Stanford and who truly make a difference. At this moment, many Americans are out of work, and many who are employed are in jobs they find less than fulfilling. We are fortunate to work in an exciting and meaningful environment that has a valuable mission and that is greatly enhanced by the quality and commitment of our work community.

We attempt to acknowledge and celebrate our staff employees year round, but we are also pleased to host this annual reception to thank individuals who have achieved milestones of time at Stanford or exceptional performance. The name of each individual who has spent 5, 10, 15, 20, 25, 30, 35 and 40 years at Stanford is mentioned at the Employee Recognition website (see: <http://med.stanford.edu/employeerecognition/>). At the reception we highlighted the individuals who have spent 35 and 40 years at Stanford. Their bios are included on the website, and they include:

Employees with more than 35 years of service:

- **Marilin Masek**, Pathology - see: http://med.stanford.edu/employeerecognition/honorees/35years/Marilyn_Masek.html
- **Cecele Quaintance**, Pediatrics - see: http://med.stanford.edu/employeerecognition/honorees/35years/Cecele_Quaintance.html

- **Back-Hong Tran**, Research management Group – see:
<http://med.stanford.edu/employeeerecognition/>)
- **Hendrik Vreman**, Pediatrics – see:
http://med.stanford.edu/employeeerecognition/honorees/35years/Hendrik_Vreman.html
- **Judith Washborn**, Information Resources & Technology – see:
http://med.stanford.edu/employeeerecognition/honorees/35years/Judith_Washburn.html

Employees with more than 40 years of service:

- **Virginia Fowkes**, Medicine, Family and Community Medicine – see:
<http://vascular.stanford.edu/profiles/frdActionServlet?choiceId=facProfile&fid=3997>
- **Tim Gadus**, Facilities Planning and Management – see:
<http://med.stanford.edu/employeeerecognition/honorees/40years/>

Two awards, the *Spirit Award* and the *Inspiring Change Leadership Award*, recognize members of our staff who have been truly exceptional in carrying out their responsibilities. The Spirit Award recognizes two individuals who have won the respect of the Stanford community for their consistent dedication, initiative, motivation, attitude and service. The two winners of the 2010 *Spirit Award* are (see: <http://med.stanford.edu/employeeerecognition/awards/2010-spirit.html>):

- **Chris Shay**, Project Manager/Planner, Office of Facilities Planning and Management
- **Young Quoc Vu**, Course Coordinator for “Human Health and Disease,” Department of Pathology

The *Inspiring Change Leadership Award* is for individuals who have initiated work improvements and programs that have been transformative. The 2010 Inspiring Change Leadership Awardees are:

- **Sonia Barragan**, Associate Director, Research Management Group
- **Nancy Lonhart**, Associate Director and Administrative Manager, Department of Medicine and PCOR

I offer my deep appreciation to *all* of our wonderful staff.

Stanford Institute for Stem Cell Biology and Regenerative Medicine: An Update to the Executive Committee

At the May 6 Executive Committee meeting, Drs. Irv Weissman, Virginia & D.K. Ludwig Professor for Clinical Investigation in Cancer Research and Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine (ISCBRM), and Michael Longaker, Deane P. and Louise Mitchell Professor in the School of Medicine and Institute Co-Director, provided an update on the Institute. A summary of their remarks follows:

Since its founding nearly a decade ago initially as the Cancer/Stem Cell Institute under the leadership of Irv Weissman, the Institute for Stem Cell Biology and Regenerative Medicine has experienced significant growth and change. In 2005 the original Institute was divided into the separate Stanford Cancer Institute and the Institute for Stem Cell Biology and Regenerative Medicine (ISCBRM).

The leadership of the Institute for Stem Cell Biology and Regenerative Medicine, along with the Dean, raised over \$185,000,000 to establish the new Lorry I. Lokey Stem Cell Research Building. The Lokey Building (also known as the Stanford Institutes of Medicine 1) houses faculty focusing on stem cell biology and regenerative medicine from an array of disciplines that include cancer, neuroscience, cardiovascular, imaging and more

The ISCBRM has recruited a number of impressive researchers. Stem cell researchers at Stanford have garnered over \$198 million in grants from the California Institute for Regenerative Medicine, 32 percent more any other California institution. Thanks to the leadership and actions of Renee Reijo Pera, Theo Palmer, and Susan Prohaska, the Stanford University Faculty Senate approved the creation of a PhD program in stem cell biology and regenerative medicine on April 28th, which is the first doctoral program in the nation devoted solely to stem cell science and the first interdisciplinary doctoral program created by the School of Medicine in over 25 years.

Investigators at the institute are moving forward quickly on four scientific fronts, conducting research in embryonic stem cells, reprogramming normal cells from people into pluripotent stem cells or trans-differentiated tissue cells, cancer stem cells, and adult (tissue specific) stem cells. They have made impressive strides in each area. One example is the discovery by Irv Weissman and Ravi Majeti labs that cancers carry a CD47 marker, a “don’t eat me” signal, and that blocking this signal allows the macrophages of the innate immune system to attack the cancer. Translating this research into clinical treatments is the focus of a CIRM disease team grant, one of three awarded to Stanford out of 14 statewide.

Last year, institute scientists and other Stanford stem cell researchers from the Cancer Institute and SINTN took up residence in the new Lorry I. Lokey Stem Cell Research Building. This facility has a number of features that promise to accelerate research. By concentrating many of Stanford’s stem cell researchers in one spot, the building promotes cross-fertilization of ideas. Twenty percent of lab space (60 benches) has been allocated as “hotel benches,” which researchers from outside the building can use to collaborate with Lokey residents for a period of one to three years. The Lokey building also hosts powerful technologies, many of which are available to the wider campus as cores and service centers.

The course to an even brighter future is being set. One goal is to recruit several new faculty members, a process that is well underway. Another is to expand the existing Program in Regenerative Medicine, led by Institute co-director Mike Longaker, an effort that brings together stem cell researchers not only from the institute and the School of Medicine, but also from the other schools at Stanford, the hospitals and clinics, other area universities, as well as biotechnology, electronics and software companies throughout Silicon Valley. An overarching focus for the translational medicine efforts of these programs is the initiative

to build on stem cell related Stanford discoveries that are ready, or almost ready, for early stage clinical trials.

Thanks to Drs, Weissman and Longaker for their update, and we look forward to seeing the further exciting progress of the Institute.

The Wallace H Coulter Endowment Celebration

On May 9th Stanford celebrated a \$20 million award for translational research in the life sciences to the Department of Bioengineering. Stanford is one of five institutions to receive this award (which included a matching award from the President's Fund) from the Wallace H Coulter Foundation. The successful collaboration with the Coulter Foundation began with the leadership of Drs. Scott Delp and Paul Yock when they served as founding chair and co-chair of the Department of Bioengineering and has continued under the leadership of current chair Russ Altman and co-chair Steve Quake. This has been a wonderful collaboration and a highly successful program that offers some important insights.

The Stanford- Coulter program (see: <http://bioengineering.stanford.edu/coulter/grantinfo.html>) provides competitive seed grants to support collaborative translational research projects that involve co-investigators from the Department of Bioengineering and a clinical Department in the School of Medicine. The goal is to encourage and facilitate research that addresses an unmet clinical need that leads to improvements in healthcare and to commercial products.

Stanford-Coulter projects over the past several years have been highly successful and have addressed a number of important and interesting challenges. This is illustrated in the range of topics that comprise the five successful projects receiving funding in 2011. They include:

- *Rapid viral identification device using nanochannel FET detectors* — Annelise Barron, PhD, associate professor of bioengineering, and Michael Snyder, MD, professor of genetics.
- *Fast, pinhole camera-phone based imaging of oral cavity for early cancer detection* — Manu Prakash, PhD, acting assistant professor of bioengineering, and Michael Clarke, MD, professor of oncology.
- *A novel solution for temporary cardiac pacing* — Jeffrey Feinstein, MD, associate professor of bioengineering and of pediatric cardiology, and Paul Wang, MD, professor of cardiovascular medicine.
- *Portable respiratory acoustic monitoring device* — Thomas Krummel, MD, professor of surgery and of bioengineering, and Paul Sharek, MD, associate professor of pediatrics.
- *Minimally invasive creation of autologous venous valves for the treatment of deep venous insufficiency* — Paul Yock, MD, professor of bioengineering and of medicine, and Jason Lee, MD, assistant professor of surgery.

Special thanks to the Coulter Foundation for creating this award, and of course to our faculty and leaders in Bioengineering for the creative projects developed over the years and for their successful leadership and implementation of this program.

The First Stanford Medical Center Gala

On Saturday evening May 7th, the First Stanford Medical Gala was held at the Arrillaga Alumni Center. The inspiration for this event, with the purpose of creating an annual social gathering for community and faculty physicians associated with Stanford Hospital & Clinics, came from Dr. Brian Bohman, Chief of Staff at SHC (2008-2011). The Gala also seeks to honor outstanding clinicians who have provided excellent patient care at SHC. A highlight of the festive evening was the announcement of newly appointed “Lifetime Honorary Medical Staff.” The names of these distinguished physicians were announced by Dr. Ann Weinacker, incoming Chief of Staff, and included:

<i>Ronald L. Ariagno, MD</i>	<i>Anthony S. Felsovanyi, MD</i>	<i>Harry Oberhelman, MD</i>
<i>Richard R. Babb, MD</i>	<i>Alvin Hackel, MD</i>	<i>Brian T. Paaso, MD</i>
<i>Davis W. Baldwin, MD</i>	<i>James B.D. Mark, MD</i>	<i>George L. Paris</i>
<i>Karl G. Blume, MD</i>	<i>Thomas C. Merigan, Jr,</i>	<i>Louis W. Roloff, MD</i>
	<i>MD</i>	
<i>Melvin C. Britton, MD</i>	<i>Bryan D. Myers, MD</i>	<i>Edward Rubenstein, MD</i>
<i>Norman S. Coplon, MD</i>	<i>William H. Northway, MD</i>	

Special mention was also made of the fact that this year was also Dr. Harry Oberhelman’s 50th Anniversary on the staff at SHC – a remarkable accomplishment.

Also highlighted were the most recent recipients of three major awards that recognize excellence in patient care and compassion. Two of these are SHC Awards and one is a School of Medicine Award – and they all focus on clinical excellence. They include:

1. Denise O’Leary Award for Clinical Excellence

- a. 2010: Dr. Robert Dodd, MD, PhD
- b. 2009: Dr. Christine Wijman, MD, PhD

2. Isaac Stein Award for Compassionate Care

- a. 2010: Timothy Chamberlain
- b. 2009: Stephanie Harman, MD

3. Alwin C-Rambar-James BD Mark Award for Clinical Excellence

- a. 2010: Philip Sunshine, MD
- b. 2009: David Stevenson, MD

Of course, in addition to the recognition of outstanding clinicians at Stanford, the focus of the evening was dinner and dancing! I must admit that I’d much rather run than dance (and for good reasons) but fate intervened (although many would note that my versions of dancing and running are not readily distinguishable).

I want to thank Bryan Bohman and Ann Weinacker for arranging the Gala and the many individuals who worked so hard to make it a special event. Given the many pressures and demands we all face every day, it was great to have an opportunity to interact with old and new colleagues in a non-clinical (and very lovely) setting.

2011 Medical Students Research Awards

On May 19th the Stanford University Medical Center Alumni Association hosted an event to honor the five medical students whose research project was selected for special recognition at the 2011 Medical Student Research Symposium. This marks the 28th anniversary of this research symposium, which features the work of student projects performed through Medical Scholars Program, Scholarly Concentrations, MSTP and other programs. We are fortunate to have students who are committed to conducting excellent research in a wide variety of areas and topics.

The 2011 Award Winners are:

- **Shah Ali, SMS 3:** *Direct Evidence of Postnatal Cardiomyocyte Generation on Murine Models of Aging and Cardiac Injury.* Dr. Irv Weissman is his mentor.
- **Dhruvatej Boddupalli, SMS 3:** *One breath: A Low Cost Ventilator for Pandemic Preparation and the Developing World.* Dr. Tom Krummel is his mentor.
- **Tyler Johnston, SMS 2:** *Biomechanical Evaluation of a Novel Reverse Coracoclavicular Ligament Reconstruction for Acromioclavicular Joint Separation.* Dr. Tim McAdams is his mentor.
- **Patrick Lin, SMS 4:** *Molecular Inversion Probes (MIP) Identify Novel Genomic Signatures in Pediatric Low Grade Gliomas.* Drs James Ford and Joshua Schiffman are his mentors.
- **Felipe Perez, SMS 2:** *Characterizing the No Show Patient at Lucile Packard Children's Hospital.* Dr. Corinna Haberland served as his mentor.

The 2011 Research Symposium Judges included a broad array of faculty, students and staff, and I want to thank them and congratulate our students. I also congratulate and thank all of our students who are pursuing research projects as an integral part of their medical education.

Awards and Honors

- **Dr. James Chang**, Professor of Plastic and Reconstructive Surgery and of Orthopaedic Surgery and Chief of the Division of Plastic Surgery in the Department of Surgery, is the recipient of the 12th Annual Stanford Asian American Award for Faculty.
- **The School of Medicine BioAIMS (Biomedical Association for the Interest of Minority Students)** has been named the recipient of the President's Award for Excellence Through Diversity. This student led organization promotes diversity for graduate students at Stanford and offers numerous programs to help support students and their families. This year's president of BioAIMS is Antonia Dominquez from the Department of Genetics. Please join me in congratulating the BioAIMS students, leaders and staff for this wonderful recognition. A reception will be held on Monday June 6th from 3:4:30 in the Citrus Courtyard between Building 10 and the History Corner.
- **Scope**, the School of Medicine's blog, has received a Bronze award in the blog category from the Health Information Resource Center. Now in their 13th year, these awards were created to "recognize high-quality electronic health information."

Congratulations to all.

Appointments and Promotions

Jonathan Bernstein has been reappointed to Clinical Assistant Professor of Pediatrics, effective 7/1/2011.

David Clarke has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2010.

Robert P. Cowan has been appointed to Clinical Professor of Neurology and Neurological Sciences and, by courtesy, of Anesthesia, effective July 16, 2011.

Brittney DeClerck has been appointed to Clinical Assistant Professor of Pathology, effective 11/1/2011.

Lyn Dos Santos has been promoted to Clinical Associate Professor of Pediatrics, effective 5/1/2011.

Laleh Gharahbaghian has been promoted to Clinical Assistant Professor of Surgery, effective 7/1/2011.

David Goya has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2010.

Christine C. Gray has been appointed to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 5/1/2011.

Amy Heerema-McKenney has been promoted to Clinical Associate Professor of Pathology, effective 5/1/2011.

Irene Oi Yin Ho has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 4/1/2011.

Manuela M. Kogon has been appointed to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 5/1/2011.

Erik T. Price has been reappointed to Clinical Assistant Professor of Medicine, effective 3/1/2011.

Karla K. Prodany has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 4/1/2011.

Dana N. Romalis has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 5/1/2011.

Alan Spira has been appointed to Clinical Associate Professor (Affiliated) of Medicine, effective 4/1/2011.

Sarah R. Williams has been promoted to Clinical Associate Professor of Surgery, effective 9/1/2011.

Gail Wright has been promoted to Clinical Associate Professor of Pediatrics, effective 4/1/2011.

Dean's Newsletter

June 13, 2011

Commencement 2011

We celebrated the School of Medicine and Stanford University Commencement on June 11-12th. This year advanced degrees were awarded to 261 School of Medicine students, including 39 Master of Science Degrees, 126 Doctor of Philosophy Degrees and 96 Doctor of Medicine Degrees. A number of students were the recipients of one or more advanced degrees – some awarded concurrently this year and others sequentially over past years. This was the first year we held commencement on Alumni Green, facing the Clark Center, Fairchild Science, the Li Ka Shing Center for Learning and Knowledge, the Beckman Center and the Lorry Lokey Stem Cell Research Building and proximate to the new Science and Engineering Quad and to our main teaching hospitals, Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. This contiguous alignment of research, education and patient care on the campus of a major university is one of the unique features of Stanford Medicine. But what really differentiates us is the quality of our students, trainees and faculty – and commencement is an opportunity to recognize and celebrate the incredible accomplishments of our students. They offer hope at a time of tremendous changes in our healthcare and research landscapes.

Commencement is also an opportunity to recognize and celebrate the contributions of our students and trainees to teaching and learning. We are the beneficiaries of shared learning opportunities as well the creators of new knowledge. This interface is also an essential component of the distinguishing culture that defines Stanford.

I want to thank the many dedicated individuals who organized the Commencement events and staffed them with such a high degree of professionalism and excellence, especially Zera Murphy, Director for Student Life, and her team of volunteers who gave up part of their Saturday to lend a hand. I appreciate all their efforts.

Nearly a third of the students receiving the Doctor of Medicine degree will continue their training at Stanford. Overall, while students will relocate to 14 states, nearly 80% will continue

their training in California, Massachusetts, New York, Washington or Maryland (http://deansnewsletter.stanford.edu/archive/03_21_11.html). In celebrating our students who will be continuing their lives in science, medicine and other important ventures, we also remembered with deep respect Emma Bakes, who would have received her MD degree on June 11th but who, tragically, died of cancer on February 28th. Emma came to Stanford Medical School following a distinguished career as an astrophysicist and with a deep passion to become a doctor. Sadly, Emma's greatest lessons about medicine came from being a patient – but she inspired all whom she met and her memory will live on through the Emma Bakes Scholarship. Since she completed all of her requirements for graduation, we awarded her MD degree in her memory and for her family and friends (also see: http://deansnewsletter.stanford.edu/archive/03_21_11.html).

Student Speeches

A tradition at the School of Medicine Commencement is to hear comments from a graduating PhD and MD student who has been elected by his or her classmates. I am pleased to share their comments with you:

Remarks from Graduate Student Speaker - Joel Dudley, PhD Candidate in Bioinformatics

First of all, allow me to thank my fellow classmates for electing me to speak today, and also thanks to Zera Murphy, Dean Pizzo and many others who have worked hard to make it possible to celebrate this commencement today.

When I sat down to write this speech, I was feeling a bit daunted, so I began reading biographies of some of the notable graduate students from Stanford's history. I started reading about people like Larry Page and Sergey Brin who founded Google, and Jerry Yang and David Filo who founded Yahoo! Then I realized that these guys all started billion dollar, world-changing companies before they ever finished graduate school. And then I thought, wow, maybe I've actually failed somehow because I ended up making it to graduation without starting a world-changing company. So, I stopped doing that, because it was getting a bit depressing to be honest. Then I thought, hey, I'm an informatics guy, I should be able to write a computer program that will write the speech for me. So I put together some software that would try to extract the essence of commencement speech text and first fed it the commencement address text from (a well-known public figure).

So then thought to myself, very simply, "what does it mean to obtain a graduate degree from Stanford?" So, we are all walking away with MDs, PhDs, and masters degrees, good for us, but these degrees can be obtained at countless institutions across the country. Does it mean anything that we are getting our degrees from Stanford in particular, and if so, what? Now, we all know intuitively that Stanford is a unique place, and that there is no other university like it. But I think you'll all also agree that this is a very difficult understanding to put into words. Then it hit me when I was reading books to my son one night. I happened to be reading one of the Harry Potter novels to my son when it struck me that Stanford is our real-world Hogwarts School. Many of you probably know that Hogwarts is the magical place in the world of Harry Potter where all the wizards go to school. Now, I'm not saying that Stanford is like Hogwarts because we also have a

bunch of young wizards roaming the halls, which we do. Rather, Stanford is just like Hogwarts because the extraordinary is ordinary. For those of you who have read the books or seen the movies, you know that at Hogwarts School, the paintings move around and talk, the staircases are constantly flipping around the school, and other little bits of magic are part of the ordinary day-to-day life in the school. Now Stanford is exactly the same in that there are extraordinary magical things happening here on a day-to-day basis that are just part of the everyday experience at Stanford.

Here at Stanford it is ordinary for an MD and an engineering student to take classes together in the Stanford design school and work side-by-side on the next generation of innovative healthcare projects. At Stanford it was ordinary to see iPads in the hands of patients and doctors mere weeks after they became available. At Stanford it is ordinary for bioscience med students to take entrepreneurship courses taught by VCs to help them take their ideas and innovations to market. At Stanford it is ordinary for MD and PhD students to take a course that lets them get hands on experience hacking their own personal genomes, or to get hands on experience making induced pluripotent stem cells when the rest of the medical world is still trying to learn what these things even mean. At Stanford it is ordinary for students to write their own iPhone apps to make their research easier, or for pediatricians to collaborate with computer science professors to hook next generation artificial intelligence algorithms to pediatric ICU equipment to realize the future of data-driven healthcare. I'm sure that given the time, many of you could come up with numerous more examples of this kind of magic that is part of the everyday life at Stanford, and I think that we can all agree based on our own personal experiences, that the extraordinary is ordinary here at Stanford in that we are creating and working in the future of science and medicine here on a daily basis.

The science fiction author William Gibson once said, "The future is here. It just isn't evenly distributed." Since we have been living the future of scientific research and healthcare throughout our training here at Stanford, I believe it is our responsibility, as fresh graduates of this unique environment, to distribute this future to the rest of the world. Now I don't think it's news to everyone here that our country and our world is in a bit of a slump. The entire country is looking for the next wellspring of innovation that is going to pull us out of this economic slump into another wave of prosperity. Do you think they are looking at the east coast, at Wall Street to pull us out of this slump? I don't think so. I can tell you that the whole country, maybe the whole world is looking west to Silicon Valley for the next wave of innovation. And many of you know that Stanford and its professors and graduates are at the heart of innovation here in Silicon Valley. Some of you may recall that a few months ago President Obama came to visit this area and he landed his Marine One helicopter directly on Stanford Campus soil. I think there was a lot of symbolism to that gesture. I don't think he landed his helicopters on our campus as a matter of convenience. Let's face it, SFO is only 30 minutes away and the heavily-guarded NASA Ames research center airstrip is just 15 minutes away. No, I think the President himself was making it clear that he has high hope for the continued innovation capacity of Stanford to drive us out of this rough patch.

In a way I'm somewhat sorry to conclude that just when you thought you were graduating and could ride the prowess of the Stanford name into a cozy perch in the working world, that our Stanford degrees carry a tremendous responsibility. It is not possible for you to get your next job and sit back and relax and think, "Well, I'm just going to run with the pack here and hope that

someone does something to fix this economy." You have to realize that we are critical players in the future of this country and this world because nobody has been trained like us. Because you have been here at Stanford so long, you likely take all the extraordinary aspects of your training for granted. But I'm telling you that once you get out into the wild of the "real world" you will very quickly realize how special your training has been. Therefore it is imperative that we rise to the occasion and push to realize the full potential of our training. I know that you can do it. And how do I know? Because that's exactly what every Stanford Medical School graduate has done before us. Just spend a few minutes on Wikipedia reading about our predecessors and you will be in awe of the legacy that is ours to maintain.

Remarks from Medical Student Speaker - David Craig

It is my unbelievable honor to be speaking to the 2011 graduating class of the Stanford University School of Medicine. A class of intelligence, compassion, extreme good looks. And now, a class of doctors. And, lest we forget, we are an historic class at Stanford: the final class to graduate without having passed even one course in a distinguished manner. Graduates of 2011, hold your heads high, for we were the straw that finally broke the camel's gradeless back; the class that found the thin line between pass and fail and deeply explored its meaning. Although, in truth, none of you ever needed a mark, good or bad, to motivate you; you are people whose native passion and internal motivation will always far outstrip the reach of any red pen. We are these people. And when the administration of this world class medical institution asked us to help shape the new grading system, to provide feedback and assistance from a student perspective, we responded like the most noble of creatures in a structure fire: by getting the hell out of the building.

Which is why we are all sitting here today, preparing to go from the frying pan of medical school to the ...armageddon of residency. And if you remember the commotion about the rapture a few weeks ago, well, it turns out that they just got the date wrong: a correct reading of all major religious texts predicts a yearly bump in the number of souls on the way to heaven every July 1st. But don't worry, you won't be going anywhere when it happens: you will be on call. They say that when a new doctor is made, an angel gets its wings, and now that I see just exactly what we know at the end of medical school, I realize that the phrase is meant literally.

Indeed, we are headed far and wide next year, the newest foot soldiers in the war against disease that leaves not one of us on this planet untouched, a true world war in a pure and timeless sense. And my classmates, though your staggering debt load may prevent you from sleeping on an actual bed, you can at least sleep soundly knowing that you have chosen to fight on the right side of this war. We all know that there is profit to be made, quickly and in abundance, in spreading fear and ignorance, in promoting poor health, in disregarding or denying the sorrow of another human being. You have instead chosen to hold a candle against these things, to enter into a profession where even your daily commute is a statement against suffering and a habitual reaffirmation that good exists. And believe me, this is the only way that a rusted 1993 Geo Metro driving at 6 am will ever be considered a sign of good in the world.

As interns, you will not set all of the care plans, but you will be the constant presence at the bedside, the face that appears in a patient's mind when they wake up at 2 am in pain and in need of "their doctor." In this part of the war against illness, you will be the pointy tip of the Foley, the first to respond and uh...relieve the situation. It will be on you to show up, maybe tired, maybe

frustrated after a long day, at 2:05 am and bring to bear your skill and above all your compassion, from trench to bedside.

You are an amazing and accomplished group of colleagues, and it would take me all day to list even those of your achievements that I know off the top of my head. But we did not get here alone; we were supported, mentored, guided. We had help. From family, friends, teachers, patients. Innumerable people chipped in and sacrificed so that we might develop, some in ways that we will never fully comprehend or possibly even realize, and we would be remiss not to spend some time thanking them. With that in mind, here we go...thanks.

It is actually a peculiar deficiency in our language that we only have the word "thanks" to express gratitude. "Thanks" is what you say to the guy who made your coffee; "thanks" is what you say when somebody holds a door. What do you say, then, to somebody who has, for decades, given variously of their body, their career, their savings, their thoughts, and above all of their time to you? What do you say when, to your shame, you were sometimes less than grateful for these indescribable gifts, when they had to be given out of nothing but faith, determination, and a transcending love that has inspired some of the best literature and worst tattoos in the history of our species? I guarantee you that there is not a person in a robe here today who is not thinking about their parents, biological or otherwise, and I also guarantee you that we don't know what to say. It certainly is not just "thanks." Personally, I can only think to express my gratitude in the way that I always have and will always in the future: by calling home once every two weeks and asking how the cat is doing.

Our advisors. Drs. Blaschke, Knox, Salvatierra, and Gesundheit. To say that you tolerated our harebrained ideas and rants is both selling you short and seriously underestimating the intelligence of a hare. Thank you.

Our medical administration and deans. While we may not have always agreed on policy, your doors were always open, and working with you was always a tremendous privilege, both when the white coats were off and especially when they were on. In a world where people are often content to ignore you if not work intentionally against your best interests, I have never doubted that you had ours in mind constantly. You are role models for ascetic, civic-minded self-sacrifice, to the degree that, should I ever be in a position of leadership in the future, I hope dearly that I will prove far more effective than all of you at using my power to enrich and glorify myself. You have a strong and definite vision for the future of medical education, bringing us both an innovative new clinical evaluation system called "grades" and a beautiful new building full of equipment so expensive that experts estimate its sale at auction would generate enough money to pay up to half of one student's medical tuition next year.

You have given us other bold new programs, too, such as Educators4Care. An initiative that has identified some of the most skilled and dignified physician educators in our institution and put them to work for a project whose name is based on a number pun. In its naming, Educators4Care finally elevates Stanford to the lofty ranks inhabited by such cultural institutions as the musicians of 2 Live Crew, the videogame Left 4 Dead, and of course the 2003 cinematic masterpiece featuring Ludacris, 2 Fast 2 Furious. Thank you for that.

And for the future, you have ensured that we will never forget medical education, largely because you have ensured that we will be paying for ours until the heat death of the universe, when physicists tell us that all motion and life will stop, but several government loan agencies remind us that we will still be responsible for all of our borrowed money. Interestingly, the idea of free medical education has become more trendy recently. I think that this is a fantastic idea, but I will block it with my life if its provisions are not also retroactive. And don't worry, deans, I

mean that for you, too. I will see to it personally that you are fully refunded the three-hundred dollars that you paid directly to Dr. Osler himself for your medical educations in the time before the great flood.

At this point, I should note that I thought that I would be receiving my diploma before this speech.

And so we transition. My classmates, Stanford made us colleagues, but we made ourselves friends. And if ever you become nostalgic and miss the last four to eleven years of your life, you need only to load an online medical lecture at 200% of the normal speed, and you will be home again. But still it is with a huge amount of sadness that I watch all of you ready to disperse; we have just barely become doctors, and already we're itching to leave the room too fast. You're set to go to so many amazing and influential cities, such as Boston, New York, Los Angeles, and...other. And undoubtedly you will make a difference for the better in innumerable lives, as I know you already have. In truth, after spending the last several years with you, I can say honestly that medical school has only made you doctors in the way that a microphone makes somebody a singer. The letters "MD" will magnify your impact and open doors for you, will let you reach into more and darker corners of the world and spread hope and comfort there. That is true. However, those letters work only like a microphone, only amplifying what you put into them. And a microphone will never make you a singer, just as an MD will never make you a doctor. It is now just as it has always been: you have to bring your own voice, and it is, in the end, the only thing that matters.

I'd like to close now by ripping off a more experienced speaker. Everybody here who is affiliated with Stanford medicine knows that our community suffered an unfathomable loss this year with the death of Dr. Gregory Feldman, a surgeon and teacher whose profound, protean talent was matched only by the degree to which he was beloved. I know for a fact that his influence directed many of the graduates here today, and he is and always will be instantly and permanently missed. What you may not realize, however, is that some years ago, Dr. Feldman gave a commencement address for his graduating class at some medical school in Boston that I have never heard of. And this speech was so good that it ended up on youtube, where I will be stealing from it for the rest of my life. Birthdays, bar mitzvahs, my own wedding vows, all of it. I'd like to end now as he ended then:

"In medicine, as in life, it's far more important to be lucky than to be good. My friends and classmates, we've spent the last 4, 5, or in some cases, 37 years of our lives studying to get good, and not one of us graduating today can effectively treat lower back pain. So as we move forward into our residencies, let us resolve to take the focus off getting good and concentrate instead on getting lucky. Thank you."

Commencement Address by Dr. Elizabeth Blackburn

We were very fortunate to have Dr. Elizabeth Blackburn as our 2011 School of Medicine Commencement Speaker. Dr. Blackburn is the Morris Herzstein Professor of Biology and Physiology in the Department of Biochemistry and Biophysics at UCSF, where she has been on the faculty since 1990. Dr. Blackburn earned her undergraduate degrees at the University of Melbourne and then did her PhD at Cambridge. Her contributions to science have been extraordinary – especially her elucidation of the molecular nature of telomeres (the protective caps at the ends of chromosomes) and the ribonucleoprotein telomerase – work which earned her

the 2009 Nobel Prize. In addition to being an incredible scientist, Dr. Blackburn is a courageous advocate for ethical principles and justice, as was shown by her decisions on the importance of stem cell research. She is deeply admired by the national and international scientific community and stands as a role model of excellence.

First and foremost, warm congratulations to all you Graduates -- this is truly YOUR day -- and congratulations to those who have helped make this day possible -- your families, your teachers and friends who are here celebrating this significant day with you.

Thank you so very much, Dean Pizzo, honored guests, ladies and gentlemen -- and most importantly! Graduates -- for inviting me to this very special occasion today.

A scientific heroine of mine, the great physicist and chemist Marie Curie, who won a Nobel prize two times, said something that struck me: "Nothing in life is to be feared. It is only to be understood."

This quote resonated with me and I hope it will with you too. I think it has meaning in ways relevant to you today.

First, as you go through the often unfamiliar territories that the journey of your life and career will take you on;

And second, as we consider where medicine and biological and biomedical research may go, with all the advances in knowledge in these areas that have happened and that will be happening. First, the unknown directions of one's life. As I began my journey into biological sciences research and now, as I encounter issues of medicine and society arising from that research, surely those words of Marie Curie "Nothing in life is to be feared. It is only to be understood" have been applicable. Although, I don't think my mother would have exactly appreciated them way back when my journey began, far away in Tasmania, Australia: as a small child living near the seashore I had the spine-chilling habit of picking up dangerous animals - poisonous jellyfish from the beach and stinging ants from twigs - and singing and crooning to them -- behavior I thought perfectly natural, because I loved animals, but which was probably not good for the peace of mind of parents. So I think my mother would have appreciated me having a little more fear then!

I was lucky to be given the circumstances in life that could transmute that childhood enthusiasm into a lifelong passion for doing science. These circumstances included the opportunity to have a great education, as you graduates have had here at Stanford. But more importantly, to have the opportunity to join something much bigger than myself -- I mean here the great enterprise of biological and biomedical research. It was a huge privilege to become a part of a tradition of learning and scholarship and to become an active contributor to the surge and excitement that exist in the quest for discovery in science and medicine. So how do Marie Curie's words "Nothing in life is to be feared, it is only to be understood" apply here?

Well, the paths many of you will choose after your graduation will be demanding. As has been my experience, throughout your lives and careers you are going to have to encounter the new and unfamiliar, which can engender fear. Specifically, the many profound triumphs of medicine and biological research to date now confront us with a myriad of completely new challenges. So, instead of sticking with what worked in the past, one will have to fearlessly open one's mind to new ways of thinking and approaches.

My own path in biology has allowed me to experience this in various ways. First, for my research that led to our discovering the molecular nature of chromosome ends, and to the discovery of the enzyme, telomerase, that maintains these ends -- we had the freedom - the

sometimes scary freedom - to do novel experiments, that sometimes necessitated stepping into byways away from the mainstream of research. For biology often reveals its general principles through what may seem at first to be arcane and bizarre. Specifically, we studied obscure, harmless, tiny single celled creatures in pond scum, called Tetrahymena. - Tetrahymena even have not two, but seven sexes -- reminding us that there is more going on below the calm surface of ponds than we might think! Why did we study such exotic-seeming creatures? Because they have many, many short, linear chromosomes, making them perfect for molecular studies of chromosome ends, and I was curious about a mystery of nature: how are the ends of chromosomal DNAs replicated without losing terminal DNA sequences?

Well, this tiny organism - certainly not a household name, or mainstream - enabled me to find out the molecular nature of chromosome ends -- call telomeres - and we discovered that without the special telomeric DNA and its unique mode of replicating, chromosome ends gradually shorten as their telomeric DNA erodes away, eventually causing cells stop dividing altogether. This might have seemed on the surface obscure. So why did it matter? Well, these protective chromosome caps, the telomeres can wear down -- shorten - with age in people, and short telomeres signal cell death. Thus if telomeres shorten the cells lose the ability to self renew, or even become genetically unstable. And, chromosome ends often wear down as we age.

And this leads to the second reason Marie Curie's words "Nothing in life is to be feared; it is only to be understood" resonates with me, and I hope will with you too. This reason relates to where medicine and biomedical research may go. Because, unexpectedly, our research work has led me, and many others, into questions of human diseases, such as cancer.

From the work of many groups worldwide, including, I am proud to say, ours, it is now emerging that telomeres and their maintenance are relevant to at least one aspect of an age-old question that humans have been asking for millenia: how do we age?

Now, while aging is of course a many-faceted process, one unwelcome fact about it for humans is increased susceptibility to the diseases of aging -- cancer, heart diseases, diabetes, etc.

Emerging evidence is linking inadequate telomere maintenance - that is, the wearing down with age of the protective caps at the ends of chromosomes - to this facet of aging. What contributes to inadequate telomere maintenance and, perhaps in turn, to diseases of aging? Genetic factors, yes, and non-genetic factors, and combined interactions of genetic and non genetic influences. Indeed, in recent years, much research links this once only basic research into chromosome end maintenance to some of the commonest diseases of aging in people, to how peoples' health is impacted as they age, even by such factors as chronic, debilitating psychological stress, which can affect aging processes occurring at the very heart of our bodies' cells. Chronic psychological stress is a major part of modern life. So, our work even leads into the age old search for a deeper understanding of the mind-body connection, including how stress, feelings and thoughts, can affect health.

Our research has played right into these larger questions, presenting yet another new challenge: can this, originally lab-based, understanding of telomeres and telomerase be exploited in the quest to intercept or even prevent the now-common chronic diseases in society and improve health?

Freshly graduating from Stanford's School of Medicine, you have learned that major triumphs of 20th Century research and medicine have prominently included learning how to specifically diagnose and treat diseases. Beginning with gaining morphological understanding of disease states, more and more this success is now coming from cellular/molecular understanding of evolving disease processes. Ironically, it is these truly amazing triumphs - in understanding,

treating or curing so many severe diseases and afflictions -- that have brought the more delayed, slowly developing common diseases of in our societies - such as cancer, heart disease, diabetes - to the fore as looming medical challenges.

And the understanding of disease processes is now putting into our sights a wonderful goal: the prediction of disease risks, permitting less toxic and more effective interventions. Often, modern medicine necessarily emphasizes treatment AFTER symptoms arise and normal function is compromised. Ideally, we would intervene before symptoms appear, and thus preserve normal function. A great goal would be the ability to prevent or intercept these common diseases, with preservation of health at a population scale. And for these challenges we may need new approaches in medicine, and indeed in society.

I was not ever trained as a physician. But from asking basic questions about how cells work, and then later, by teaming up with wonderful clinical and other collaborators, we have gone into unexpected realms and made unanticipated findings, which perhaps may even help us do useful things for human health in the future. I've now become very interested in challenges and ramifications of medicine in the modern world -- this was not an expected direction of my journey in research, so I have had to keep relearning new aspects of research through my professional life. So never be afraid of the new, as one cannot tell where your career might lead. I hope that this story has illustrated that a journey in biomedical research can take unexpected turns and one always is learning. I want to emphasize how rewarding intense work can be: to wake up every morning excited about the work, and to feel it is worthwhile and important. So lastly, I want to touch on the question of balance in life. I have found great happiness in the excitement and, yes, the fun of being part of something much larger than oneself: this quest to understand how life works and now its implications for human health.

Now, we sometimes think of balance as meaning having each day on some kind of normal schedule. But it is important not to lose the intensity of involvement needed to achieve significant work that you think is important. For me, rather, I think balance in life can be achieved over years, rather than on some daily or weekly basis. For some years I was completely absorbed in research. Later in my life, I joined into the mainstream of life and its complexities -- it was a great joy to my husband and me when our son was born and having family life -- making work and family scheduling complex of course! Later, in a different kind of balance, I began thinking about larger issues of the impact of biological and medical research in society, which brought me into arenas of national science policy and thinking about social justice. These have all been great adventures and now having received the Nobel Prize there are yet again some unexpected new adventures and experiences: For example: people sometimes come up and say "Can I touch you?" So I would urge you never be afraid of the new, remembering Marie Curie's words.

What I have learned that I'd like to pass on to you? Go on your future journeys never fearing, but trying to understand. I have learned that a pursuit of something larger than myself is perhaps the most important thing one can do with one's education. So join something larger than oneself and use your education and training to benefit as many people as possible.

Thank you and congratulations, graduates.

Teaching Awards to Faculty and Residents

On June 1st we hosted the Annual Student Clinician Ceremony, honoring teaching and humanism in medicine. We celebrated medical students who completed their preclinical education and who

are about to embark on their personal journey into clinical medicine. We also honored medical students who were being inducted into the Arnold P. Gold's Humanism Honor Society. In addition we recognized Residents at Stanford Hospital & Clinics and the Lucile Packard Children's Hospitals who were being honored by the Arthur P. Gold Foundation and Excellence in Teaching. And finally we recognized the faculty who were receiving awards for their excellence in preclinical and clinical teaching as well as in undergraduate education. Accordingly, this wonderful event brought together a community and continuum of teachers and learners from medical students to residents to fellows. Most importantly, the ceremony recognized the important links between medicine and humanism and between education and professionalism. Listed below are the various award recipients – who were also featured at Commencement.

Faculty Award for Teaching

Miriam Goodman, PhD, *Associate Professor, Department of Molecular and Cellular Physiology*

Faculty Award for Student Service

Olivia Martinez, PhD, *Professor, Department of Surgery (Immunology)*

The Arthur L Bloomfield Award In Recognition of Excellence in the Teaching of Clinical Medicine

Neera Ahuja, MD, *Clinical Associate Professor, Department of Medicine - General Internal Medicine*

Jeffrey Dunn, MD, *Clinical Associate Professor, Department of Neurology*

Jose Montoya, MD, *Associate Professor, Department of Medicine (Infectious Diseases)*

The Henry J Kaiser Family Foundation Award for Outstanding and Innovative Contributions to Medical Education

Andrew Connolly, MD, *Associate Professor, Department of Pathology*

The Henry J Kaiser Family Foundation Award for Excellence in Preclinical Teaching

Kathleen Gutierrez, MD, *Associate Professor, Department of Pediatrics (Infectious Diseases)*

Beth Martin, MD, *Clinical Assistant Professor, Department of Medicine (Hematology)*

Shefali Srivastava, MD, *Clinical Instructor, Department of Psychiatry and Behavioral Sciences*

The Henry J Kaiser Family Foundation Award for Excellence in Clinical Teaching

Jason Lee, MD, *Assistant Professor, Department of Surgery – Vascular Surgery*

John Morton, MD, *Associate Professor, Department of Surgery – General Surgery*

Eva Weinlander, MD, *Clinical Associate Professor, Department of Medicine – Family and Community Medicine*

The Franklin G Ebaugh, Jr. Award for Advising Medical Students

Karen Friday, MD, *Clinical Professor, Department of Medicine*

The Alwin C Rambar-James B D Mark Award for Excellence in Patient Care

Jeffrey A Norton, MD – *Professor in Surgery, Chief, Surgical Oncology and General Surgery, Department of Surgery*

Lawrence H Mathers Award for Exceptional Commitment to Teaching and Active Involvement in Medical Student Education

Lars Osterberg, MD, *Clinical Associate Professor, Department of Medicine – General Internal Medicine*

Allan V Cox Medal for Faculty Excellence Fostering Undergraduate Research

Garry Gold, MD, *Associate Professor, Department of Radiology – Diagnostic Radiology*

The Arnold P Gold Foundation Award for Humanism and Excellence in Teaching by Residents

Erin Augustine, *Pediatrics – General Pediatrics*

Jason Bartos, *Medicine – General Internal Medicine*

Judith Hagedorn, *Urology*

Ronald Jou, *Surgery*

Zachary Kastenber, *Surgery*

Joy Rusmintratip, *Psychiatry and Behavioral Sciences*

Gold Humanism Honor Society 2011 Inductees

Omar Amir, SMS 3

Patrick Avila, SMS 3

Krista Birnie, SMS 3

Blake Charlton, SMS 4

Ian Corcoran-Schwartz, SMS 3

Matthew Goldstein, SMS 6+

Richard Jones, SMS 3

Eric Leroux, SMS 3

Danica Lomeli, SMS 3

Long Nguyen, SMS 3

Keyan Salari, SMS 6+

Amanda Schwartz, SMS 3

Krishnan Subrahmanian, SMS 3

Rachel Sussman, SMS 3

Morgan Theis, SMS 3

Jane Whitney, SMS 3

Please join me in congratulating this exceptional group of students, residents and faculty for their teaching and humanism.

Update on the Center for Clinical Informatics

At a recent Executive Committee meeting Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology gave an update on the Stanford Center for Clinical Informatics. He subsequently prepared a summary of his presentation which I am pleased to share with you below:

The Stanford Center for Clinical Informatics was established in 2005 as one of three Strategic Centers at the School of Medicine. The Center is directed by Henry Lowe MD, Associate Professor of Pediatrics and Senior Associate Dean for Information Resource and Technology (IRT). The discipline of Clinical Informatics has been defined as transforming health care by "analyzing, designing, implementing, and evaluating information and communication systems that enhance individual and population health outcomes, improve patient care, and strengthen the clinician-patient relationship." (Gardner RM et al. Core Content for the Subspecialty of Clinical Informatics. J Am Med Inform Assoc. 2009 Mar-Apr;16(2):153-7). The Center for Clinical Informatics defines its mission as "fostering the use of innovative information technology solutions to improve human health." Given the research-intensive nature of Stanford University School of Medicine, a major focus of the Center's activities to date has been applying Informatics expertise and technologies to support the School's clinical and translational research mission. In this regard, the Center works in partnership with SPECTRUM, the coordinating entity for Stanford University's Clinical and Translational Science Award (CTSA) grant, on three overarching goals:

1. The application of innovative informatics to reduce barriers to effective clinical and translational research (CTR)
2. Connecting the Stanford CTR community to data, technology and expertise through a free Informatics consultation service
3. Using the Stanford CTR community's needs to drive innovative applied Clinical Informatics research and development projects

The Center's Clinical Informatics consultation service, staffed by an experienced team of informaticians, computer scientists and analysts, provides up to five hours of assistance at no charge. In 2010 the Center handled over 200 substantial consultations (out of a total of over 300 requests), a 70% increase over 2009. Most of the consultations fell into two categories: secondary use of health information for research purposes and provision of secure research data management solutions. The Center's impact is increasingly broad, in 2010 working with faculty in almost all of the School's clinical departments and a number of the basic science departments.

A major contributor to the Center's success has been the STRIDE (Stanford Translational Research Integrated Database Environment) system. This secure informatics platform, developed by the Center, provides critical functionality in three area:

- In partnership with both hospitals, STRIDE aggregates information from the Stanford pediatric and adult electronic health records using a HIPAA-compliant model that facilitates the secondary use of health information for a wide variety of research activities. The STRIDE Clinical Data Warehouse integrates clinical data on almost 1.65 million pediatric and adult patients cared for at Stanford since 1995. STRIDE offers powerful, HIPAA-compliant, "self-service" tools that allow researchers to identify potential research cohorts using clinical and temporal criteria as well as performing

efficient, secure, electronic review of clinical data to further refine patient cohorts. The Center also extracts and models clinical data sets for use in IRB-approved research studies. A recent addition to the STRIDE platform has been a novel Research Alerting System that analyzes clinical data in real-time to provide secure notification of potential research participants. The STRIDE platform is also being used to provide reports based on clinical data as part of Stanford Hospital and Clinics' quality improvement initiative.

- STRIDE provides a secure, HIPAA-compliant platform for the deployment of sophisticated research data management applications. A number of these STRIDE applications have been deployed, supporting a diverse set of research activities including Cancer Genetics, Joint Replacement Registries, Cardiothoracic Surgery Outcomes, Multimedia Dermatology Research, Neonatology Data Linkage and a joint breast cancer outcomes project involving Stanford and the Palo Alto Medical Foundation (PAMF).
- Biospecimen data management (specimen registration, tracking, retrieval and linkage to clinical data) is provided by STRIDE to a number of tissue banks, including the Stanford Cancer Institute (in partnership with the Department of Pathology), Bone Marrow Transplantation and Hematology. STRIDE manages and tracks information on over 100,000 biospecimens stored at Stanford.

In addition to STRIDE, the Center also operates an installation of REDCap (Research Electronic Data CAPture), a secure web-based research data management system developed at Vanderbilt University and supported by a consortium of 200 global partners (including the Center). This easy to use, self-service system is provided free of charge by the Center and integrates with many data analysis tools. The Center currently hosts over 200 active REDCap research databases, with approximately 500 active users at Stanford. REDCap databases are secure, backed-up and address the risk of storing sensitive clinical research data on the user's computer.

The Center for Clinical Informatics has a number of ongoing research and development collaborations with groups across the School, including Biomedical Informatics (clinical data mining, multisite secure clinical data exchange, algorithmic clinical data modeling, similarity matching algorithms), the Cancer Center (breast cancer outcomes, cancer center research database), Anesthesia (sepsis identification, research registry frameworks), Emergency Medicine (research alerting), Cardiothoracic Surgery (integrated databases for outcomes research), Dermatology (drug prescribing patterns), Genetics (Personalized Medicine), Neonatology (High Risk Infant Registry) and the Stanford Prematurity Center (Integrated Database Models). The Center has also engaged in a variety of educational activities, including a very successful Clinical Informatics seminar series and providing clinical informatics research training opportunities to masters and doctoral students, in partnership with the Stanford Biomedical Informatics Training IDP.

Looking forward, in addition to continuing many of its current activities, the Center sees exciting opportunities for research collaborations in new areas such as large scale clinical data mining, clinical text mining, quality improvement and outcomes, novel data-driven clinical decision support and personalized medicine applications that leverage on the integration of clinical and genomic data. More information about the Stanford Center for Clinical Informatics' activities and services are available at <https://clinicalinformatics.stanford.edu/>

Upcoming Event:

Stanford Health Policy Forum: The State of Children's Health in California - with Diana Dooley, California Secretary of Health and Human Services

Monday, June 20

12:00 – 1:30 PM

Clark Center Auditorium

The panel at the Stanford Health Policy Forum on June 20th will include California Health and Human Services Diana Dooley, Lucile Packard Children's Hospital President and CEO Christopher Dawes and Stanford faculty members, Dr. Shashank Joshi and Dr. Paul Wise. Paul Costello, Executive Director of the Office of Communication and Public Affairs, will lead a roundtable question and answer discussion -- first with the guest speakers and then with the audience. Additional information is available at: <http://healthpolicyforum.stanford.edu/>

Other Awards and Honors

- **Paul C. Blainey, PhD**, postdoctoral fellow, Bioengineering, has received the 2011 Career Award at the Scientific Interface by the Burroughs Wellcome Fund.
- **Kevin Chun-Kai Wang, PhD**, postdoctoral fellow, Dermatology, has received the 2011 Career Award for Medical Scientists by the Burroughs Wellcome Fund.
- **Ronald Davis, PhD**, Professor of Biochemistry and of Genetics, is the recipient of the 2011 Genetics Prize presented by the Peter and Patricia Gruber Foundation. The award is presented to a leading scientist in recognition of groundbreaking contributions to any realm of genetics research.
- **Cheryl Gore-Felton, PhD**, Professor of Psychiatry and Behavioral Sciences, has been selected as a 2011-12 Fellow of the Hedwig van Ameringen Executive Leadership in Academic Medicine Program for Women at the Drexel University College of Medicine. The program is dedicated to preparing senior women faculty for positions of leadership at academic health centers.
- **William Newsome, PhD**, Professor of Neurobiology, is among the 37 new scholars who were recently elected to the American Philosophical Society. The APS honors leading scholars, scientists and professionals through elected membership and opportunities for multidisciplinary, intellectual fellowship.
- **Carla Shatz, PhD**, the Sapp Family Provostial Professor and director of the Bio-X program at Stanford, has been elected as one of eight foreign members of the Royal Society, which is composed of approximately 1,500 distinguished scientists around the world and is the oldest scientific academy in continuous existence.
- **Robert Siegel, MD**, Associate Professor of Microbiology and Immunology, is one of four recipients of the Walter J. Gores Faculty Achievement Award. These awards are given annually in recognition of excellence in teaching in its broadest sense.

- **Jessica Sin, PhD**, is the recipient of the Norman Blank Award 2011. This award is given to an outstanding graduating Stanford medical student in Radiology.
- **Justin Sonnenburg, MD**, Assistant Professor of Microbiology and Immunology, has the 2011 Investigators in the Pathogenesis of Infectious Disease Award by the Burroughs Wellcome Fund.

Congratulations to all.

Appointments and Promotions

Arash Alizadeh has been appointed to Assistant Professor of Medicine, effective 7/01/11.

Heike Daldrop-Link has been appointed to Associate Professor of Radiology, effective 6/01/11.

Tushar J. Desai has been appointed to Assistant Professor of Medicine, effective 6/01/11.

Michael Eisenberg has been appointed to Assistant Professor of Urology at the Stanford University Medical Center, effective 8/01/11.

Brian A. Hargreaves has been promoted to Associate Professor (Research) of Radiology, effective 6/01/11.

Booil Jo has been promoted to Associate Professor of Psychiatry and Behavioral Sciences, effective 6/01/11.

Aya Kamaya has been reappointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 10/01/11.

David A. Katzenstein has been reappointed to Professor (Research) of Medicine, effective 6/01/11.

Amelie Lutz has been appointed to Assistant Professor of Radiology at the Stanford University Medical Center effective 5/01/11.

Gary Luxton has been promoted to Professor of Radiation Oncology at the Stanford University Medical Center, effective 6/01/11.

Jose R. Maldonado has been reappointed to Associate Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 6/01/11.

Sam P. Most has been promoted to Professor of Otolaryngology – Head and Neck Surgery at the Stanford University Medical Center, effective 6/01/11.

Beverley Newman has been promoted to Professor of Radiology at the Stanford University Medical Center, effective 6/01/11.

Stephen J. Roth has been promoted to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 6/01/11.

Julien Sage has been promoted to Associate Professor of Pediatrics, effective 6/01/11.

Shreyas S. Vasanawala has been promoted to Associate Professor of Radiology at the Stanford University Medical Center, effective 6/01/11.

Dean's Newsletter

July 5, 2011

Relieving Pain in America

Late last fall the Institute of Medicine (IOM) of the National Academy of Sciences asked me to chair a committee to review the public health implications of pain in America. This project was mandated by the passage of the Affordable Care Act in March 2010, which stipulated that the IOM deliver a report on pain in America to the Congress and the National Institutes of Health by June 2011. Having witnessed the impact of pain on patients I have cared for over the years – especially as a pediatric oncologist – and having watched the impact of chronic pain on friends and family members, the extraordinary effects of pain on individuals, families and communities was abundantly clear to me. But as our committee learned during six meetings from the end of November 2010 through late April 2011, the magnitude and human and economic toll of pain in America is far greater than any of us imagined.

Studies or committees commissioned by the IOM are expected to respond in an objective data-driven manner to a specific set of questions or issues. It is this impartiality and integrity that makes IOM reports so respected and valued. Often IOM reports take 1-2 years to complete but our committee was charged to carry out its work on a remarkably accelerated timeline – given the magnitude and dimensions of the challenge. We were specifically asked to address five major issues: the public health dimensions and implications of pain in America; the demographic profile of who is impacted by pain and at what cost; the impediments to the effective treatment and prevention of pain; the current and future tools and techniques used to treat pain today, and the opportunities to create new knowledge or approaches to pain management through sponsored research and public-private partnerships in the future.

The 19-member committee that I chaired, along with Dr. Noreen Clark, Myron E. Wegman Distinguished University Professor and Director of the Center for Managing Chronic Illness, University of Michigan as co-chair, included a broad array of experts from medicine (including complementary medicine), surgery, dentistry, nursing, psychology, law, ethics, religion, journalism, and palliative care. We were fortunate to have on the Committee Dr. Sean Mackey, Associate Professor, Department of Anesthesia and Chief of the Division of Pain Management at Stanford. The Committee heard testimony from professional organizations and societies, academia, the NIH and FDA, the VA and the Department of Defense, as well as patients and advocacy organizations. More than 2000 public comments were received from patients and professionals about their personal and related experience with pain. The Committee held sessions

in three cities and worked extensively between and after meetings to construct the report that was delivered to Congress and the NIH on June 28th and to the public on June 29th.

The personal face of pain was always a centerpiece of the Committees' deliberations. That said, the dimensions of the magnitude of chronic pain in America is captured by two statistics: first that more than 116 million Americans suffer from chronic pain and second, that the economic pain in America is between \$560-635 billion dollars per year (twice what is spent on cardiovascular disorders or cancer). This averages more than \$2000 per American – which is an underestimate since these numbers do not include children, members of the military, incarcerated individuals or those in chronic care facilities.

The report is entitled ***“Relieving Pain in America: A Blueprint for Transforming Prevention, Care, Education and Research”*** and is now available online at <http://www.iom.edu/Reports/2011/Relieving-Pain-in-America-A-Blueprint-for-Transforming-Prevention-Care-Education-Research.aspx> and will be available in hardcopy in late fall. The blueprint includes 16 major recommendations and contains a timeline for their implementation. The Committee's work was guided by a number of underlying and overarching principles, including:

Guiding Principles Constructed by the Committee

- Effective pain management is a **moral imperative**, a professional responsibility and the duty of people in the healing professions.
- Chronic pain has a distinct pathology, causing changes throughout the nervous system that often worsen over time. It has significant psychological and cognitive correlates and can constitute a serious, separate disease entity. This means that **chronic pain can be a disease itself**.
- Pain results from a combination of biological, psychological and social factors and often **requires comprehensive approaches to prevention and management**.
- Given chronic pain's diverse effects, **interdisciplinary assessment and treatment** may produce the best results for people with the most severe and persistent pain problems.
- Chronic pain has such severe impacts on all aspects of the lives of its sufferers that every effort should be made to **achieve both primary and secondary prevention** of the transition from the acute to the chronic state through early intervention.
- While there is much more to be learned about pain and its treatment, **even existing knowledge is not always used effectively**, and thus substantial numbers of people suffer unnecessarily.
- The Committee recognizes the serious problem of diversion and abuse of opioid drugs, as well as questions about their usefulness long-term, but believes that **when opioids are used as prescribed and appropriately monitored, they can be safe and effective**, especially for acute, post-operative, and procedural pain, as well as for patients near the end of life who desire more pain relief.
- The effectiveness of pain treatments depends greatly on the **strength of the clinician-patient relationship**; pain treatment is never about the clinician's intervention alone, but about the clinician and patient (and family) working together.
- Many features of pain lend themselves to **public health approaches** -- a concern about the large number of people affected, disparities in occurrence and treatment, and the goal

of prevention as noted above. Public health education can help counter the myths, misunderstandings, stereotypes, and stigma that hinder better care.

Among the recommendations the Committee indicated should be completed before the end of 2012 are:

1. ***The Secretary of the Department of Health and Human Services should develop a comprehensive, population health-level strategy for pain prevention, treatment, management, education, reimbursement, and research that includes specific goals, actions, time frames and resources.*** This strategy should:
 - Describe how efforts across government agencies, including public-private partnerships, can be established, coordinated, and integrated to encourage population-focused research, education, communication and communitywide approaches that can help reduce pain and its consequences and remediate disparities in the experience of pain among subgroups of Americans.
 - Include an agenda for developing physiological, clinical, behavioral, psychological, outcomes, and health services research and appropriate links across these domains.
 - Improve pain assessment and management programs within the service delivery and financing programs of the federal government.
 - Proceed in cooperation with the Interagency Pain Research Coordinating Committee and the National Institutes of Health's Pain Consortium and reach out to private –sector participants as appropriate.
 - Involve federal agencies and departments (National Institutes of Health, Centers for Disease Control and Prevention, Food and Drug Administration, Centers for Medicare and Medicaid Services, Agency for Healthcare Research and Quality, Health Resources and Services Administration, Indian Health Service, Department of Defense, and Department of Veterans Affairs); private sector entities (pain advocacy and awareness organizations; health professions associations; health care providers; health professions educators; private insurers; and accreditation, certification, and examination organizations); and relevant state-level entities.
 - Include ongoing efforts to enhance public awareness about the nature of chronic pain and the role of self-care in its management.

The development of this strategy should be completed by the end of 2012.

2. ***Develop strategies for reducing barriers to pain care.*** The population-level strategy referred to in #1 above, should include identifying and developing comprehensive approaches to overcoming existing barriers to pain care, especially for populations that are disproportionately affected by and undertreated for pain. Strategies also should focus on ways to improve pain care for these groups.
3. ***Support collaboration between pain specialists and primary care clinicians, including referral to pain centers when appropriate.*** Pain specialty professional organizations and primary care professional organizations should work together to support the collaboration

of pain specialists with primary care practitioners and teams when primary care providers have exhausted their expertise and the patient's pain persists.

4. ***Designate a lead institute at the National Institutes of Health responsible for moving pain research forward and increase the support and scope of the Pain Consortium.*** At the same time, NIH should increase financial resources and staffing support for and broaden the scope of the Pain Consortium and engage higher-level staff from the institutes and centers in the consortium's efforts. The Pain Consortium should exert more proactive leadership in effecting the necessary transformation in how pain research is conducted and funded.

The Committee recommended that the four recommendations noted above be completed by the end of 2012, and the other twelve recommendations be implemented by the end of 2015. I certainly recognize that listing them as I have above takes them out of context and may does not make their rationale clear or even compelling. However, as is noted in the report, the findings and recommendations revolve around a single conclusion: ***Pain affects the lives of more than a hundred million Americans, making its control of enormous value to individuals and society. To reduce the impact of pain and the resultant suffering will require a transformation in how pain is perceived and judged both by people with pain and by the health care providers who help care for them. The overarching goal of this transformation should be gaining a better understanding of pain of all types and improving efforts to prevent, assess and treat pain.***

Each day we are called on to address many different issues or problems. At one level, committing time to a Committee like this certainly takes time that could have been used for other purposes. Hopefully the impact of the Committee's findings and recommendations will be meaningful and make these efforts justifiable. That still remains a hope to be fulfilled.

Sharing A Perspective on Graduate Education

In the May 8th issue of the Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/05_09_11.html#5) I commented on "The Emerging Debate About Graduate Education" and referenced the series of articles in the April 21st issue of *Nature* that raised questions about the numbers of PhDs being educated in the US and worldwide. I also mentioned that the NIH was launching a Biomedical Workforce (BWF) Taskforce that would be chaired by Dr. Shirley Tilghman, President of Princeton University and a highly distinguished scientist who had also raised the question of whether the US was educating too many PhDs for too few jobs. When I wrote that brief commentary I didn't know that the NIH BWF Task Force would ask me to attend their first meeting and speak from the perspective of research-intensive medical school. Because the work of the Task Force is closed I was only able to be present for the portion related to my presentation. Since the outcome of this task force will almost certainly have an impact and since the issues regarding graduate education are of broad interest, it seems prudent to share some of the comments I provided to NIH.

While the focus of the BWF Task Force is on PhD education I provided some background on our MD program as well, especially since a number of our students pursue joint degree programs. In doing so I described the multiple career pathways open to medical students, especially the opportunities to develop additional knowledge, skills and degrees in business, law, education as well as science and engineering.

Our PhD programs are also unique among medical schools in a number of important ways. First we have as many PhD students as we do medical students and view our graduate students community as equally valued and essential to our mission as our MD students. We have both department-specific PhD programs as well as interdepartmental PhD degree programs (e.g., cancer biology, immunology, neuroscience, stem cell biology & regenerative medicine). We also benefit from a shared bioscience admission process that includes related programs in the Schools of Medicine, Humanities and Sciences and Engineering and that permits mobility of students across programs. While there are not similar joint degree programs for PhD students, one unique program is the Masters of Medicine Program that was initiated by Dr. Ben Barres, Professor and Chair of Neurobiology in 2006 (see: <http://msm.stanford.edu/>).

One of the important issues in graduate education (in either bioscience or medicine) is the length and duration of training – especially if the average of 5.5 years for PhD education is coupled with 3-5 additional years of Postdoctoral Training. Accordingly it is important to review PhD education in association with postdoctoral training – as we have done in our planning groups and our 2010 Think Tanks on “*Beginning to Think About Graduate Education*” (see: http://deansnewsletter.stanford.edu/archive/10_11_10.html#3) and “*Thinking About Postdoctoral Fellows and Scholars*” (see: http://deansnewsletter.stanford.edu/archive/07_26_10.html#2). This was very much featured in our discussion at this past January’s Strategic Planning Leadership Retreat (see: http://deansnewsletter.stanford.edu/archive/01_24_11.html#1).

Acknowledging that a goal of graduate education at medical schools like Stanford is to educate and train future leaders and academicians, we also need to think more broadly about the career paths students pursue – and for a variety of reasons. Just over half of our PhD graduates enter academia. And the numbers of jobs available in academia are limited. Those who choose other paths should not be considered as doing so because they couldn’t make it academia. As we heard during our think tanks and retreat, many students discover during their time in graduate school that their career interests are elsewhere – in business, industry, teaching among others. All too often such students feel they must hide her/his career ambitions lest they lose the respect – and support – of the PhD mentor or committee. This is an issue that requires honest reflection and discussion. It is widely agreed that PhD education is a great model by which to learn to think independently and critically, generally through the design and completion of experiments and their analysis and communication. These are skills that are transferable to many different career paths – not simply academia.

Unlike the diversity of programs and pathways we have constructed for medical students at Stanford, there is not the same level of flexible learning or dual degrees for PhD students. There are certainly lots of reasons for this but this is something that requires consideration and likely revision. An effort to revisit the curriculum for PhD bioscience students at Stanford is in the offing and hopefully will shed light on this issue.

This leads to one of the important questions that the NIH BWF Task Force is considering – are we training too many PhD students? My response to the committee was that it would be unwise to restrict the number of students being educated in PhD programs today, and that it would be very damaging to reduce the number of training grants supported by the NIH. More specifically, I underscored that restricting the number of students would negatively impact the pipeline and also the outcomes. As Dr. Dan Herschlag, Professor of Biochemistry, recently analogized, as a

nation we need to keep the funnel wide at the outset of the education pathway, since it is unclear which students will ultimately emerge as the successful candidates for major academic careers. He further compared this to a baseball analogy – that often begins with college leagues (or sandlots) and that for those destined for careers in professional baseball, selects some for the minor leagues and, ultimately a select few for the majors. That seems like a reasonable analogy with one important exception. As educators we need to think more critically about those PhD students who don't want to join the “minors league” or those who don't make it from the minors to the majors. The default option shouldn't be career failure – it needs to be career alternatives. This will require us to broaden the education opportunities and experiences for PhD students, the questions being when and how to do this. But these are valid and important questions that we need to focus on more clearly.

One issue for which there is broad consensus is that the financial model underpinning graduate education needs radical change. The reliance on training grants and institutional support – and even the expectations set by the NIH – have significant and somewhat damaging implications. The solutions are not straightforward but the current pathway is not sustainable. While not a complete solution, one of our highest priorities for fundraising is to generate support for PhD education. Coupled with this is the need to also address the important conundrum of the length of education and training – by critically reassessing what can be done to shorten the overall length of training and to make the process also more flexible, for reasons noted above. Another critically important issue is to continue to diversify our graduate student community – a goal that has been ongoing at Stanford for some years. Added to this is to think of graduate education more globally – both in where students come from (which is currently limited by NIH training grants) and where they will go to pursue their careers.

It will be interesting to see what comes of the NIH BMW Task Force. Perhaps more importantly will be what comes from our internal work groups and efforts at Stanford on graduate education and postdoctoral training – topics I will return to with updates on our progress in future issues of this Newsletter.

A Person of Courage and Integrity

I have long respected Dr. Eugene Carragee's evidence-based approach to the management of back pain. Dr. Carragee is a Professor in the Department of Orthopedic Surgery and Chief of the Spinal Surgery Division. He is an experienced and thoughtful clinician and surgeon. In addition to being an outstanding faculty member at Stanford, Dr. Carragee also deserves respect for his personal courage as a military surgeon and command leader for the US Army, where he cared for refugees as well as individuals injured in battle in the Vietnam, Cambodia and Iraq. On his various tours of duty over more than two decades, he has also sustained serious personal injuries - but has always put others before himself. Now he is embroiled in another highly visible battle, which is driven by evidence, ethics and integrity. I won't recount the current events in detail other than saying that he has raised questions about the validity of reports appearing in *The Spine Journal*, where he serves as the Editor-in-Chief. This story has dominated a number of news reports in recent weeks and is well covered in <http://med.stanford.edu/ism/2011/june/carragee-profile-0628.html>. But it is important to underscore his courage in this current debate. Driven by integrity – and ultimately respect for the safety of patients – he has been willing to take on a contentious issue knowing that it could entail both personal and professional harm. But Dr. Carragee's decision to stand for the integrity of his discipline and the community he serves

deserves our respect regardless of one's stand on the issues. He is truly a person with courage – an attribute often lacking in our world today.

Women and Medicine

Dr. Karen Siebert concludes her Op-Ed article ***“Don’t Quit This Day Job”*** as follows: *“If medical training were available in infinite supply, it wouldn’t matter how many doctors worked part time or quit, because there would always be new graduates to fill their spots. But medical schools can only afford to accept a fraction of the students who apply”* (see: http://www.nytimes.com/2011/06/12/opinion/12siebert.html?pagewanted=1&_r=1&sq=karen%20siebert&st=cse&scp=1). This statement would be provocative enough if it applied broadly, but Dr. Siebert targets her remarks to women in medicine. She begins her commentary with the disclaimer that she has always worked full-time and that she is also the mother of four children. However, she quickly notes, “increasing numbers of doctors – mostly women – decide to work part-time or leave the profession.” In her opinion piece she conveys her thoughts on part-time work by doctors as a problem for patients and for society. And while her arguments have some rationale, her focus on women in medicine is a disservice and misses many important points. The reactions to her article (mostly negative) are numerous and convey strong disagreement with her position and commentary (See: More on Women in Medicine (<http://parenting.blogs.nytimes.com/2011/06/15/more-on-women-and-medicine/?scp=1&sq=women%20and%20medicine&st=cse>)).

As dean of a medical school I certainly recognize the costs of medical education – to individuals, institutions and society. The shortage of physicians, especially in primary care, has been a topic of discussion particularly during the contentious debate about the future of health care in the US. Organizations like the Association of American Medical Colleges (AAMC) have advocated for increasing the size of medical school classes by 30% and on June 20th the AAMC reported that *“In response to the increased need for physicians across the country, first-year enrollment in the nation’s medical schools continued to grow in 2010 despite more institutions citing economic concerns, according to the 2010 Medical School Enrollment Survey from the AAMC. The survey indicates that M.D. enrollment is projected to reach 21,041 by 2015, 27.6 percent above 2002 enrollment and just below the 30 percent increase called for by the AAMC in 2006 in response to the nation’s physician shortages. Between 2002 and 2010, 80 percent of accredited medical schools increased their enrollment by two or more positions.”*

Importantly half of the students currently enrolled in medical school are women – which is a major advance of decades ago when I began my own education and training. If one were to extend Dr. Siebert’s logic we would need to further increase the size of medical school classes to compensate for future loss of the physician workforce, or not admit women to medical school, or admit only those who signed a vow to work full-time. Clearly these are all ridiculous options and none address the issues, problems or solutions.

I have been part of the medical work force for decades. I doubt anyone would accuse me of working anything but full-time, but that also misses the point. Like many physicians in academic medicine I have worked “part-time” on many topics, including patient care. But that is not the primary issue either. The reality is that a life in medicine is a demanding one. It is also a privileged career path that can be deeply rewarding, valuable to society, and personally meaningful. For many physicians however, the constant demands of time and work-pressure

result in “burning out,” not infrequently in mid-career, or becoming disenchanted, disillusioned, or even angry with the life of being a doctor. Some of these reactions impact the choice of medical career paths (primary care vs. specialty), the location of work (rural vs. urban), the size and scope of practice (group vs. solo or small) and much more. The demands of a career in medicine almost inevitably take a toll on personal life, marriage, partnerships, relationships and family. And the incidence of substance abuse and suicide is higher in physicians than in other careers. While the causes of these life events are complicated, they are not solved or even ameliorated by having a “one-size-fits-all” expectation or making different career paths and choices less valued or meritorious. We need to think differently.

From my perspective we should celebrate rather than decry different career paths. We should also seek ways of sustaining a life in medicine over the career of a physician or academician in a manner that is flexible and that permits new directions and options to be pursued over time. The ease of doing this does depend on the complexity of the job and its requirements. For example, a part-time career or shared practice model can be quite successful in clinical medicine and lots of examples of this exist. I am personally aware of one since my own daughter is successfully blending a shared practice with family and personal balance. I believe her patients are well-served, as are her colleagues, family and her own career satisfaction. And this neither is unique nor is it gender specific. Such choices need to be individually derived – but surely should not be driven by expectations that one path (part-time) is inferior to another.

For some years I have been questioning how we can create more flexible career paths within academia, being cognizant of the pressures felt by junior faculty – and senior faculty – given the demands of job, family and more. A couple of years ago I asked Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, and Christy Sandborg, Chief of Staff at the Lucile Packard Children’s Hospital and Professor of Pediatrics, to take on this challenge. They and their colleagues presented some of their efforts at our Strategic Planning Leadership Retreat this past January in a panel discussion entitled “***Flexibility in Faculty Careers – A Mandate for Cultural Change***” (see: http://deansnewsletter.stanford.edu/archive/01_24_11.html#1). They have continued to work on this challenge and are developing a new model for faculty entitled “Academic Biomedical Career Customization” that recognizes the need for faculty to apportion different amounts of time and effort during different stages of life and career. For example, a faculty member might work less, or on different issues, during the time when children and family responsibilities are significant and more during other portions of their career. This program looks at a career having a trajectory of decades with changing personal and professional needs and demands over time. It gets away from the issue of part-time vs. full-time and seeks to individualize one’s career path. Obviously this too will require lots of customization – which is also to say, that it avoids the pitfall of “one-size-fits-all.” Whether we – and our institutions – can make such a program successful remains to be seen.

While it is important to raise issues and concerns as Dr. Siebert has done, it is important to be thoughtful so that we don’t arrive at simplistic conclusions. What may have worked for Dr. Siebert (or me for that matter) may not work for others. We certainly need to set expectations that meet the needs of patients, institutions and societies. But doing it only one way – or in pretending that one’s way is better than another’s way – has surely not made medicine a successful career for many physicians at this point in our history. So, thinking creatively and honestly about new ways of serving patients and the careers of those who deliver patient care seems timely and important. But is not a matter of part-time versus full-time but of thinking

differently about careers in medicine – for women and men – that is needed. Obviously more will follow on this important issue.

Facilities Updates

As you likely know, the Palo Alto City Council voted unanimously on June 7th to approve the development agreement that gives a green light to Stanford Medical Center Renewal project (see: <http://stanfordhospital.org/newsEvents/newsReleases/2011/city-council-approves-renewal.html>). While one important issue regarding the Arboretum Day Care Center remains to be resolved (but seems likely to be so), it seems timely to apprise you of some of the changes that will be taking place over the next months to year(s) as these projects get underway. The (hopefully) final approval meeting will be held on July 11th. With that in mind, I asked Chris Shay, Facilities Planner, and Niraj Dangoria, Assistant Dean, Facilities Planning and Management, to give an update on these projects – which impact the hospitals and the portion of the medical school (specifically the original ED Stone buildings) that are within the City of Palo Alto. You can also visit the School of Medicine facilities website (see: <http://medfacilities.stanford.edu/>) which has lots of updates on ongoing and future projects. Here is the update from Chris and Niraj:

The renewal of our facilities will be a long-term project, with exceptional future benefits but with a number of inconveniences for our visitors, patients, faculty and staff along the way. Construction will commence this summer with the necessary infrastructure work being installed to support our new buildings. Once the infrastructure has been placed, the new LPCH Hospital, Stanford Adult Hospital, and the School of Medicine Foundations of Medicine 1 (FIM1) building can start construction. For full details on the facility renewal plan, please visit the newly opened project website at: <http://www.stanfordpackard.org/>. Information on the work starting now can be found at: <http://www.stanfordpackard.org/preconstruction>.

Needless to say, construction related inconveniences should be anticipated during the project. To be fully informed about what is going to take place it is worth spending a few minutes at the Renewal website (<http://www.stanfordpackard.org/>) to learn more about how construction related issues might impact your work. It is also worth being informed since is likely that we will be asked by patients, visitors, and other university faculty, staff and students for assistance in dealing with these changes. To support your own information and you ability to help inform others, the website contains a wealth of information on the new facilities and the benefits to our community. The Renewal team is working hard to ensure that inconveniences to the Medical Center are kept to a minimum, but if you have a concern please feel to reach out to them at: info@stanfordpackard.org.

We will provide updates along the way as these projects unfold in the months and years ahead.

Employee Survey—Action Plans

Now that we are almost halfway through the calendar year, Marcia Cohen, Senior Associate Dean for Finance and Administration, would like to take the opportunity to update you on the progress that has been made since the results of our employee survey was distributed to

departments in October 2010. Department administrators have met with their staffs to create action plans to address issues that came to light as part of the survey. To date, 57 departments and units have submitted action plans to the Employee Survey team. In some cases, where a department is large, multiple action plans have been created.

The top five areas that appear in these action plans are: Feedback and Coaching (49 plans; 32 of which focus on performance appraisals); Communication (27 plans); Change Management (25 plans); Professional Development (22 plans); and Working Conditions (13 plans; examples of conditions to be addressed include equipment, wellness, pay, space, trash collection, cleanliness).

The action plans also include ideas such as: setting up a tracking plan to evaluate staff development progress for individuals; implementing Wow/Bravo cards to recognize staff performance success on the spot as it occurs; other recognition awards; creating a departmental Wiki with Resource list, contacts and “How to Do” FAQs; sponsoring an Administrative Retreat for staff; holding regular town hall meetings; and providing quarterly brown bags where administrative and research staff can share information about current departmental research. This is just a small sample of the many ideas that have come forward in the action plans developed as part of the survey.

Thank you to all of the School of Medicine staff who participated in the Stanford Staff Employee Survey last fall and to everyone who has assisted in developing action plans to address areas identified for improvement. The efforts taken as a result of the survey are truly impressive; we are extremely pleased with all the positive response. Your continued participation in implementing and evaluating the action plans will help us make the School of Medicine and Stanford an even better place to work.

Remembering Dr. Bruce Tune

We were informed this past week that Dr. Bruce Tune, Professor of Pediatrics, died at his home on June 25th of complications from Parkinson Disease. He was 71 and is survived by his wife Nancy Tune along with children, grandchildren and mother.

Dr. Tune founded the division of pediatric nephrology at Stanford and was instrumental in helping to launch the kidney transplant program at the Lucile Packard Children’s Hospital – now one of the most successful programs in the world. In addition to his academic and professional achievements, Dr. Tune will be remembered as an outstanding and compassionate physician and teacher. He will be missed by the Stanford community, and especially the children and families he cared for during his distinguished career.

Upcoming Event: *Medicine 2.0 Summer Discount for Stanford Employees*

Medicine 2.0

September 16-18

Li Ka Shing Center for Learning and Knowledge

The Medicine 2.0 conference (<http://stan.md/medicine20>) is coming to Stanford on September 16-18. Medicine 2.0 is an international conference dedicated to the future of social media and technology's exciting,

ever-evolving role in medicine. The conference will also host the first-ever Stanford Summit @ Medicine 2.0, a day of talks by inspirational leaders who will discuss these technologies and their role in the future of health, medicine, and biomedical research. Among the speakers are Jennifer Aaker, PhD, the General Atlantic Professor of Marketing at the Graduate School of Business; Charlie Cheever, co-founder of Quora; Susannah Fox, an associate director at the Pew Internet & American Life Project; Philip Pizzo, MD, the Carl and Elizabeth Naumann Dean of the School of Medicine; and Abraham Verghese, MD, professor of medicine and noted author.

So that as many Stanford faculty, students and staff can attend Medicine 2.0 as possible, the conference organizers are offering significant discounts on tickets now through August 1. Affiliates can register for the entire conference for only \$799 (a 44% discount), the Stanford Summit for \$199 (a 60% discount), or the research-focused days for \$699 (a 30% discount). To register, visit the this Stanford registration page: <http://stan.md/med2regforsu>

Appointments and Promotions

Tyler Aguinaldo has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 3/1/2011.

Valerie Berry has been reappointed to Clinical Assistant Professor of Medicine, effective 7/1/2011.

Rajinder K. Chitkara has been appointed to Clinical Professor (Affiliated) of Medicine, effective 9/1/2011.

Ana M. Crawford has been promoted to Clinical Assistant Professor of Anesthesia, effective 6/1/2011.

Thao Duong has been reappointed to Clinical Associate Professor (Affiliated) of Orthopaedic Surgery, effective 6/1/2011.

Ram Duriseti has been promoted to Clinical Associate Professor of Surgery, effective 9/1/2011.

Stafford Grady has been appointed to Clinical Associate Professor of Pediatrics, effective 6/1/2011.

Steven Goodman has been appointed to Professor of Medicine, effective 7/01/2011.

Charles Hill has been reappointed to Clinical Assistant Professor of Anesthesia, effective 6/1/2011.

David I. Kaufman has been appointed to Clinical Associate Professor of Anesthesia, effective 6/1/2011.

Seung Kim has been promoted to Adjunct Clinical Associate Professor of Surgery, effective September 1, 2010.

Roger Klima has been reappointed to Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 9/1/2009.

Joshua Korman has been promoted to Adjunct Clinical Associate Professor of Surgery, effective September 1, 2010.

Carol Lin has been appointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 6/1/2011.

Alexander C. Liu has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 2/1/2011.

Seema Nagpal has been appointed to Clinical Assistant Professor of Neurology and Neurological Sciences and of Neurosurgery, effective 8/1/2011.

Teimour Nasirov has been promoted to Clinical Assistant Professor of Cardiothoracic Surgery, effective 7/1/2011.

Cynthia Nguyen has been promoted to Adjunct Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective April 1, 2011.

Maurice Ohayon has been reappointed to Professor (Research) of Psychiatry and Behavioral Sciences, effective 8/01/2011.

Zakia Rahman has been reappointed to Clinical Assistant Professor of Dermatology, effective 7/1/2011.

Roy R. Sasaki has been appointed to Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 6/1/2011.

Gabriel Schonwald has been promoted to Adjunct Clinical Assistant Professor of Anesthesia, effective May 1, 2011.

Theodore Scott has been promoted to Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 6/1/2011.

Rajesh P. Shah has been appointed to Clinical Assistant Professor of Radiology, effective 8/1/2011.

Chitra Venkatasubramanian has been reappointed to Clinical Assistant Professor of Neurology and Neurological Sciences, effective 7/1/2011.

Craig Zone has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 7/16/2011.

Dean's Newsletter

July 25, 2011

Important New Leadership Appointments and Promotions

Dr. Quynh Le Named Next Chair of the Department of Radiation Oncology

I am extremely pleased to announce that Dr. Quynh-Thu Le will become the next Chair of the Department of Radiation Oncology, effective September 1, 2011. Dr. Le will succeed Dr. Richard Hoppe, who has served with great distinction as Chair of Radiation Oncology since September 1, 1994.

Dr. Le was selected through a national search and received incredible endorsement from the Search Committee, which was chaired by Dr. Bev Mitchell, Director of the Stanford Cancer Institute and George E. Becker Professor in Medicine and Professor, by courtesy, of Chemical and Systems Biology, along with Drs. Youn Kim, Co-Chair of the Committee and Professor of Dermatology; Steven Chang, Professor of Neurosurgery; Michael Clarke, Professor of Medicine and Deputy Director, Stanford Institute for Stem Cell Biology & Regenerative Medicine; Paul Fisher, Professor of Neurology & Neurological Sciences and of Pediatrics; Sam Gambhir, Professor of Radiology and Bio-X, Charlotte Jacobs, Professor of Medicine (Oncology) Emerita; Stefanie Jeffrey, Associate Professor of Surgery; Norbert Pelc, Professor and Associate Chair of Radiology; Joseph Presti, Professor and Interim Chair of Urology; Jody Puglisi, Professor and Chair of Structural Biology; Sridhar Seshadri, VP Cancer Center and VP Organizational Effectiveness, SHC; Clare Twist, Associate Professor of Pediatrics (Oncology); and Pam Molano, Chief Administrative Officer of Faculty Practice Organization, LPCH.

I also want to thank Ms. Kendra Baldwin for her exceptional contributions in staffing and supporting the work of the search committee. Ms. Baldwin continues to gain the deep respect and admiration of our search committees and, importantly, each of the candidates who participate in our leadership searches. In addition, I want to acknowledge the important work of Ms. Julie Moseley, Director of Organizational Effectiveness, in the search committee process. Leadership of clinical departments is increasingly challenging and requires not only the requisite academic accomplishments but also evidence of leadership capacity and ability. Selecting clinical chairs who combine academic success with emotional intelligence, sensitivity and the ability to lead successfully is essential to the future success of Stanford Medicine. Evidence that Dr. Le possesses these attributes came through in the discussions I had with national leaders in Radiation Oncology and Cancer Medicine about her and further affirms that she is a great choice for Stanford and this important role.

Dr. Le was born in Vietnam and did her undergraduate work at the California Institute of Technology, where she did a dual major in chemistry and biology as a Carnation Merit Scholar. She received her MD from UCSF in 1993, where she was elected to AOA and received the Sadie E. Berkove MD Fellowship as the top graduate in the class of 1993 and the Janet M. Glasgow Memorial Award as the top-graduating woman. She then did her Residency in Radiation

Oncology at UCSF and became Board Certified in this specialty in 1998. Dr. Le joined the Stanford faculty in 1998 and rapidly ascended in performance and excellence; she was appointed Director of Clinical Research in the department in 2005 and promoted to Professor in 2007. Along the way Dr. Le assumed national leadership in the American Society of Clinical Oncology, the American Society of Therapeutic Radiation and Oncology, the American Radium Society, American Association for Cancer Research and American Board of Radiology, among others. I heard from leaders in these organizations how much her knowledge and leadership have been valued and respected.

Dr. Le's work in the management of head and neck cancers, one of the most challenging of tumor types, is highly regarded and is codified in well over a hundred scientific publications along with a number of reviews in journals and text books. She has shared her pioneering work with colleagues across the USA and around the world in numerous society and academic meetings. She has also won prizes for education and has been a recipient of the Henry Kaplan Memorial Prize for Resident Education on three separate occasions.

I also want to thank Dr. Rich Hoppe again for his wonderful leadership as Chair of Radiation Oncology over nearly 18 years (including time when he served as interim chair). The Department and School will recognize his exceptional leadership on the evening of August 26th. The Stanford Department of Radiation Oncology, founded by Dr. Henry Kaplan, one of the most important leaders in the field and at Stanford, is among the most distinguished in the world. The life of Dr. Kaplan and, in many ways, that of the department and Stanford, are well told in the exceptional book by Dr. Charlotte Jacobs, the Drs. Ben and A. Jess Shenson Professor in the School of Medicine, Emerita, entitled "*Henry Kaplan and the Story of Hodgkin's Disease*," published in 2010 by Stanford University Press. With Dr. Le's appointment a new chapter begins, and we all look forward to its story unfolding over the years ahead.

Dr. Dan Herschlag Will Become Senior Associate Dean for Graduate Education and Postdoctoral Affairs

On September 1, 2011 Dr. Dan Herschlag, Professor of Biochemistry, will become Senior Associate Dean for Graduate Education and Postdoctoral Affairs, succeeding Dr. John Pringle, who has served with distinction in this role since 2006. Before welcoming Dr. Herschlag I want to thank Dr. Pringle again for his many important contributions to improving the education and lives of our graduate students and postdoctoral scholars.

Dan Herschlag joined the Stanford faculty as an Assistant Professor of Biochemistry in 1992 and became Professor of Biochemistry and of Chemical Engineering and, by Courtesy, of Chemistry, in 2002. As noted on his website, "The overarching goal of the Herschlag Lab is to understand the fundamental behavior of RNA and proteins and, in turn, how these behaviors determine and impact biological catalysis and biology. The lab takes an interdisciplinary approach, spanning and integrating physics, chemistry and biology through fruitful interactions with collaborators and a wide range of techniques are employed." In addition to his pioneering research, for which he has won numerous awards and honors, Dan has had a longstanding interest and commitment to graduate and postdoctoral education. He made terrific contributions at our 2010 Think Tanks on graduate and postdoctoral education and to our Strategic Leadership Retreat in January 2011 (see: http://deansnewsletter.stanford.edu/archive/01_24_11.html#1).

Over the next two years Dan will focus on some of the key issues facing graduate and postdoctoral training, from the financial models supporting these programs to the curriculum foundations for education and new paths for training to the opportunities for Stanford graduates in academia, industry and beyond. We look forward to benefiting from Dr. Herschlag's knowledge, expertise, commitment and passion. And we are the appreciative beneficiaries of John Pringle's many contributions over the past several years.

Dr. Clarence Braddock Has Assumed the Role of Associate Dean for Graduate Medical Education.

Over the past fifteen years, Dr. Larry Shuer, Professor of Neurosurgery, has provided dedicated leadership as the Medical Director for Graduate Medical Education (GME) at Stanford Hospital and Clinics and Associate Dean for Graduate Medical Education at the School of Medicine. During his tenure in these roles, Dr. Shuer and Ann Dohn (Director of GME) have presided over numerous institutional and program accreditations and have enabled Stanford to sustain respect and excellence in Resident and Fellow education – especially given the many rules and regulations that impact these programs. Indeed, Dr. Shuer has worked with department chairs and program leaders throughout the medical center to get ready for the sweeping new regulations on Resident Duty Hours that went into effect in July 2011. We must all be appreciative and grateful for his work – which has often been challenged by various regulatory requirements – but which has been highly successful over the years.

Thankfully, Dr. Shuer will continue to provide advice and counsel regarding GME during a transition to new faculty leadership and, I am sure, over the years ahead. As I write this update, GME as we have known it in the US is threatened by the changes in Medicare that are likely to unfold as part of the debt-ceiling negotiations that are on-going in Washington. Over the next week(s) it will become clear as to how much of GME will continue to be funded by Medicare and how this will develop over the years ahead. While changes in GME funding have long been expected, the rate and extent of the changes and likely damage are truly unprecedented. A primer on this important issue is available at <https://www.aamc.org/initiatives/gmefunding/>.

As Dr. Shuer prepares to transition from his roles, I am pleased to announce that Dr. Clarence Braddock III, Professor of Medicine has been appointed the new Associate Dean for GME. Over the next six months he will also transition to leadership as the Medical Director for Graduate Medical Education at Stanford Hospital and Clinics. He will work closely with Dr. Shuer during the transition period. Dr. Braddock will also continue to function as Associate Dean for Medical Student education and to report directly to Dr. Charles Prober, Senior Associate Dean for (Undergraduate, Graduate & Continuing) Medical Education. As you likely know, one of our key goals is to better integrate and coordinate undergraduate and graduate medical education into a more seamless educational experience. Because Dr. Braddock is a highly recognized leader in medical education and has a long career and many accomplishments in both medical student education and GME, we believe he is uniquely qualified for these new roles. To make more time for his enhanced focus on education, he will also be transitioning out of his role as Medical Director for Quality for the Department of Medicine.

With all the changes underway in GME we believe this is a unique time to reconsider our priorities and goals for healthcare delivery and the important interface of Residents as learners and care providers. I am confident that our leadership team – and the collaborations that will continue to unfold – will foster success during times of change.

Cori Bossenberry, Niraj Dangoria and Sam Zelch Promoted to Associate Dean Status

Because of their expanded scope of responsibilities and impact on the School of Medicine's missions I am pleased to announce that three of our key institutional leaders will now also have the title of Associate Dean. Each has a broad portfolio of responsibility that is both discrete as well as interactive with multiple domains of the School, Medical Center and University.

Cori Bossenberry is the Executive Director of Human Resources for the School of Medicine. Her office is involved in the recruitment, appointment, career development and training, well-being, recognition, and wellness of our diversified workforce that numbers in thousands (see: <http://hrg.stanford.edu/>). She and her colleagues have developed an organization of exceptional quality and function, and we are all extremely grateful and respectful for the role that they play in our missions of education, research and patient care.

Niraj Dangoria is Director of Facilities and Planning for the School of Medicine, where he has also served as Assistant Dean. Under his leadership the medical school has taken on the greatest and most wide-sweeping facilities programs in its history. These include, on our campus, completed major building projects (Li Ka Shing Center, Lorry Lokey Stem Cell Building) as well as those currently planned (the Jill and John Freidenrich Center for Translational Research) and those now in earlier planning stages (CJ Huang Building, FIM1). They also include as well major offsite projects that are now underway, including a Center for Technology and Innovation, and, of course the coordination with our hospital partners in the major new projects at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. Niraj and his colleagues are also well known to virtually every faculty member and department chair seeking space (which seems to be everyone at times), and have a well deserved reputation for doing an outstanding job in planning and coordinating to meet expectations as best as possible with what are always limited resources. His role thus touches all of our missions in education, research and patient care.

Sam Zelch is the Chief Financial Officer for the School of Medicine, and he also serve as an Assistant Dean. The school is now a \$1.4 Billion operation in terms of revenues. It has an exceptionally complex, matrix-based financial model involving departments, institutes, centers and central administrative resources that also includes major interactions with both the hospitals and the university – each with different funds flow models and financial needs and expectations. I have noted in the past that Stanford School of Medicine is one of the most financially successful medical schools in the nation, and in no small part this is a consequence of the rigorous and thoughtful financial management that Sam Zelch and his colleagues provide – from current operational, programmatic and capital budgets to short and long-term planning. Given the uncertainties in stable funding for research and the changes anticipated in healthcare policy and payments, the role of his office and his expertise will have ever greater impact and importance across all of our missions in education, research and patient care.

I am pleased to recognize Cori Bossenberry, Niraj Dangoria and Sam Zelch by their respective promotions to Associate Dean in the School of Medicine. Please join me in congratulating them.

A New Model and Program for Medical Philanthropy and Development

Although we have enjoyed considerable success in our fundraising and philanthropic efforts over the past decade and in particular with the recent Stanford University Campaign, The Stanford Challenge, we have been less well served by our “siloed” development organizations at the central University, the Medical School and Stanford Hospital & Clinics (SHC). Over the past several months, Amir Rubin, President and CEO of SHC, and I have discussed the pros and cons of the current model (an SHC Office of Hospital Development and a School of Medicine Office of Medical Development, each with separate leaders and agendas) compared to a more integrated and coordinated model to support both SHC and SoM under a banner like Stanford Medicine (as a placeholder name). Even though the hospital and school offices attempted to work collaboratively, the reality is that the two separate organizations created a sense of competition and confusion – to our faculty and, more importantly, to our community. Amir and I decided that it would be wise to explore a new model; in this effort we were guided by Martin Shell, Vice President of the Office of Development for Stanford University, and Michele Schiele, who was recruited to Stanford this past January to serve as Senior Associate Vice President for University Development.

The result of these discussions will be a new Development Program for Stanford Medicine that will combine the talented teams already in place for hospital and medical school development along with alumni relations. This new Development Program for Stanford Medicine will be led by Michele Schiele and will house all of the employees in a central and coordinated office. Even though this new organization will not be fully operative until September 1st, it has met with considerable support and enthusiasm at both the staff level and by the University leadership.

We are at the cusp of new and exciting challenges. With the plans to proceed with the construction and renovation of SHC approved, there are considerable fundraising needs for construction and clinical program development. There are also extraordinary needs to support the education of medical and graduate students and also our faculty – especially during a period of incredible change due to the anticipated decreased support for research and patient care services. By fusing our programs and developing compelling visions for how Stanford Medicine will change the landscape of the future of healthcare delivery, biomedical research and education – and serve our communities locally and globally – we are poised for exceptional opportunity despite the bountiful challenges that lie ahead. Our goal is to do no less than double our current fundraising success over the next several years. We believe that our new model will enable us to achieve these and many other goals and that it will further foster our efforts to work in a collaborative and more integrated manner. We will be sharing more about this exciting new “development” in the weeks and months ahead – and, importantly, how you can help.

New Version of CAP (Community Academic Profiles) Will Add Social Networking Functionality

This Fall the School of Medicine will deploy a private social networking platform that will be available to the entire School community and tightly integrated into a new version of the Community Academic Profiles (CAP) system. Profiles for all individuals at the School of Medicine describing their professional expertise, experience, interests and contact information will be provided and a suite of social networking features will be available, in a protected environment, with the goal of fostering a vibrant virtual community and supporting collaboration. CAP profiles for staff will be created for the first time and in conjunction with existing profiles for all faculty, postdocs and students, the online community will

include approximately 10,000 people. The new secure CAP social networking platform will support features commonly used on platforms such as Facebook and Twitter including interactive comments, "activity streams", the creation of private groups, file sharing between users and access on mobile devices. The platform is certified to store Protected Health Information (PHI) to support the School's research and educational mission and it is not intended for use in patient care. As part of this project, the School has licensed technology from [Salesforce.com](https://www.salesforce.com), used in the Salesforce Chatter system.

Each CAP profile "owner" will have the ability to control his or her profile and decide, at a granular level, what information (if any) is made visible to the public and to the Stanford CAP community. The interactive social networking environment will be entirely private within Stanford and information will not be shared on public sites or indexed by search engines. All individuals who use the system will be required to follow a Social Media Honor Code to ensure the privacy of our community.

Social networking paradigms are changing how we communicate and collaborate, both in our personal and work lives and have the potential to dramatically change how we deliver team-based patient care, conduct collaborative research, teach and support administrative functions. This project, lead by Senior Associate Dean Henry Lowe and Chief Technology Officer Michael Halaas, aims to support, explore and assess how this new social networking environment can enhance the ways we work together and ultimately support our core missions. It is anticipated that the new system will be available in early October of this year. Detailed information, training materials and demonstrations will be available later this summer.

The Power of Patients and Parents

As a pediatrician I have witnessed the impact of parent advocacy on diseases and problems that impact children. The passion, commitment and unwavering engagement of parents on behalf of their children can move individuals and institutions to new agendas and opportunities. In my own career these were particularly evident in the research and clinical agenda for children with cancer and also for those with HIV and AIDs. Of course advocacy is not restricted to children, as was well evidenced by the impact of advocacy groups, individuals and leaders on AIDS in the gay community. The impact on drug development, clinical trials and effect on those suffering from AIDS was notable and in many ways nonpareil.

In her latest and soon to be completed film entitled *Rare*, Dr. Maren Grainger-Monsen, Filmmaker in Residence and Program Director for Bioethics and Film, and her colleague Nicole Newham demonstrate the power of parents of children with a rare disorder called Hermansky Pudlak Syndrome, which includes albinism, a bleeding disorder and pulmonary fibrosis. By bringing to life the incredible commitment of Donna Appell, whose daughter Ashley suffered from this disease, filmmakers Grainger-Monsen and Newham take viewers into the devastating lives of the children and adults impacted by this rare disease -- and, equally importantly, how they and their loved ones and community literally changed the agenda for research and care. The long and often disappointing journey of clinical research is revealed -- but also the hope and compassion of parents, children and physicians and providers. We had the opportunity to witness this remarkable documentary in a film screening on July 13th in the Clark Center Auditorium. It was a moving experience.

Dr. Grainger-Monsen, her colleagues and the Stanford Center for Biomedical Ethics provide a unique resource for Stanford, the nation and world. Each of our lives is circumscribed by

experiences and events that cross our personal "known world." Through the art of filmmaking in areas that broach and explore important ethical and human illnesses and challenges, Maren extends and deepens our personal horizons and understanding. *Rare* is one of a number of exceptional films in her growing repertoire that now includes *Hold Your Breath*, *Worlds Apart*, *Vanishing Line*, *Grave Worlds* and *The Revolutionary Optimists*. I encourage you to view her website (<http://medethicsfilms.stanford.edu/>) and explore the insights she and her films offer to each of us.

Nominations for 2012 Faculty Fellows Program

The Office of Diversity and Leadership has announced the launch of the 2012 School of Medicine ***Faculty Fellows Program***. Now commencing its sixth year, the program will focus on a select group of Assistant and Associate Professors as Faculty Fellows for the 2011-2012 academic year. The purpose of the Faculty Fellows program is to identify and develop a diverse group of faculty with the potential to become our future leaders.

During the yearlong program, Fellows attend monthly dinner meetings with key University leaders including President John Hennessey, Provost John Etchemendy and Dean Philip Pizzo. Each speaker shares their "Leadership Journey" and engages fellows in a discussion about their leadership philosophy, strategy and style. In addition, Fellows participate in small monthly mentoring groups led by a senior Professor; and in a structured Career Development Planning process with their division chiefs or department chairs to craft a specific, career development action plan which the fellow will implement over the subsequent year.

If you are interested in being nominated for this opportunity, ask your Department Chair or Chief to nominate you. Criteria to apply:

- Assistant or Associate professors (***no less than 3 years in rank at Assistant and no more than 3 years in rank at Associate***)
- Demonstrated interest in, and potential for leadership
- Respected by colleagues
- Has the ability to influence others
- Can advocate for change
- Values diversity
- Thinks strategically and systemically
- Interested in taking on leadership roles in the future

Fellows are expected to attend all dinner meetings and mentoring group meetings. Below are the dinner meeting dates for 2012. All dinners are from 5:30-8:00pm.

- February 21, 2012
- March 20, 2012
- April 17, 2012
- May 15, 2012
- June 19, 2012
- July 17, 2012
- August 21, 2012

- September 18, 2012
- October 16, 2012
- November 20, 2012

You may obtain a nomination form via the ODL website at <http://med.stanford.edu/diversity/> or by contacting Jennifer Scanlin at jscanlin@stanford.edu.

Nominations are due by September 1, 2011. The new Fellows class will be announced in November 2011 and will begin meeting in January, 2012.

Call for Volunteers for Medical Education in Zimbabwe

Dr. Michele Barry, Senior Associate Dean for Global Affairs and Professor of Medicine, asked that I share this opportunity with you – and I am pleased to do so:

Starting in October there is an opportunity for Stanford faculty to teach overseas in Zimbabwe--

Basic science and clinical faculty as well as selected postdocs are invited to participate in a unique teaching partnership with the University of Zimbabwe medical school over the next 5 years funded by an NIH-MEPI grant called Novel Education Clinical Trainees and Researchers Program- (NECTAR) <http://globalhealth.stanford.edu/strategicinitiatives/nectar.html>

Both bedside teachers and preclinical lecturing are needed to teach in what was once a state-of-the-art teaching hospital in Harare, Zimbabwe affiliated with the University of Zimbabwe Health Sciences University encompassing the only medical school in the country. The economic crisis in Zimbabwe resulted in significant emigration of health professionals leaving only 39 percent of the medical faculty left and only 33 percent of doctor posts filled countrywide. This grant is an attempt to try to improve major gaps in preclinical and clinical training as well as in research mentorship by partnering with both Stanford and the University of Colorado.

- A minimum of two weeks teaching would be required but longer periods or sabbaticals are also welcomed.
- Airfare and housing would be provided.
- More details can be provided by Joce Rodriguez at Joce@stanford.edu

Awards and Honors

- **Dr. Arash Alizadeh**, Assistant Professor in the Department of Medicine (Oncology) is one of 16 physician-scientists nationwide to be named a recipient of a Doris Duke Clinical Scientist Development Award. This is a highly competitive and distinguished award that enables recipients to devote 75% of their time to research and hopefully help promote their careers physician-scientists. Please join me in congratulating Dr. Alizadeh (who is also a graduate of our School of Medicine's MSTP program). Congratulations, Dr. Alizadeh.
- **Dr. Maxence V. Nachury**, Assistant Professor of Molecular and Cellular Physiology, has just received the Early Career Life Scientist Award from the American Society for Cell Biology (ASCB). This award is given to an outstanding scientist who has served as an independent investigator for no more than 7 years. Congratulations, Dr. Nachury.

Appointments and Promotions

Natali Aziz has been reappointed to Clinical Assistant Professor of Obstetrics and Gynecology, effective 9/1/2011

Marina Basina has been reappointed to Clinical Assistant Professor of Medicine, effective 7/1/2011

Sylvie L. Blumstein has been reappointed to Clinical Assistant Professor of Obstetrics and Gynecology, effective 9/1/2011

Milana Boukhman has been reappointed to Clinical Assistant Professor of Surgery, effective 9/1/2011

Michelle M. Ferrari has been reappointed to Clinical Assistant Professor (Affiliated), effective 12/1/2010

Dominik Fleischmann has been promoted to Professor of Radiology at the Stanford University Medical Center, effective 7/01/11.

Michael E. Friduss has been reappointed to Clinical Associate Professor (Affiliated), effective 9/1/2011

Gregory H. Gilbert has been reappointed to Clinical Assistant Professor of Surgery, effective 9/1/2011

Heather Henri has been reappointed to Clinical Assistant Professor of Medicine, effective 9/1/2011

Andrea Jelks has been reappointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 7/1/2011

Rebecca L. McNiven promoted to Clinical Assistant Professor of Medicine, effective 7/1/2011

Leah S. Millheiser has been reappointed to Clinical Assistant Professor of Obstetrics and Gynecology, effective 7/16/2011

Stefan A. Mindea has been reappointed to Clinical Assistant Professor of Neurosurgery, effective 8/1/2011

Nancy Morioka-Douglas has been reappointed to Clinical Professor of Medicine, effective 9/1/2011

Christian Pariseau has been reappointed to Clinical Assistant Professor of Pediatrics, effective 8/1/2011

Suma D. Ramzan has been reappointed to Clinical Assistant Professor of Anesthesia, effective 9/1/2011

Lewis Shin has been reappointed to Assistant Professor of Radiology at the Veterans Affairs Palo Alto Health Care System, effective 2/01/12.

Ronald M. Witteles has been reappointed to Assistant Professor of Medicine at the Stanford University Medical Center effective 8/01/11.

Dean's Newsletter

August 29, 2011

A New School Year Begins: Welcome to the 2011 Incoming Class of Stanford MD Students
Today, August 29th, is the first day of classes for our 86 incoming MD students and five Masters in Medicine graduate students. It follows a week of preparation, bonding, transition, introductions and celebration – as well as enthusiasm and excitement (and of course some anxiety).

Last week these students began their introduction to medical school with backpacking and hiking in the Sierras in the SWEAT (Stanford Wilderness Experience Active Trip) program. They returned to campus to begin the “Transition to Medical School” on August 23rd. Special thanks to Lizzy George (SMS 2) and James Xie (SMS 2) who, along with nearly 30 other classmates, led this year’s SWEAT program – said to be one of the best ever. The “Transitions” program included a combination of informational sessions, shared experiences, moments of inspiration, social gatherings and new acquisitions. An important feature of the program addressed “Promoting Personal Wellness” and included two students, Marico Howe (SMS 5) and Danica Lomeli (SMS 4). In addition, for the first time, students visited various local health and community organizations to give evidence of our commitment to serving our communities. Special thanks to students James Xie (SMS 2) and Moises Gallegos (SMS 2) for their work in making these visits so successful. In addition to a lot of new information, our new students also received two “tools of the trade circa 2011”: an iPad and a stethoscope. Appropriately, there was considerable emphasis on how students should foster and support wellness in themselves and others and constant reminders of the central place of patients – and the role of doctors – in guiding the future of medicine, individually and collectively.

We are honored to welcome this stellar group of MD students, who were selected from a pool of 6,301 applicants. The overall demographic profile mirrors past years and reflects diversity and depth. Women comprise 53% of the class, and 19% of the incoming MD students are “underrepresented in medicine” minorities. Reflecting our global community, 15% of students were born outside the US, but the majority of their homes are on either the east or west coasts!

As evidence of their past accomplishments, 14 of our incoming MD students have a Masters degree in addition to a baccalaureate degree and four (4) have a PhD (one each in biomedical engineering, chemistry, neuroscience and music). Seven (7) students are entering the MSTP (MD/PhD) program, and I am confident that others will seek additional advanced degrees in the years ahead. Further evidence of the accomplishments of our new students is that 31% already have one or more peer-reviewed publications, 23% have conducted research or service in countries outside of the US, 14% participated in NCAA athletics and many have experience in performing arts as well. Quite a lot of talent! Most importantly, the commitment of our new students to embarking on a life journey in medicine and science gives hope for the future.

Special thanks to Char Hamada, Zera Murphy, Cindy Irvine, Suzanne Bethard, and all of our wonderful staff who worked so hard to welcome our incoming 2011 MD class and prepare them for the work they are now beginning.

The Stanford Society of Physician Scholars Celebrates Its First Anniversary

This month marks the first anniversary of the Stanford Society of Physician Scholars (SSPS), a new program created and directed by Charles G. Prober, Senior Associate Dean of Medical Education, and organized by Dr. Robert S. Ohgami (see: <http://ssps.stanford.edu/>). SSPS focuses on the scholarly development of residents and clinical fellows. The Society now includes 85 Scholars from 14 of our clinical departments – and we are hoping more will join over the course of this next year.

One of the goals of SSPS is to enhance partnership opportunities between medical students and Scholars. With that in mind SSPS is awarding \$5,000 research grants submitted by Scholars who have partnered with a medical student collaborator. The recipients of the first five of these grants are:

- **Dr. Brice Gaudilliere, Resident** in the Department of Anesthesia, and **Ryan Schubert, SMS 4**, for their grant entitled “*Single-cell analysis of molecular signaling pathways regulating opiate-induced immunosuppression in humans.*”
- **Dr. Kun Park, Instructor** in the Department of Pediatrics, and **Aaron Sin, SMS 2**, for their grant entitled, “*Health outcomes and economics of biologic therapies in inflammatory bowel diseases.*”
- **Dr. Ian Chen, Resident** in the Department of Medicine, and **Vinca Chow, SMS 4**, for their grant entitled “*Induced pluripotent stem cell-derived cardiomyocytes for the treatment of systolic heart failure.*”
- **Dr. Christina Khan, Resident** in the Department of Psychiatry, and **Alex Cardenas, SMS 5**, for their grant entitled “*Brain driver education: an innovative approach to teaching emotional self-regulation for teens.*”
- **Dr. Richard Gurgel, Fellow** in the Department of Otolaryngology, and **Cristen Olds,**

SMS 2, for their grant entitled, “*Neuroimaging of the auditory cortex with near-infrared spectroscopy to assess hearing in children.*”

Congratulations to these Residents, Fellows and students on beginning what we all hope will become increasingly fruitful interactions and collaborations between our undergraduate and graduate medical education programs.

The More Formal Beginning of a Different Transition

A year ago, in the August 30, 2010 issue of the Dean’s Newsletter, I announced my intention to transition from my role as Dean at the end of the 2013 school year (see: http://deansnewsletter.stanford.edu/archive/08_30_10.html#9). At that time I quipped that this meant about 68 more Newsletters. Since then 21 have been published (including this one) so we are down to 47 (or less, depending on timing!). More seriously, I want to say what an honor and privilege it has been to serve the School of Medicine, the Medical Center and University over the now nearly 10-½ years. I have always done my best to put the future of the School and its missions in education, research, and patient care first and foremost. And I do believe that we have together accomplished a tremendous amount over the past decade.

Now, with approximately two years remaining, I wanted to let you know that the Provost will be launching the search for my successor in the next weeks. On a national level searches and appointments for senior leaders (chairs and deans) take about 1 ½ - 2 years to complete.

While this will be an important transition for the School (and of course me) I am totally committed to doing everything I can to further our shared success – especially during these very challenging times. So you can count on my total commitment, energy – and additional Newsletters.

Another Warning on Violations of Privacy

Our Office of the General Counsel and our IT Services group in the School of Medicine have asked me to share the following statement with you – based on a recent apparent infraction of our privacy policy.

It is critical for each of us to remember that access to a patient's record is allowed solely for specific job-related need. Accessing for curiosity is a violation of federal and state law and will result in serious disciplinary action, up to and including termination, as well as possible government-imposed penalties. The State of California and the federal government are very actively enforcing privacy rights; as an example, in July UCLA paid \$865,000 to settle claims of employee snooping into celebrity and other patient records, according to a Department of Health and Human Services press release and related national media coverage (<http://www.hhs.gov/news/press/2011pres/07/20110707a.html>). Both the Lucile Packard Children's Hospital (LPCCH) and Stanford Hospital & Clinics (SHC) proactively monitor access to patient records, investigate any suspicious access, and, in coordination with the School, take strong actions in response to inappropriate access to such records. Please be advised about the seriousness of these policies and the penalties associated with violations

This is a topic others and I have commented on frequently and while there is ever increasing attention to privacy policies, violations still occur. When that happens the consequences will be severe – especially since these violations are clear - and unnecessary.

The Economy and Case for Supporting Research and Innovation

The now persistent economic downturn and the furious debates over our nation's debt and fiscal health have raised serious (and appropriate) worries about future investments in science and innovation. While these concerns impact all federal agencies supporting research, medical schools are particularly vulnerable to changes in funding from the National Institutes of Health. Indeed, we witnessed this vulnerability specifically from 2003 (the final year of the "NIH doubling") through 2009 – when NIH funding grew by less than inflation and the purchasing power of NIH grants declined significantly. While the pattern of declining support was altered temporarily by the stimulus funding through the American Recovery and Reinvestment Act of 2009, these two years of additional support have now ended, and future funding from the NIH appears likely to be flat for the foreseeable future. And of course this could get much worse depending on how the issues regarding the federal debt are resolved. Even though the NIH is one of the few federal agencies that have enjoyed bipartisan support, it is not immune to "across the board cuts" or to the current politics surrounding discretionary federal spending.

Even forgetting for a moment the impact of NIH support on our faculty and trainees, it is important to underscore how vital innovation and discovery are to jobs and economic recovery. A recent report from United for Medical Research notes that nearly a half-million jobs across the US are directly and indirectly supported by NIH funding. Overall, NIH funding produced nearly 70 billion dollars in new economic activity in 2010 – with impacts in all 50 states. Equally if not more importantly, over the past decades NIH funding has made the US the leader in biomedical research and has contributed to extraordinary progress in treating and improving the outcomes of nearly all major diseases impacting both adults and children.

In addition to our continued advocacy for NIH funding, there is another issue that warrants our concern. With increasing frequency leaders at the NIH and academic centers are focusing on the need for research funding to result in new treatments or cures. There is no question that this is an outcome we all desire. But the shift to link funding to defined outcomes is shortsighted and dangerous. Virtually every major advance in medicine has been built on basic research that had no clear application when it was conducted. Indeed the foundation of excellence in basic research is the very reason why our clinical and translational research portfolio exists today. We must do all we can to make certain that the pipeline of basic research – not linked to defined outcomes – is sustained and supported. From my perspective this advocacy is as important as that for research funding *per se* – and both are linked to the future of academic medicine and, in fact, the long-term success of the US in innovation, discovery and economic well being.

The Faces of the Stanford Medicine Community

Since moving to the Li Ka Shing Center for Learning and Knowledge in 2010, we have had numerous visitors to our offices. I appreciate the sensitivity and observations of several of those visitors who pointed out something that was clearly unintended – but nonetheless still striking. Specifically, the photo wall of the past deans of the School of Medicine displayed in the sitting area of the lobby on the third floor, while highlighting notable leaders in the history of Stanford Medicine, is also clearly defined by its lack of diversity. I won't offer excuses since this is part of our history, for better or worse, and I hope that it will be remedied over time by the diversity of future leaders of the School of Medicine. That said, we are also very proud of the fact that we

have one of the most diverse student populations and increasingly we celebrate the diversity of our faculty and staff. So, to demonstrate this breadth we have done some rearranging in the Dean's suite and now have a continuous photo show highlighting faculty, students and staff from throughout the School of Medicine. This photo show – which uses existing pictures and portraits – went live on August 26th and demonstrates the variety and depth of our extraordinary community. The photo library is a work-in-progress and new pictures will be added over time. I think it reflects our community more vibrantly and appropriately, and I am grateful to the individuals who offered comments to me.

I want to thank several individuals who have worked very hard to bring this project to fruition. In particular, Kristin Goldthorpe, Project Manager in Dean's Office, and Pam Lowney, Web Editor (Information Resources & Technology), as well as Traudi Sedelmayr (Facilities Planning and Management), Trent Tanaka and Brian Tobin (Simulation and Educational Technology), and John Stafford (Communications and Public Affairs), have done wonderful jobs – and I am most appreciative for their efforts.

New Regulations from the NIH on Conflict of Interest

On August 23rd, the Department of Health and Human Services released the “Final Rule” on changes to conflict of interest regulations regarding research. We are processing all of that it contains – but it is clear that the new regulations will place additional reporting requirements on faculty and institutions. While our systems at Stanford for managing, monitoring and reporting conflicts of interest are among the best in the nation, it is also clear that we will need to make further changes over the next year – when the rules become fully effective.

The new rules will mandate that all investigators supported by NIH have training on conflicts of interest. Institutions will need to ensure that information about financial conflict of interests is publicly accessible. Importantly, the new rules will require institutions to provide the NIH details about the nature of the conflict and the key features of the institutions management plan.

The Final Rules on the “*Responsibility of Applicants for Promoting Objectivity in Research for which Public Health Service Funding is Sought and Responsible Prospective Contractors*” is available in the Federal Register at: <http://www.gpo.gov/fdsys/pkg/FR-2011-08-25/pdf/2011-21633.pdf> and a table summarizing the major changes between those in 2011 and those of 1995 is available through the NIH at <http://grants.nih.gov/grants/policy/coi/>. We will be sharing more specific information in the future.

Dedication of “The Universal Woman”

Thanks to the vision and advocacy of Dr. Irv Weissman, Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine and the Virginia and DK Ludwig Professor, and a generous gift from Marlene and Duane Dunwoodie, longtime friends of the Institute, the dedication of “The Universal Woman”, a sculpture by Nathan Oliveira, was held in the lobby of the Lorry Lokey Stem Cell Research Building on August 25th. It was a deeply moving and meaningful event thanks to the thoughtful comments of Joe Oliviera, son of Nathan Oliveria, who died in 2010, and the remarks of Marlene Dunwoodie.

As noted by Irv Weissman, and poignantly described by Marlene Dunwoodie at the unveiling of “The Universal Woman”, the sculpture seems to represent a woman with a serious disorder whose outstretched arms beckon for help, care and support. This large bronze sculpture, which will be prominently visible to all who enter the Lokey Building, serves as a reminder of our mission – to discover and to cure.

Honoring Richard Hoppe, MD

On Friday evening August 26th, faculty, staff, friends and colleagues from the Medical School, hospitals and university – and from across the country – attended a special event honoring Dr. Richard Hoppe for his nearly 20 years as chair (including time as interim chair) of the Department of Radiation Oncology. The deep respect, admiration and gratitude of our community for the many contributions of Dr. Hoppe were evident and abundant – and very well-deserved.

Even though Radiation Oncology is a relatively small clinical department, its history and that of its leaders in advancing cancer research, education and patient care – and in advancing the mission of the medical school and medical centers – are well known internationally and highly respected. This history began with Dr. Henry Kaplan, who began as chair of the Department of Radiology in 1948 and who led the department (which combined diagnostic and therapeutic radiology) until 1972. He was followed by Dr. Malcolm Bagshaw, who continued this tradition and then participated in the separation of radiation oncology in 1986. Dr. Bagshaw served as the first chair of the new Department of Radiation Oncology. In 1992 Dr. Hoppe succeeded Dr. Bagshaw, first as interim chair and then, in 1994 as permanent chair. Over the past 19 years Richard Hoppe, the Henry S. Kaplan-Harry Lebeson Professor of Cancer Biology, has had a highly distinguished career at Stanford – as an outstanding clinician, thoughtful mentor and teacher and accomplished investigator. His leadership has not only been applicable to the Department – but also to the School and Hospitals, continuing the tradition established by Henry Kaplan.

Dr. Hoppe has been a faculty member of the School of Medicine for 35 years and he returns to the faculty on September 1st when Dr. Quynh Le, whom he helped train and mentor, succeeds him as Chair of Radiation Oncology. This is another success for Dr. Hoppe – and for the School, Medical Center and University.

Thanks and congratulations to Rich Hoppe – who we know will continue to contribute to Stanford for many more years to come.

Progress on Bike Safety – Hopefully

The importance of bike safety was highlighted by making it part of orientation for our new medical students this past week. This was championed by three now second year students, Anthony Kaveh, Sneha Shrestha and Nancy Yerkes – who have worked with Ariadne Scott (Parking and Transportation) to promote the use of helmets and lights by students in the medical school (see: http://deansnewsletter.stanford.edu/archive/05_09_11.html#1). Making the case even more relevant was a presentation by Dr. Mark Welton, Professor of Medicine, who recounted his own very serious bike accident and how his life was saved by wearing a bike helmet.

To promote bike safety, our new incoming students were invited to sign the Bike Safety Pledge for the School of Medicine. If you haven't done so already, visit the website (<http://transportation.stanford.edu/bikesafetypledge-som/>), sign the pledge and serve as a role model for bike safety. Dr. Welton's story makes it abundantly clear why this is so important.

The new insignia for Bike Safety from our medical students leaders is shown below and says it all!

Announcement About the Seventh Sino-US Conference

Dr. William Brody, President of the Salk Institute and Member of the Stanford University Board of Trustees, asked that we share the following announcement of the 7th Sino-US Conference on Medicine that will be held September 21-23, 2011 at the Salk Institute in La Jolla, CA (see: <http://sino-us-symposium2011.org/>). This meeting brings together experts in clinical medicine, basic science, hospital operations, and public health and policy around topics of mutual interest to the United States and China. This year's theme will focus on chronic illness and will cover topics from basic science to state-of-the-art diagnosis and treatment, as well as how to best organize healthcare delivery systems that are effective and affordable.

Awards and Honors

- **Scott Boyd**, MD, PhD, Assistant Professor of Pathology is a recipient of a "New Scholar Award in Aging" from the Ellison Medical Foundation.
- **Maureen Tedesco**, MD, Stanford/PAVAMC MIS Fellow, is the recipient of the Association of Women's Surgeons Outstanding Surgical Resident Award.
- **Sean P. David**, Clinical Associate Professor of Family and Community Medicine, is the 2011-2013 James C. Puffer, M.D./American Board of Family Medicine Fellow at the Institute of Medicine.
- **Stephanie Harman**, MD, Clinical Assistant Professor of Medicine, has been named the Arnold P. Gold Foundation Clinical Assistant Professor.

Congratulations to all.

Appointments and Promotions

Stephen Asch has been appointed to Professor of Medicine, effective 8/01/2011.

Dorsey Bass has been reappointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 11/01/2011.

Atul J. Butte has been promoted to Associate Professor of Pediatrics, effective 6/01/2011.

Alan Cheng has been reappointed to Assistant Professor of Otolaryngology, effective 10/01/2011.

Athena Cherry has been promoted to Professor of Pathology and of Pediatrics at the Stanford University Medical Center, effective 8/01/2011.

Lawrence Chu has been promoted to Associate Professor of Anesthesia at the Stanford University Medical Center, effective 8/01/2011.

Jeffrey A. Feinstein has been reappointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 11/01/2011.

Jennifer Hoblyn has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Veterans Affairs Palo Alto Health Care System, effective 8/01/2011.

Stephanie Jeffrey has been promoted to Professor of Surgery at the Stanford University Medical Center, effective 8/01/2011.

Richard Lafayette has been reappointed to Associate Professor of Medicine at the Stanford University Medical Center, effective 8/01/2011.

Michael V. McConnell has been promoted to Professor of Medicine at the Stanford University Medical Center, effective 8/01/2011.

Kari C. Nadeau has been promoted to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 8/01/2011.

David Peng has been appointed to Associate Professor (Teaching) of Dermatology, effective 6/01/2011.

Stanton B. Perry has been reappointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 10/01/2011.

Sylvia K. Plevritis has been appointed to Associate Professor of Radiology, effective 8/01/2011.

Elizabeth A. Price has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 8/01/2011.

Elif S. Selamet Tierney has been appointed to Assistant Professor of Pediatrics at the Stanford University Medical Center, effective 8/01/2011.

Alexander E. Urban has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences, effective 9/01/2011.

David Weill has been promoted to Professor of Medicine at the Stanford University Medical Center, effective 8/01/2011.

Dean's Newsletter September 12, 2011

An Important Message from Stanford Hospital and the Lucile Packard Children's Hospital About Assuring the Continuity of Patient Care

Among the many reasons underscoring the need for healthcare reform is confusion about the extent of coverage inflicted on patients by insurance companies - particularly when a patient is facing a serious medical need or challenge. Every individual facing a medical illness wants to know that they can receive the best possible care and treatment from an institution or physician whom they trust and value regardless of whether their healthcare costs are covered by public or private insurers. Confusion can arise when insurance companies are negotiating fees with hospitals and physicians - as is the case presently for both Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCCH). With the goal of informing patients (and their employers) that they will continue to receive care at SHC and LPCCH during the contract negotiations, the leaders from SHC and LPCCH have asked me to include in this Newsletter the message they are providing to patients and employers. The overarching goal is to assure patients that they are valued by our hospitals and medical staff and that they will not be abandoned or refused care and services. The message SHC and LPCCH are posting and sharing with patients and employers is as follows:

Stanford Hospital & Clinics is in contract negotiations with Anthem Blue Cross. Lucile Packard Children's Hospital is in contract negotiations with Anthem Blue Cross and also Blue Shield of California. During negotiations, both hospitals are still seeing patients who are insured with both of these health plans. All patients can continue to be seen regardless of their insurance benefit design, procedure or authorization status.

We encourage all patients and families with questions to call us at the following numbers: 1-877-519-6099 or 650-736-5998

We look forward to continuing to provide patients and families with our world-class care.

The School of Medicine Welcomes Back Ms. Martha McKee as Its Ombudsperson

We are delighted to announce that Martha McKee, former Ombudsperson for the School of Medicine, has rejoined the School in this role. Martha previously served as the School of Medicine Ombudsperson from December 1996 to June 2007, when she left Stanford to relocate with her family to Arizona. We are very pleased that she is now returning to the Bay Area and that we have the opportunity to have her back at the Medical School.

During her tenure at Stanford, Martha successfully managed the Office of the Ombudsperson for the School of Medicine, providing confidential and neutral problem solving expertise for faculty, post docs, students and staff in our competitive, complex and highly charged environment. She successfully mediated and facilitated the resolution of hundreds of disputes which otherwise might have involved the University and others in costly litigation. This position reports directly to the Dean of the Medical School and participates as a team member with the Office of the General Counsel and the School's Human Resources group in training and other programs designed to improve the climate of the Medical School.

Before being appointed Ombudsperson in 1996, Martha was employed by the Office of the General Counsel, Stanford University. She was assigned to the Risk Management Department where she served as an attorney for the Hospital and Clinics.

Martha holds a J.D. from Santa Clara University School of Law, and an A.B. from Smith College. She is a frequent speaker and trainer at conferences of The Ombudsman Association and the Smith College Club of the Peninsula. She is a member of the California State Bar and is a Certified Mediator.

We are delighted that Martha has returned to Stanford. She can be reached at her office in MSOB X301, phone 498-5744, and email at mmckee@stanford.edu

Please join us in welcoming Martha back to Stanford!

An Important Update on Housing Benefits for School of Medicine Clinician Educator Faculty

Medical School faculty who are in the Clinician Educator Line are extremely valued members of our community and are integral to our success as an academic medical center. Since the inception of this faculty line in the medical school in 2002 we have been seeking ways to make its members feel that they are important (I would add essential) to the mission of the Stanford Medicine. This is best evidenced by the work that these physicians do in the care of patients, the education of students and trainees, and in the participation of collaborative scholarship. At the same time, we have been quite aware that members of the CE line have not had access to some of the benefits available to other faculty, perhaps most notably housing benefits. With that in mind we have been working to remedy this for some time. I am pleased to say that a task force led by Dr. Ron Pearl, Richard K. and Erika N. Richards Professor and Chair of the Department of Anesthesia, has worked collaboratively and successfully on this issue with the Finance and Administration group in the Dean's Office, the leadership of Stanford Hospital & Clinics and the Lucile Packard Children's Hospital, the Provost's Office and the Stanford Faculty Housing Office. Based on their efforts I am pleased to announce the implementation of new housing assistance programs for eligible Clinician Educators at the rank of Clinical Assistant Professor, Clinical Associate Professor and Clinical Professor.

The new programs, which are intended to assist eligible CE's in their efforts to purchase a home in the local qualifying area, include the following:

1. The **Clinician Educator - Arranged** Mortgage (CE-AM) program is administered by the Stanford Federal Credit Union (SFCU). The maximum CE-AM loan, which is based on the lesser of 50% of the purchase price or 50% the appraised fair market value of a qualifying residence, is \$600,000. The payments on the CE-AM are fixed at interest

only for the first 5 years and adjust to both principal and interest in years 6 through 20 with a balloon payment due in at the end of year 20. This loan sits in second position behind a qualifying 1st mortgage loan that the CE can obtain from any mortgage lender.

2. The **Clinician Educator Deferred Interest Program** (CE-DIP) is a non-amortizing zero current interest loan with a deferred interest feature. The maximum loan amount, which is based on the lesser of 20% of the purchase price or 20% of the appraised fair market value of a qualifying residence, has been increased for Clinician Educators to a maximum of \$150,000 and is now the same as for Faculty. This loan would normally sit in third position behind a qualifying 1st mortgage loan that the CE can obtain from any mortgage lender, and after the CE-AM loan obtained from SFCU. Stanford University Faculty Staff Housing (FSH) administers the CE-DIP loan.
3. The **Clinician Educator Housing Allowance Supplement** (CE-HAS) is a taxable fringe benefit that provides additional compensation for first time home buyers within the qualifying area. The program, which is now the same as for Faculty, utilizes an academic 9-month salary, and is administered by Stanford University Faculty Staff Housing (FSH).

These programs are available to eligible Clinician Educators who are first time home buyers purchasing within the qualifying area applicable to Stanford housing programs. The home must be a single-family home, condominium or other dwelling unit suitable for housing one family. ***Prior to making an offer on a property for which the eligible Clinician Educator plans to use University housing programs, he or she must contact the Stanford University Faculty/Staff Housing Office to review his or her eligibility and to complete a loan application.*** Housing benefits are available to eligible Clinician Educators after eligible employment begins. Similar to the process for becoming pre-approved for a loan from a private mortgage lender, the Stanford University loan application, credit approval check and eligibility determinations must be planned for and completed well in advance of beginning the search for a home to avoid any complications. More information on these new programs, which are effective on September 1, 2011, is available on the Faculty Staff Housing website at <http://fsh.stanford.edu/CE/index.shtml>.

Stanford Physician-Scientists and Scholars Past, Present and Future

One of the distinctive features of Stanford Medical School is its commitment to the education, training and career development of physician-scientists and scholars. We have had the chance to witness the importance of this mission in the past couple of weeks through the historical portrait of a distinguished member of our faculty and by celebrating the contributions of present and future physician-scholars who are members of the Stanford Society of Physician Scholars along with those who are current medical students and alumni.

Thanks to the incredible efforts of Dr. Jason Gotlib, Assistant Professor of Medicine (Hematology), we had the wonderful opportunity to view a remarkable documentary film about Dr. Stan Schrier, Professor of Medicine (Hematology) Emeritus at Stanford entitled "The Mozart of Hematology" (see: <http://lane.stanford.edu/biomed-resources/medgrandrounds.html>). Stan Schrier has been a member of the Stanford faculty for 50 years - virtually for as long as the Medical School has been on the Stanford campus. This wonderful tribute not only reflects on the life and contributions of one of the giants in medicine to the field of hematology and science - but also provides a unique perspective into the changes that have taken place in medicine during

the past five decades and the important role that physician-scientists like Stan Schrier have had in contributing to the progress that has been achieved. I can't help but believe that such a story is inspirational to the new generation of students and trainees who will help further elucidate the scientific underpinnings of medicine and through their discoveries and innovations help create the future - even one that we can barely or not even imagine. This is what Stanford is about and is what makes us unique.

The Continuing Evolution of Interdisciplinary Research, Education and Patient Care

In December of 2002 we established the first of our Stanford Institutes of Medicine. Today we have five formal institutes (see: <http://med.stanford.edu/institutes/>), each of which is designed to bring together faculty, students and staff from across the university to address challenging and compelling questions that bridge our missions in education, research and patient care. In 2006 we further codified the organizational template and guidelines for the Stanford Institutes of Medicine (see: <http://med.stanford.edu/institutes/guidelines.pdf>), and in the years since then the Institutes have continued to evolve and shape our agenda in a number of important ways. Perhaps most importantly they have helped bring together broad communities of faculty and students across Stanford and, along with other initiatives like BioX (see: <http://biox.stanford.edu/>), have fostered a unique interdisciplinary and transdisciplinary environment that really distinguishes Stanford from nearly all of its peers.

Over the past two weeks three separate events or presentations have demonstrated how much interdisciplinary research has evolved at Stanford and how much this is contributing to translating discoveries with the goal of improving the care of adults and children.

First, on September 8-9, the Byers Eye Institute at Stanford and the Stanford Institute for Neuro-Innovation and Translational Neurosciences (SINTN) hosted a symposium on "New Approaches to Understand and Treat Vision Loss" that brought together faculty from throughout Stanford (and other centers) to address important themes in vision science, its loss and restoration. Themes from basic science, engineering, regenerative medicine, gene therapy and others were coupled with discussions on academic-industry relations, development of new therapeutics and translational medicine. The cross-dialogues and fertilization illustrated in a significant way the power of interdisciplinary science and medicine. I also quickly add that this symposium is a direct outcome of the vision of Dr. Mark Blumenkranz, Professor and Chair of the Department of Ophthalmology, who led the development of the Byers Eye Institute - along with the wonderful contributions from Brook Byers and his family that have made this initiative possible. The collaboration between the Byers Eye Institute and SINTN is further evidence of the evolution of interdisciplinary collaboration at Stanford (also see below).

In a separate effort, the Cardiovascular Institute (CVI) held its annual retreat on September 9th with over 150 faculty, students and trainees attending scientific presentations, poster discussions and interactive dialogues. Thanks to the leadership of Dr. Bobby Robbins, Thelma and Henry Doelger II Professor and Chair of the Department of Cardiothoracic Surgery and Director of the CVI, the Institute and its impact on the Stanford Medicine community have continued to evolve. Of particular note is the important strategic planning process that has helped shape the future of cardiovascular health at Stanford into a set of specific initiatives that link the School of Medicine and Stanford Hospital & Clinics. Perhaps most importantly, this plan brings together interdepartmental clinical services as well as research and education programs among cardiothoracic surgery, cardiology and vascular surgery - thanks to the shared leadership of Dr.

Robbins along with Dr. Alan Yeung, The Li Ka Shing Professor of Medicine and Dr. Ron Dalman, Walter Clifford Chidester and Elsa Rooney Chidester Professor of Surgery.

Finally, at the September 2nd meeting of the School of Medicine Executive Committee, Dr. Gary Steinberg, Bernard and Ronni Lacroute-William Randolph Hearst Professor in Neurosurgery and Neurosciences, Chair of the Department of Neurosurgery and Director of SINTN, provided an update on the status of the Institute. I include below Dr. Steinberg's summary of his presentation.

Update on the Stanford Institute for Neuro- Innovation and Translational Neuroscience

"SINTN was designated on October 1st, 2008 by Dean Pizzo to reorganize the Neuroscience Institute (NIS) at Stanford, which was created in 2003. The main goal for this newly formed Institute was to foster strong collaborations between the > 150 basic, translational and clinical neuroscientists at Stanford and enable translational efforts. We decided to focus on areas that present unique opportunities for development or expansion. We created five initiatives with two to three centers in each: Neural Plasticity and Repair, Neurodegeneration and Regeneration, Neurobiology of Cognitive and Developmental Disorders, Neuroengineering, and Neuroscience and Society. In all these areas we are aiming to advance our understanding of normal brain and spinal cord function and elucidate pathomechanisms underlying malfunction of the nervous system following injury or neurologic and psychiatric disease. A major mission of SINTN is to pioneer innovative techniques to manipulate the nervous system, with the ambitious goal of translating these new discoveries into novel therapies that improve quality of life for patients with CNS disorders over the next 5-10 years.

General highlights:

The institute has had a successful three years in terms of achieving its visions and goals thanks to the SINTN Executive Committee and a number of dedicated individuals who have worked diligently to accomplish this. We have secured over \$ 56 million in gifts and grants and have recruited 5 outstanding new faculty: Tom Sudhof (2008), Giles Plant (2010), Lu Chen (2010), Xinnan Wang (2011), Jun Ding (2011). We are in process of recruiting 3 additional faculty in the coming year in the areas of pain/addiction, behavior and vision. These recruits will comprise a unique, broad range of new expertise from molecules to neural circuits to behavior at Stanford. Moreover, we have created and supported 3 university core service centers in the areas of behavior, imaging and vector/virus production, as well as supported the MCP-SINTN Engineering Core, in order to sustain the key needs of our faculty. These core facilities have also have provided services to other institutes within the SOM and to other faculty in the university. We were awarded an NIH NINDS P30 center core grant (the first ever at Stanford) to help fund these cores over the next five years. These core facilities are supporting more than 200 projects each year and work leading to many high impact publications. Furthermore, SINTN has subsidized the Neuroscience Graduate Program (IDP), weekly seminar series, symposia and the annual Neuroscience retreat. SINTN has also provided three Neuro-Innovation fellowships (\$125,000/each) and for the first time supported the 3rd year neuroscience graduate students through SINTN Frances B. Nelson Predoctoral awards (22 students so far). Importantly, we have awarded 34 Faculty Neuro-Innovation Seed Grants across the university since 2008, to stimulate collaboration between basic and translational research areas.

Program highlights

- **Stanford Partnership for Spinal Cord Injury and Repair:** Dr. Giles Plant was recently recruited as the director of research in this new program, who has started to

establish multidisciplinary preclinical projects and the infrastructure necessary to execute translational studies. At the clinical level, we are one of 7 centers nationally participating in the Geron Phase I Trial using human embryonic derived oligodendrocyte precursor cell transplant in subacute complete spinal cord injury patients. We are also organizing an international spinal cord injury and repair symposium that will take place in 2012.

- **Vision and Blindness Prevention Center:** We have supported two symposia bringing nationally recognized vision scientists and clinicians together on the Stanford campus. We also were awarded for the first time an NIH NEI T32 Vision Research Training Program Grant (\$800,000/4 years) for postdoctoral fellows. We are currently launching a faculty search for a vision scientist.
- **Parkinson's disease and Movement Disorders Program:** This program has been supported by the Blume Foundation (\$2.8M) during the last 3 years. We have funded our faculty with numerous seed grants and have also recruited a new faculty member, Jun Ding, to join this team in 2012.
- **Pain and Addiction Program:** This program has supported three seed grants to our faculty in different departments. In addition, we are in the final phases of a search to bring a preclinical scientist to join our program.
- **Stem Cells, Tissue Engineering and Neurotransplantation Program:** This program, lead by Gary Steinberg, received a \$20 million CIRM grant to conduct preclinical development with human embryonic-derived neural stem cells for treatment of motor deficits following stroke. In addition, this program is currently supporting the Stanford/SanBio clinical trial as the first clinical trial in the U.S. to test intraparenchymal stem cell therapy for stroke patients.
- **Neuroengineering:** Our neuroengineering team is engaged in some very exciting and novel research. Krishna Shenoy and Jaimie Henderson's team was awarded a SINTN seed grant to support a clinical trial of their brain-computer interface for using neural signals from the brain to directly control external electronic devices, such as a computer cursor and robotic hand. This project plans to implant a quadriplegic patient in the next 3 months.
- **The Center for Compassion and Altruism Research and Education (CCARE)** applies rigorous scientific methods to define the neural basis for compassion and altruistic behavior. They have raised \$3.3 million in gifts and grants and have funded various projects throughout the university. Additionally they planned and sponsored a very successful 2-day international conference in 2010 on Compassion, Science and Society that included His Holiness the Dalai Lama. The Stanford
- **Interdisciplinary Group on Neuroscience and Society (SIGNS)** investigates the effects of the revolution in neuroscience on our society, beyond the strictly medical results, as well as the consequences for law, education, business, politics, and religion. A quarterly panel discussion series covers stimulating topics like Neuroscience in the Courtroom.

Significantly, the neurosciences at Stanford are united in its efforts. For the first time ever, various Stanford neuroscience groups including SINTN, Neuroventures (a Bio-X program), the Center for Neurobiological Imaging, the Clinical/Basic Science departments in the School of Medicine and across the University, as well as Stanford Hospital and Clinics and Lucile Packard Children's Hospital are working together towards common goals which we hope will be an important part of the final phase of the Stanford Challenge."

Taken together these efforts give evidence of the continuing evolution of interdisciplinary collaboration - which we all hope will benefit Stanford and serve our community, the nation and the world in the years ahead.

Preparations Begin for the Campaign for Stanford Medicine

At the September 2nd Executive Committee, Ms. Michele Schiele, Senior Vice President for Development, and I gave an update on the planning that is now underway for the Campaign for Stanford Medicine. We hope to begin this campaign at the start of 2012, as the Stanford Challenge winds down. Over the next months we will work with faculty, department chairs, institute and center directors and our new combined office of medical and hospital development to define the capital and programmatic goals we hope to achieve over the next 5-7 years. These will include such major projects as the support for Stanford Hospital as well as for School of Medicine facilities. Also included will be support for graduate and medical student education, faculty support and professorships, clinical program support and a number of important new initiatives. We are planning to coordinate this effort between the leadership of SHC and the School and to have more detailed discussions about it at our Strategic Planning Leadership Retreat in January 2012. Obviously lots more to follow.

In the meantime, the School of Medicine completed its FY11 fundraising efforts at the end of August and even with the current economic climate we demonstrated progress over FY10. There are various metrics that are used to assess the year-end results but here are some important ones:

- With an FY11 fundraising goal of \$140 million, we have raised (cash received) \$157,139,137 in the past year (112.2% of goal). This compares to the cash received in FY10 of \$124,208,231.
- In new activity we set a goal of \$160 million and as of August 31, 2011 we recorded \$157,169,814 (or 98.2% of the goal)
- Both cash received and new activity is significantly higher for FY11 than for FY10.

While this progress is notable, we believe we can do significantly better - especially now that we have the new joint development program combining SHC and SoM. Indeed, it is the expectation that both institutions will do much better united than apart - and that this new organization will serve the Medical Center and our community well during the years ahead.

Stanford Medical Center is Smoke Free - But So Are An Increasing Number Of Universities

In August 2007 Stanford School of Medicine became a smoke-free campus as part of its mission to promote the health and wellness of its community. This policy was extended to the Stanford Hospital & Clinics and the Lucile Packard Children's Hospital in 2008 and today the entire Medical Center is smoke free. But that is not the case for the rest of Stanford University. This is notable since an increasing number of colleges and universities (now more than 530 across the US) have adopted smoke free or tobacco free policies over the past several years (see <http://www.cnn.com/2011/HEALTH/08/31/smokefree.college.campus/>). While one can appreciate concerns about becoming too controlling and about infractions of choice and personal liberty, the evidence for diseases directly attributable to tobacco use is unequivocal and virtually unparalleled by other environmental risk factors.

We believe that the policy of the Medical Center helps promote health and wellness. One hopes that in time a similar policy will extend across the entire university - as it has in numerous colleges and universities in the US.

Celebrating the 2011 Dean's Medal Recipients

The contributions of Stanford Medical School to society begin with the creation of new knowledge and extend to discoveries and innovations that impact the lives of adults and children in health and disease locally and globally. While it is the creativity of scientists that initiates the process of discovery, novel work often requires support from donors that permits new ideas to become more viable candidates for sponsored competitive research funding. Increasingly this continuum extends to advocates and policy leaders who promote innovation in government funding for research and innovation. Without each of these essential ingredients, the US (and Stanford) could not sustain its leadership in innovation. This important continuum is well evidenced by the three distinguished individuals who received the 2011 Dean's Medal on Saturday, September 10th.

- ***Dr. CJ Huang*** has provided philanthropic contributions that have permitted important new research to be conducted in the School of Medicine, and the CJ Huang building will foster a community of excellence long into the future.
- ***Professor Stan Cohen's*** work has provided fundamental insights in how genes work and can be engineered and has spawned insights and discoveries that have directly affected the health of people in our community and worldwide.
- ***Representative Anna Eshoo*** has long been an advocate for scientific research and federal funding that enable outstanding discoveries to impact the US and world.

Each of the recipients of the 2011 Dean's Medal has made individual contributions of excellence to Stanford and our community and together they have helped Stanford improve the health of our nation and world. We are deeply appreciative of their efforts.

Thanks and Best Wishes to Dr. Kevin Tabb

Since Dr. Kevin Tabb joined Stanford Hospital & Clinics in 2005, faculty and leaders at the School of Medicine have developed a deep admiration and affection for him. He has won respect through his diligence and hard work in addressing with great integrity and transparency some of the most vexing problems of our medical center and of the rapidly changing face of healthcare. The range of his contributions include his important work in information technology that contributed significantly to the leadership role SHC now plays in the excellence of its Electronic Medical Record (EMR). His collaboration and commitment has also resulted in major improvements in SHC's quality and safety data - largely through his work with department chairs and faculty and with Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs. As the Chief Medical Officer at SHC, Dr. Tabb has been a thoughtful spokesperson for the work of physicians as well as Stanford's academic missions. In that regard he has served on a number of important search committees and has contributed thoughtful guidance and advice in a manner that garners respect and confidence. These skills have moved him into national prominence, which is now clearly evidenced by his selection to become the next President and CEO of the Beth Israel Deaconess Medical Center in Boston (see: <http://articles.boston.com/2011-09->

[07/business/30123694_1_stanford-hospital-and-clinics-medical-data-harvard-teaching-hospital](#)). Of course this is a great opportunity for Dr. Tabb, and, if past performance is any predictor for the future, he will do an outstanding job in Boston. He will be missed at SHC and Stanford and leaves an enduring impact on our Medical Center.

Please join me in congratulating Dr. Tabb and wishing him continued success.

Congratulations to the Stanford Center for Continuing Medical Education

Over the summer, our Stanford Center for Continuing Medical Education was informed by the ACCME (Accreditation Council for Continuing Medical Education) that they had attained not only full accreditation but Accreditation with Commendation. This outstanding accomplishment reflected the remarkable progress that has been made in our CME program in recent years under the leadership of Dr. Rob Jackler, Associate Dean for Postgraduate Education, and Terry O'Grady, Executive Director of the Center. Congratulations to Dr. Jackler, Ms. O'Grady and the entire CME staff for this wonderful achievement.

New Spectrum Website

Stanford has launched a new website that guides and supports biomedical researchers through the complex process of conducting translational and human-subject research studies. Developed by Spectrum, the Stanford Center for Clinical and Translational Education and Research, this online portal is part of an ongoing effort to streamline the infrastructure that supports this type of research across the university. Funded with the help of a Clinical and Translational Science Award from the National Institutes of Health, it represents an important milestone in the Spectrum team's mission to accelerate the flow of discoveries from university investigators to health practice.

Ripping a page from physician-scribe Atul Gawande's book, *The Checklist Manifesto: How to Get Things Right*, the website provides Stanford biomedical researchers with helpful to-do-lists for the four stages of running a clinical study -- design, set-up, management and close-out. Easy-to-follow lists provide researchers with online links to essential clinical trial resources, such as funding websites and custom online budget workbooks.

Within the Spectrum website, researchers also can access Study Navigator 2.0, a new release of Stanford's clinical trial project tracker and collaboration tool. Since its launch in March, the development team has folded in user feedback to enhance research team workflow, especially in the area of documentation management.

"The Spectrum website will ultimately be the front door to all of Stanford's clinical and translational resources, including a variety of CTR training programs and pilot funding opportunities supported by Spectrum. It will help investigators focus on the research, not the administrative overhead of running a study," said Harry Greenberg, MD, Spectrum's director

The new Spectrum website is available at <http://spectrum.stanford.edu/>

Awards and Honors

- **Karl Deisseroth, MD, PhD**, Associate Professor of Bioengineering and of Psychiatry and Behavioral Sciences, is the 2011 recipient of the W. Alden Spencer Lecture and Award. The Columbia University College of Physicians and Surgeons, the Department of Neuroscience, and the Kavli Institute give this award each year for Brain Science. Congratulations to Dr. Deisseroth.
Profile: http://med.stanford.edu/profiles/Karl_Deisseroth/
- **Phil Beachy, PhD**, Investigator, Howard Hughes Medical Institute Ernest and Amelia Gallo Professor, Stanford University School of Medicine Department of Biochemistry and Institute for Stem Cell Biology and Regenerative Medicine, is the co-recipient of the Keio Medical Science Prize 2011 for his work on the "Identification of Hedgehog, a key molecule in development, and its medical applications" (see: <http://www.ms-fund.keio.ac.jp/prize/>). This prize recognizes researches who have made outstanding contributions to medicine or the life sciences. Past recipients are enormously distinguished and Dr. Beachy well deserves to be among them. Congratulations to Phil Beachy.
Profile: http://med.stanford.edu/profiles/Philip_Beachy/

Appointments and Promotions

- **Sumaira Z. Aasi** has been appointed to Clinical Associate Professor of Dermatology, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Sumaira_Aasi/
- **Peter Barelka** has been promoted to Clinical Assistant Professor (Affiliated), effective 9/1/2011.
- **Sumit Bhargava** has been appointed to Clinical Associate Professor of Pediatrics, effective 10/1/2011.
- **Laura Brodzinsky** has been promoted to Clinical Associate Professor of Obstetrics and Gynecology, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Laura_Brodzinsky/
- **Alice Chiao** has been promoted to Clinical Assistant Professor of Surgery, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Alice_Chiao/
- **Cynthia L. DeTata** has been reappointed to Clinical Assistant Professor of Obstetrics and Gynecology, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Cynthia_Detata/
- **Shirit Einav** has been appointed to Assistant Professor of Medicine and of Microbiology and Immunology, effective 9/01/2011.
Profile: http://med.stanford.edu/profiles/Shirit_Einav/
- **Neal B. Frager** has been reappointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2011.
- **Michael Haberecht** has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Michael_Haberecht/

- **Michael Laufer** has been reappointed to Clinical Assistant Professor of Surgery, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Michael_Laufer/
- **James S. Lin** has been promoted to Clinical Associate Professor (Affiliated) of Surgery, effective 9/1/2011.
- **Robert M. Menard** has been promoted to Clinical Associate Professor (Affiliated) of Surgery, effective 4/1/2011.
- **Catherine A. Miller** has been promoted to Clinical Assistant Professor of Pediatrics, effective 1/1/2012
Profile: http://med.stanford.edu/profiles/Catherine_Miller/
- **Kapilkumar Patel** has been appointed to Clinical Assistant Professor of Medicine, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Kapilkumar_Patel/
- **Giles Plant** has been appointed to Associate Professor of Neurosurgery, effective 9/01/2011.
Profile: http://med.stanford.edu/profiles/Giles_Plant/
- **Gail A. Prichard** has been reappointed to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Gail_Prichard/
- **Elizabeth H. Raphael** has been promoted to Clinical Associate Professor of Surgery, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Elizabeth_Raphael/
- **Wendye R. Robbins** has been promoted to Clinical Associate Professor of Anesthesia, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Wendye_Robbins/
- **Joseph L. Ryan** has been promoted to Clinical Associate Professor of Surgery, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Joseph_Ryan/
- **Mary J. Sanders** has been reappointed to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 6/1/2011.
Profile: http://med.stanford.edu/profiles/Mary_Sanders/
- **Jodie A. Trafton** has been promoted to Clinical Associate Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 8/1/2011.
- **Jeffrey Young** has been promoted to Clinical Assistant Professor of Orthopaedic Surgery, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Jeffrey_Young/

Dean's Newsletter

September 26, 2011

Honoring the Life of Dr. Malcolm Bagshaw

Many of you no doubt have seen the sad announcement of the death of Dr. Malcolm Bagshaw, Professor of Radiation Oncology Emeritus
(<http://med.stanford.edu/ism/2011/september/bagshaw-obit.html>). Dr. Bagshaw was a pioneering

leader in Radiology and Radiation Oncology, and he had a major impact on Stanford and on medicine. He was deeply respected and revered by all who knew him and will be missed. A memorial service will be held on October 10th at 4:00 pm at Memorial Church.

A Tale of Two Cities: Gloom or Opportunity

Perceptions of reality can be affected by the coincidental juxtaposition of events. On September 14-15th I participated in a meeting of the Council of Deans and the Board of Directors of the Association of American Medical Colleges (AAMC) in Washington, DC. Not surprisingly, considerable portions of the meeting focused on the gloomy messages coming out of the Congress and Executive Branch about our nation's economic state of affairs and the changes likely to unfold as a consequence of fiscal reality and politics. The forecasts on healthcare financing are of course both promising and disconcerting. There can be no question that changes in our healthcare system and its financing are critical for the economic health of the US. At the same time there was considerable speculation about whether the debt reduction debate would impact Medicare and, more specifically, the support for Graduate Medical Education (GME) -- which would have a nearly immediate impact on academic medical centers and teaching hospitals specifically.

These possibilities came into sharper relief on Monday September 19th when President Obama delivered his debt reduction plan to the nation. While there were many important opportunities outlined in his message, one of the highlighted areas was to *"Reduce graduate medical education payments to better align with patient care costs: Medicare compensates teaching hospitals for the indirect costs stemming from inefficiencies created from residents' learning by doing." The Medicare Payment Advisory Commission (MedPAC) has determined that these Indirect Medical Education (IME) add-on payments are significantly greater than the additional patient care costs that teaching hospitals experience. This proposal would reduce the IME adjustment by 10 percent beginning in FY 2013, and save approximately \$9 billion over 10 years.* I have been concerned about the future funding for GME for a number of years and have written about this previously, so this is not surprising -- but it moves the financial impact on academic medicine from anticipation to reality and could be even more significant as the debt reduction debate continues.

Indeed, if the so-called Bi-partisan Congressional Committee of Twelve (six Democrats and six Republicans) does not meet its target budget reductions by the end of October (since whatever it proposes has to be reviewed by the Congressional Budget Office before the end of November deadline) even more significant cuts are likely. We have long known that the reimbursements for healthcare would decline -- it is just a question of time and the degree to which the major entitlement programs (Medicare and Medicaid) will be impacted. This now seems inevitable, in some manner and magnitude yet to be fully defined.

In tandem with the continuing bad news on the national and global economy, reports about the likely funding for the NIH for FY12 have also been a major area of interest -- and concern. On Tuesday, September 20th, the Labor-HHS-Education Subcommittee presented a possible NIH budget of \$30.5 billion -- which is a 0.6% decrease from FY11. Again, how this will play out is closely linked to whether the debt reduction committee noted above reaches its target cuts -- or whether across the board cuts go into place. If that default (or failure) option comes to pass, the negative impact on NIH funding could be much more significant for FY12.

There is no denying that the combination of the news on the economy, the prospect of declining federal support for research and the uncertain landscape for healthcare financing can easily promote a sense of gloom and foreboding --as was certainly the case in Washington. Having lived in the Greater DC area for more than two decades (while I was at the NIH) I am well versed in the siege mentality that can permeate Washington and have an almost anamnestic reaction to it. Thankfully, after the AAMC meeting I was able to return from Washington to Silicon Valley, the world's center for innovation, and by Saturday morning I was again full of optimism. This spirit of hopefulness and opportunity was strengthened by reflecting on what is so unique about Stanford and reinforced by attending portions of the *Stanford Medicine 2.0* meeting on Saturday morning.

The exciting program for *Stanford 2.0* (see: http://aim.stanford.edu/program_booklet_v3.pdf), organized by Dr. Larry Chu, Assistant Professor in the Department of Anesthesia, brought together thought leaders in innovation, technology, social media, medicine and more. The energy of the attendees conveyed optimism and hopefulness about prospects for creating the future rather than reacting to it. Of course, this is not to imply that the forces looming around us aren't serious and even daunting -- but it is also important to acknowledge that we need to find ways to recreate and redirect our efforts. I have long believed that Stanford Medicine should be a role model for the future -- and this is clearly the time to stay focused on how we can continue to develop and refine the work we have done over the past years to achieve that.

While hardly a guarantee of a successful future, both the School of Medicine and Medical Center are well positioned by virtue of their individual and collective financial resources. Our School of Medicine's consolidated endowment and reserves, as well as our annual operating surpluses, compare well to peer and national benchmarks and institutions. At our affiliated hospitals, the respective operating margins and annual profits, together with consolidated assets, reserves and investments also have a very solid foundation. Taken together -- and certainly compared to a decade ago -- we are in a very strong position. That said, we all recognize that no matter what our current resources, we will be challenged going forward given the economic downturn (now nearly four years old), the projected flat federal research funding and expected changes in our healthcare landscape. While our individual and collective financial resources are important, our human capital -- our faculty, students and staff -- is much more valuable. Over the past decade we have recruited over 600 full-time faculty (UTL, MCL, NTL), along with hundreds of Clinician-Educator faculty. Their talents and capabilities, individually and collectively, are exceptional by virtually any standard. The accomplishments and successes of our investigators top the list in peer-reviewed sponsored research funding per faculty as well as in comparative awards and honors per capita (including membership in the National Academy of Sciences, Institute of Medicine and the Howard Hughes Medical Institute) along with virtually any honor of note. While the stresses on our faculty are and will be notable over the years ahead, their creativity is even more so, which gives me great confidence that they will find and define new pathways to success, even during these days of constraint and even gloom.

Another source of institutional strength comes from a shared vision and from the increasingly closer alignments of our basic and clinical research community, including with colleagues across the university. Coupled with this are numerous interdisciplinary institutes and centers within the School of Medicine, along with some that extend across the university, and others that originate within the university and extend to the medical school. Also of major importance are the integration and partnership between the School of Medicine and our contiguously located teaching hospitals (Stanford Hospital & Clinics [SHC] and the Lucile Packard Children's Hospital [LPCH]) as well as with the Palo Alto Veterans Administration Medical Center and the

Santa Clara Valley Medical Center. These interrelationships have been enriched through multi-year strategic planning that has included shared missions in research, education, patient care and community service. These planning efforts have helped shape our School of Medicine and have continued to facilitate alignments with our hospitals and community.

As one example of patient care alignment, Christopher Dawes, President and CEO of the Lucile Packard Children's Hospital, recently shared three major decisions that were made at the September 7th LPCH Board of Directors meeting and that will impact LPCH and Stanford for many decades to come. The first was the approval by the Board for the \$1.13 billion hospital renewal expansion that will result in additional in-patient beds, diagnostic facilities and ambulatory space. Preparatory construction has begun, initially with infrastructure needs, and the LPCH leadership anticipates that the new facility will open around 2016, providing state-of-the-art facilities for children, parents and families -- and, of course, all who provide for their care and well-being. In tandem with new hospital facilities, the LPCH Board of Directors also approved moving forward with implementation planning for the conversion of hospital-wide information systems to Epic over the next 3-4 years. As you likely know, Stanford Hospital & Clinics, which has one of the most advanced electronic medical record systems in the nation, uses the Epic platform. This decision by LPCH to use Epic will create better alignments within the Stanford University Medical Center and will create additional opportunities for linking physicians within and outside of Stanford.

This decision directly relates to the third major approval by the LPCH Board of Directors, which is to continue to develop an interrelated physician network with the community, at LPCH, and with Stanford faculty and the School of Medicine. This provides a connection between LPCH/Stanford tertiary-quarternary clinical services and the broader linkage of primary and specialty services in the Bay area community and well beyond. These decisions, together with the major strategic planning that LPCH and Stanford have been doing over the past years, will position child health and obstetrics to be optimally configured for the major changes that will be unfolding over the next years. To the theme of this summary, even though many challenges abound, the bold and creative thinking and planning by our LPCH, pediatric and obstetric partners should enable Stanford to seize new opportunities and help create the future.

On September 21st, in further evidence of alignment and opportunity, Amir Rubin, President and CEO of Stanford Hospital and Clinics (SHC), offered an update to the SHC Board of Directors on the strategic planning efforts that have been taking place since his arrival in January of 2011. Equally important is the coordinated and integrated strategic planning between SHC and the School of Medicine that has also been underway. Institutional leaders, faculty and staff have broadly embraced these strategic planning efforts. Some build on programs that have been evolving over the past decade (e.g., our Stanford Institutes of Medicine), whereas others define new opportunities that will be jointly pursued in the years ahead. Taken together, these integrated strategic planning initiatives seek to define what makes the Stanford University Medical Center (SUMC) unique, in the complex medical care environment of the Bay Area and California but also on a national and global level. Because of our size and scope it is imperative that we measure and match our skills to achievable goals and objectives. As Amir Rubin noted during his presentation, this means being at the leading edge of both coordinated complex care and a coordinated network of care. We have particular strength in our ability to deliver leading edge complex care, but we have more work to do in optimizing its coordination.

The ways to achieve coordination in complex care are being explored and optimized in integrated planning efforts by leaders of the Stanford Cardiovascular Institute (the working

results of which were shared with the SHC Board of Directors on September 21st). Similar planning is now underway by the leadership groups of the Stanford Cancer Institute and the Stanford Institute for Neuro-Innovation and Translational Neurosciences Institute. Other integrated complex care planning (e.g., transplantation) will be initiated over the next year. Further, during an evening session with clinical department chairs and members of the SHC Board of Directors, the chairs described wonderful examples of alignment and accomplishment in coordinated complex care and/or in coordinated network of care. In these and related areas we recognize that we must achieve excellence and preeminence in discovery and innovation and in our physicians. We must also achieve leadership in quality, safety and evidence based patient care, in outstanding patient service and in the assessed value and lower costs of our clinical care enterprise. These metrics extend from our inpatient to our ambulatory services -- on the Medical Center campus and in our community.

We also recognize that we have challenges in being preeminent in the delivery of leading edge coordinated network care. We are making progress and are committed to excellence in this important area well. This includes our intent to expand the primary care physician services offered at SUMC and to develop innovative models for the delivery of patient care, such as the Ambulatory ICU developed by Dr. Arnie Milstein, who leads our Clinical Excellence Research Center. We fully anticipate that, over the next several years, strategic recruitments coupled with our burgeoning efforts in population sciences will help us become preeminent in improving the health of our community both locally and globally. Coupled with this are our important extensions to our community through the University Health Alliance (UHA), which is already creating important physician partnerships and which will serve as one of the bases for our network of care. These will be complemented by other creative opportunities -- including educating, training, and developing the physician workforce for the future of SUMC.

Of course, one of the most exciting developments and opportunities for the future of the SUMC will be construction and redevelopment of SHC -- a nearly \$2 billion initiative that is now underway. This will provide new facilities for patients and families along with new technologies and innovations that will extend from the operating room and the intensive care facility to the in-patient and outpatient facilities, where coordinated complex care and exceptional primary care will be delivered.

While the tone of the message from Washington is gloomy, and while challenges certainly abound, the opportunities to shape our destiny remain exceptional. We clearly need to be strategic in everything we do and to utilize resources and investments wisely and thoughtfully. Of course, we also need to make the case for new resources -- which we are doing as we plan for the launch of the Campaign for Stanford Health and Medicine early in 2012. The campaign will seek ways to support our facilities -- and perhaps most importantly our human capital: students, faculty and staff. While this will be a major effort that will take 5-7 years to complete, the campaign will help realize the compelling and exciting vision and goals that have been assembled over the past decade and the ones that will follow.

I do not mean to imply or suggest that we should be Pollyannish by not underscoring that the external pressures that we will surely face in the years ahead will require adaptation, adjustment and even modification of our plans. But I do very much mean to state that focusing on the negatives will mire us in being too reactive and cautious and, in some ways, will create a self-filled prophecy of stagnation. That is why I was glad to return from Washington to California -- and, even more so, why I am pleased to be at Stanford and to continue looking forward for opportunity and transformation.

Preparing For a Career as a Clinical and Translational Investigator

On September 13th I had the opportunity to introduce the Stanford Spectrum Intensive Course in Clinical Research (ICCR). This is a weeklong immersive and hands-on learning opportunity in the fundamental principles and practices that underpin clinical research -- from hypothesis to design, implementation and analysis. ICCR sessions have been held for postdoctoral fellows, junior faculty and staff and have benefited from the wonderful leadership and oversight of Drs. Steve Alexander, Professor of Pediatrics, and Phil Lavori, Professor and Chair of the Department Health Research and Policy. They are sponsored by Spectrum (<http://spectrum.stanford.edu/>) and, in this latest offering by Spectrum Child Health (<http://spectrumchildhealth.stanford.edu/>). The most recent program focused largely on clinical fellows in pediatric medical and surgical specialties. We hope, of course, that many of these trainees will pursue careers in academic medicine. However, regardless of what pathway they pursue, further grounding in science along with analytic and critical reasoning skills will make them better practitioners and more thoughtful users of evidence based medicine.

In reflecting on the ICCR program -- especially within the context of the challenges that impact younger colleagues who seek to transition from fellowship to faculty positions, I found it easy to imagine how daunting the process can seem -- especially with the increasing concerns about funding for research and the demands of the changing healthcare landscape as described above. The road ahead for each is an individual journey, but it is also important to take note of some of the resources and opportunities that exist at Stanford to help bridge the apparent divides and foster continued success. It might be helpful to convey a few of these along with some caveats and observations.

First, I would encourage clinical and postdoctoral fellows who are contemplating academic careers (although these comments and resources are certainly useful for other career pathways) to refine and enhance their knowledge about and skills in clinical research in every way possible. Of course the ICCR course is one way to do that. A weeklong course, however, is really just a table of contents, and it is important to complement or supplement this introduction with additional training and education. This might include an additional degree, which could be a Masters in Epidemiology or in Public Health or Public Policy or in Business. These programs are available at Stanford -- or in the case of the Masters in Public Health, in collaboration with the University of California at Berkeley. Some clinical fellows may wish to have more grounding in science, in which case a PhD might be an important adjunct. Opportunities to pursue the PhD are available through the Advanced Residency Training at Stanford or ARTS program (add <http://med.stanford.edu/gme/programs/arts.html>). Fellowships in Biodesign (see <http://biodesign.stanford.edu/bdn/index.jsp>) and shared experiential learning about drug development and clinical trials through the SPARK program (<http://biodesign.stanford.edu/bdn/index.jsp>) are also available.

One of the most important routes to success for fellows is making sure they have a faculty mentor -- and ideally someone who is helping with their career development in addition to providing guidance on their research. One's division chief and department chair should be able to facilitate mentoring relationships. In addition, the increasingly robust online CAP (Community Academic Profiles) system (<http://med.stanford.edu/profiles/>) allows connection of faculty and students with similar interest areas and is another great tool. Shortly CAP will be further enriched to foster social networking within the Stanford community and will offer novel ways of creating a learning, collaborating and mentoring community.

For the pediatric community, Dr. Christy Sandborg, Chief-of-Staff at LPCH and Professor of Pediatrics, has developed a successful and greatly appreciated Pediatric Mentoring Program (<http://spectrumchildhealth.stanford.edu/>). Mentorship and collaborative research efforts can also be extended from postdoctoral fellows to residents and medical students through the Stanford Society for Physician Scholars (see <http://ssps.stanford.edu/>). In addition, numerous leadership training opportunities are available through LPCH as well as through the School of Medicine's Office of Diversity and Leadership (see <http://med.stanford.edu/diversity/>) led by Dr. Hannah Valantine, Senior Associate Dean and Professor of Medicine.

Another important network exists through our Stanford Institutes of Medicine (<http://med.stanford.edu/institutes/>) and Centers (<http://med.stanford.edu/programs/>), many of which provide learning and research communities across the basic and clinical sciences, nearly always with extensions across the university. Fellows should seek ways to join these communities, virtually all of which offer seed grants designed to bring novel investigative groups or teams together. Importantly, these seed grants (which extend across the university, including BioX [see: <http://biox.stanford.edu/>]) have an enormous leveraging impact and often provide a path to sponsored research funding. Special opportunities for research funding in pediatrics are available through the recently established Child Health Research Institute (CHRI). Under the leadership of Dr. Hugh O'Brodovich, Arlene and Pete Harman Professor and Chair of the Department of Pediatrics, CHRI offers a number of fellowships to physician scientists in training (<http://spectrumchildhealth.stanford.edu/chri-awardsandgrants.html>).

Postdoctoral training and clinical fellowships offer unique opportunities to probe deeply into a clinical discipline or research project. However, they can also be somewhat isolating and can, on occasion, lead fellows to lose sight of the much larger web of opportunities and resources at an institution like Stanford. The ICCR creates a new learning and collaborative community -- but it is important that it be complemented with other supports and services. A faculty member who serves as mentor and career advisor is certainly central to one's personal success-- but there are many other opportunities, some noted in this brief review, that are available at Stanford and that can make a difference in one's career pathway.

Some Great News from the NIH

One of the concerns about constrained funding is that agencies become more conservative in their awards, taking fewer chances on high-risk proposals. This is unfortunate since it stifles the most creative research and runs the risk of fostering narrower thinking. That is why the NIH Pioneer Awards and the Director's Awards for New Innovators and for Transformative Research Projects are so important -- to investigators and to science more broadly.

On September 20th the NIH announced the 79 recipients of the NIH Directors Awards, including 13 Pioneer Awards, 49 New Innovator Awards and 17 Transformative Research Project Awards (see: <http://www.nih.gov/news/health/sep2011/od-20.htm>). Five Stanford University faculty are among this year's recipients, four of whom are in the School of Medicine (including Bioengineering). This year's Stanford recipients include:

NIH Pioneer Award

- **Dr. David Schneider**, Associate Professor, Department of Microbiology & Immunology

New Innovator Award

- **Dr. C. Jason Wang**, Acting Associate Professor, Department of Pediatrics

Transformative Research Project Award

- **Dr. Kwabena Boahen**, Associate Professor, Department of Bioengineering
- **Dr. Jody Puglisi**, Professor and Chair, Department of Structural Biology

Since the inception of these awards in 2004 Stanford faculty have competed extremely for them - and have been awarded quite a disproportionate share of the total. This is further testimony to the creativity and innovative spirit of our faculty -- one of Stanford's greatest treasures.

Berry Postdoctoral Fellowships in Children's Health Selects its 2011 Recipients

I am pleased to announce that the Office of Postdoctoral Affairs has selected three postdoctoral scholars to be the 2011 recipients of the prestigious Berry Postdoctoral Fellowship. This fellowship program has been made possible through the generosity of Walter and Idun Berry. The Berrys' legacy has been continued through the commitment and dedication of their closest friends and the Berry Foundation Board of Trustees, whose support of the program provides \$55,000 in annual stipend and \$5,000 research allowance to three new fellows per year for up to three years of support. Dr. Mark Kay, Dennis Farrey Family Professor in Pediatrics and Professor of Genetics, has served as the chair of the selection committee, and we are indebted to him and his colleagues for their efforts on behalf of the Berry Foundation.

The 2011 Berry Postdoctoral Fellowship winners are

- **Xuecai Ge** (PhD, Harvard Medical School, 2009). Project Title: *"A New Approach to Inhibiting Pediatric Tumor Growth: Control of Hedgehog Signal Transduction by Neuropilins"*. Faculty Mentor: Dr. Matt Scott, Professor, Department of Developmental Biology.
- **Roosbeh Kaini** (PhD, University of Washington School of Medicine, 2009 and MD Shaheed Beheshti University School of Medicine, Iran, 2002). Project Title: *"Choice Certainty as a Window Into Autism"*. Faculty Mentor: William Newsome, Professor, Department of Neurobiology.
- **Nan Yang** (PhD Stanford University School of Medicine, 2011). Project Title: *"Direct Reprogramming of Fibroblasts into Oligodendroglial Cells."* Faculty Mentor: Marius Wernig, Assistant Professor, Department of Pathology.

Congratulations to Drs. Ge, Kaini and Yang.

Awards and Honors

- **Palo Alto University**, with whom our Department of Psychiatry and Behavioral Sciences offers the Psy.D. degree in a consortium arrangement, has been awarded the American Psychological Association's Board of Educational Affairs Award for Innovative Practices in Graduate Education in Psychology. They are receiving this award based on the

revision of their PhD curriculum to include an emphasis on diversity and community mental health. *Congratulations to our Palo Alto University colleagues.*

- **Dr. Michael Fredericson**, *Professor of Orthopaedic Surgery*, will receive the 2011 Physiiatric Association of Spine, Sports, and Occupational Rehabilitation Legacy and Lectureship Award, one of the highest honors of the American Academy of Physical Medicine and Rehabilitation, is given to an individual who has advanced the field of musculoskeletal physiatry through clinical care, education, service and scholarship. *Congratulations to Dr. Fredericson.*
Profile: http://med.stanford.edu/profiles/Michael_Fredericson/
- **Jenna Caldwell**, *a first year graduate student in the Department of Biochemistry*, has been selected as the newest Donald E. and Delia B. Baxter Foundation Graduate Fellow. She joins Tony Tsai, MD, as the two graduate fellows generously supported by the foundation. *Congratulations to Jenna Caldwell.*
- **Dr. James Chang**, *Professor and Chief of Plastic & Reconstructive Surgery*, was recently awarded the 2011 Andrew J. Weiland Medal for Outstanding Research Achievement at the annual American Society for Surgery of the Hand meeting. The award honors a mid-career surgeon-scientist for a body of work that advances the field of hand surgery. *Congratulations to Dr. Chang.*
Profile: http://med.stanford.edu/profiles/James_Chang
- **Dr. Phil Lavori**, *Professor (Biostatistics) in the Department of Health Research and Policy at Stanford University*, is this year's recipient of the Harvard Award in Psychiatric Epidemiology and Biostatistics. The award recognizes Professor Lavori's lifelong career contributions that have significantly advanced the field of Psychiatric Biostatistics. Professor Lavori will present the award lecture at the Harvard School of Public Health on Wednesday, April 11, 2012. *Congratulations to Dr. Lavori.*
Profile: http://med.stanford.edu/profiles/Philip_Lavori/

Appointments and Promotions

- **Meredith Barad** has been promoted to Clinical Assistant Professor of Anesthesia and of Neurology & Neurological Sciences, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Meredith_Barad
- **Linda K. Barman** has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 6/1/2011.
- **Colleen Caleshu** has been appointed to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 8/1/2011.
- **Howard Chang** has been promoted to Professor of Dermatology, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Howard_Chang
- **Cheryl Cho-Phan** has been reappointed to Clinical Assistant Professor of Medicine, effective 5/1/2011.
Profile: http://med.stanford.edu/profiles/Cheryl_Cho-Phan
- **Nicolette M. Chun** has been appointed to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 8/1/2011.
- **Tara Cornaby** has been promoted to Clinical Associate Professor of Anesthesia, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Tara_Cornaby

- **Heather T. Cousins** has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 7/1/2011.
- **Shirit Einav** has been appointed to Assistant Professor of Medicine and of Microbiology and Immunology, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Shirit_Einav
- **Louise K. Furukawa** has been promoted to Clinical Associate Professor of Anesthesia, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Louise_Furukawa/
- **Alan Glaseroff** has been appointed to Clinical Professor of Medicine, effective 11/1/2011.
- **Alpana R. Gowda** has been promoted to Clinical Assistant Professor of Anesthesia, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Alpana_Gowda
- **Jonay N. Hill** has been reappointed to Clinical Assistant Professor of Anesthesia, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Jonay_Hill

Dean's Newsletter

October 10, 2011

Welcome to the 2011 Bioscience Graduate Students

On Friday evening, September 30th, the Second Annual White Lab Coat Ceremony was held in Berg Hall of the Li Ka Shing Center for Learning and Knowledge (LKSC). This event is sponsored and coordinated by Stanford University Medical Center Alumni Association, and the goal is to promote a spirit of community and connectivity with our incoming PhD and Masters students. Stanford Medical School is unique in having nearly equal numbers of MD and PhD students (with lots of dual degree students), which is something worth celebrating in its own right. We are also fortunate in having outstanding PhD students who play an incredibly important role in contributing to the rich and creative scientific environment that defines Stanford. And while "traditions" do not have deep roots in the Stanford culture, it is great to have the White Lab Coat Ceremony for PhD students joining the Stethoscope Ceremony for MD students as a welcoming tradition in the School of Medicine.

I want to thank Dr. Jessica Linderman, who received her PhD in Immunology in 2010, for her thoughtful comments and recommendations to the incoming students, which were based on her experience as a recent graduate student and leader. Equally I want to thank Jessica for reminding students to wear bike helmets "to protect their most important asset and investment." That message is important and much appreciated.

The 108 incoming bioscience PhD students and 34 new Masters students began official orientation and classes on September 26th with an orientation panel, graduate student poster session and welcome dinner on the Alumni Green in front of the LKSC. Of course, "bonding and community building" began days earlier with a backpacking and hiking trip in Henry Coe State Park. These events were made possible through the hard work and dedication of Louis Fernandes, President of the Stanford Biosciences Student Association (SBSA). Sarah Carden served as this year's orientation chair, and Jillian Lund, Gandhi Pierre-Louis, Lauren Smith, and Gloria Yiu participated in the orientation panel. Sharon Briggs and Justin Smith served as coordinators of the hiking trip. Our special thanks go to each of these student leaders as well as to the many student volunteers who made the orientation and camping trip so successful.

The 2011 incoming class of bioscience students is diverse and has exceptional academic credentials. They were selected from a pool of 1598 applicants submitting a total of 3731 applications (applicants can apply separately to one or more departments or programs). Women comprise 45% of the class, and 16.4% of the incoming PhD students are underrepresented minorities. Reflecting our global community, 13% of the students were born outside the US in twelve different countries. Those born in the US come from 29 different states. Our students come from 63 different undergraduate schools, with four or more coming from each of the following: Arizona State University, Harvard University, Princeton University, Stanford, University of California, Berkeley, University of California, San Diego, University of Pennsylvania, and Washington University. Of note, 18 of these students already have advanced degrees: one MBA, one MFA, one Master of Engineering, 12 MS degrees, one MD, and two Doctors of Veterinary Medicine.

The home programs extend across three schools (Medicine, H&S and Engineering) and include departmental as well as interdisciplinary programs. The number of students in a

program/department ranges from "large" in the case of Biology (with 23 students) to small (with three students each in Chemical & Systems Biology, Molecular and Cellular Physiology, and Structural Biology). The 34 Masters students joining us are matriculating in Bioengineering, Biomedical Informatics, Epidemiology, Genetic Counseling, and Health Services Research.

I also want to extend special appreciation to Dr. Dan Herschlag, Professor of Biochemistry and new Senior Associate Dean for Graduate Education and Postdoctoral Affairs. Dan stepped right in to be a master of ceremonies as well as a committed champion for graduate education. Also special thanks to Zera Murphy, Suzanne Bethard, and all of our wonderful staff who worked so hard to welcome our incoming graduate student class and prepare them for the journey they have now commenced.

More on the Career Paths for PhD Graduates

Over the past year we have had a think tank, follow-up discussions and a strategic planning retreat discussion about the future of graduate education in the biosciences, focusing specifically on the appropriate size of PhD programs and even more importantly, whether we are adequately preparing students for the broad array of careers they might pursue - in academia, industry, education and beyond

(see: http://deansnewsletter.stanford.edu/archive/01_24_11.html#1, http://deansnewsletter.stanford.edu/archive/10_11_10.html#3,

and http://deansnewsletter.stanford.edu/archive/07_05_11.html#2. As we await the conclusions and recommendations of the current NIH Biomedical Workforce Taskforce, which we hope will agree that we are not educating too many PhD students in the biosciences, it is also worth noting a recent report from UCSF entitled *"Improving Graduate Education to Support a Branching Career Pipeline: Recommendations Based on a Survey of Doctoral Students in the Biomedical Sciences"* (see Fuhrmann, CN, Halme, DG, O'Sullivan, PS, and Lindstaedt, B in the on-line journal CBE-Life Science Education - <http://www.lifescied.org/content/10/3/239.full>). In their essay Fuhrmann et al note prior data (albeit sparse) demonstrating that since 2001 less than 20% of PhDs in the biosciences have taken tenure-line academic positions - which may be declining on a national level - whereas 43% of graduates are employed in non-academic settings (23% in industry, 9% in government, 11% in other settings).

These observations comport with a report I commented on in the October 6, 2008 issue of the DNL (see: http://deansnewsletter.stanford.edu/archive/10_06_08.html#2) where I noted *the interesting Science Focus article "And Then There Was One" that appeared in the September 19th issue of Science (see: <http://www.sciencemag.org/cgi/content/full/321/5896/1622>). This article reviewed the individual career pathways of the 30 students who entered the program in molecular biophysics and biochemistry (MB&B) at Yale in 1991. Of the 26 who completed their PhD, the startling conclusion is that only one is a tenured faculty member today, although one other graduate of the program is in a tenure track position, four are in academic research positions, and one each is in academic teaching or administrative positions. Of the 18 students who did not pursue or stay in academia, 11 are in bio-industry and four are in other career paths.*

Understandably, when such data are shared among faculty at the most research-intensive schools - which certainly include places like UCSF and Stanford - it is commonly assumed by faculty at such institutions that these data don't reflect "our reality." But perhaps, rather than attempting to assess the accuracy of that assumption, it is equally important to ask how many graduates pursue

research careers whether in academia or other settings and how do choices and decisions change over the course of graduate school and beyond.

While longitudinal data would be more accurate, Fuhrmann provides cross-sectional data on 469 bioscience PhD students at UCSF who responded to a questionnaire about their career plans in 2008. This represented a 62.3% response rate of all the basic bioscience students at UCSF at that time. Based on this cross-sectional analysis, the authors reported that 81% of year 1 graduate students planned a career in research. This compares to 66.7% of graduate students in year 6 and higher - with the greatest transition taking place between years 2 to 3 in this cross-sectional survey. Whereas 41.7% of year 1 students indicated a plan to be a Principal Investigator at a research-intensive academic institution, this number fell to 25.6% in the year 6 or higher students who were surveyed. Interests in other career paths - including teaching and non-research careers - rose from year 1-6 and beyond. Obviously there are limitations in this type of survey, but they offer observations that are generally consistent with what our students have shared in various settings in recent years. While it is certainly possible that the data at Stanford could be different (and we need those data), chances are likely that similar - or, more importantly, longitudinal - surveys would yield similar observations among our own students. Given the funding challenges for the biosciences in the years ahead, it is reasonable to expect that these trends will continue or even become more significant.

The point of sharing these data with you is not to debate whether our students are more committed to academic careers than those at other institutions. Rather it is to continue refining our dialogue. We all need to be thoughtful and analytic about whether we are providing a broad and sufficient education that matches students' goals - as they evolve over time. It is also important to move beyond the view that pursuing a non-academic research career is the failure mode. Quite to the contrary, it seems important to develop education programs that foster and enhance career opportunities - in the various diverse paths they take. Doing so could enrich our institutional competitiveness for the most talented bioscience graduate students in the future. While there is not an immediate solution or recommendation, these considerations will be part of the curriculum review that Dr. Tom Clandinin, Associate Professor of Neurobiology, and Dr. Dan Herschlag, Professor of Biochemistry and Senior Associate Dean for Graduate Education and Postdoctoral Affairs, are now pursuing. Updates of their progress will be a topic for discussion at the next Strategic Planning Leadership Retreat in January 2012. Hopefully this process will help frame how Stanford proceeds with graduate education in the biosciences for the years ahead.

The National Science Foundation and the White House Promote Work- Family Balance

On September 26th, the White House and the National Science Foundation (NSF) announced a ten-year plan entitled the NSF Career-Life Balance Initiative to "provide greater work-related flexibility to women and men in research careers." The press release notes data that we have discussed previously - namely, that currently 41% of PhDs in science, technology, engineering and mathematics (STEM fields) are women but that women comprise only 28% of tenure track faculty in these fields. This has been a topic of major concern at many institutions, including Stanford, and it prompted the creation nearly seven years ago of the Office of Diversity and Leadership in the School of Medicine (see: <http://med.stanford.edu/diversity/>), which is led by Dr. Hannah Valentine, Senior Associate Dean and Professor of Medicine. Over the years Dr. Valentine and her colleagues have created a number of programs and opportunities to enhance career development and diversity, many of which are already addressing the important issues

now being highlighted by the White House - NSF initiative. In that initiative, the NSF highlighted following issues:

"Allow postponement of grants for child birth/adoption - Grant recipients can defer their awards for up to one year to care for their newborn or newly adopted children.

Allow grant suspension for parental leave - Grant recipients who wish to suspend their grants to take parental leave can extend those grants by a comparable duration at no cost.

Provide supplements to cover research technicians - Principal investigators can apply for stipends to pay research technicians or equivalent staff to maintain labs while PIs are on family leave.

Publicize the availability of family-friendly opportunities - NSF will issue announcements and revise current program solicitations to expressly promote these opportunities to eligible awardees.

Promote family-friendliness for panel reviewers - STEM researchers who review the grant proposals of their peers will have greater opportunities to conduct virtual reviews rather than travel to a central location, increasing flexibility and reducing dependent-care needs.

Support research and evaluation - NSF will continue to encourage the submission of proposals for research that would assess the effectiveness of policies aimed at keeping women in the STEM pipeline.

Leverage and expand partnerships -- NSF will leverage existing relationships with academic institutions to encourage the extension of the tenure clock and allow for dual hiring opportunities."

Hopefully other funding agencies, including the NIH, will adopt similar strategies and initiatives. These changes, if implemented, could have an important impact on the shared goals of improving faculty success, particularly for women in STEM fields. Complementing these initiatives with the programs now in place or being planned by Stanford's Office of Diversity and Leadership should help to improve career opportunities for women in science and medicine. This is one of our most important initiatives in the medical school, and the public-private partnerships that could be formed to facilitate it could be transformational. That would be wonderful for the future of enriching and enhancing diversity at Stanford.

Office Of Academic Affairs To Sponsor Faculty Workshops

One of the most important goals of the School of Medicine and of the Office of Academic Affairs (OAA) is to provide a supportive environment that enables faculty to succeed and flourish in their clinical, teaching and research activities. While this is important for all stages of career development and evolution, it is particularly true for assistant and associate professors facing the pivotal milestone of reappointment or promotion.

To optimize faculty career development, over the past two years the Office of Academic Affairs (OAA) has sponsored a series of workshops aimed at demystifying reappointment and promotion criteria, policies and processes. Over 200 faculty members have attended these sessions, which have covered topics ranging from preparation of the curriculum vitae and candidate's statement to the evaluation of clinical excellence to rank- and line-specific criteria for reappointment and promotion.

During the current academic year, OAA will sponsor eight workshops for faculty in the University Tenure, Medical Center and Clinician Educator Lines. The first session is designed for Clinical Assistant Professors and is entitled *"Preparing for the Promotion Review."* It is

scheduled for November 16 and will be led by Dr. Maurice Druzin and Dr. Nancy Morioka-Douglas, Chair and Vice Chair, respectively, of the Clinician Educator Appointments and Promotions Committee.

The second session is designed for assistant professors in the Medical Center Line, also on November 16, and will focus on *"Building a Regional Reputation: Preparing for Promotion to Associate Professor."* Leaders for this session will include Dr. Druzin, chair of the School's Assistant Professors Review Committee; Dr. Cheryl Gore-Felton, Co-Chair of the Appointments and Promotions Committee in the Department of Psychiatry and Behavioral Sciences; and Dr. Deirdre Lyell, Associate Professor of Obstetrics and Gynecology. Subsequent workshops will be held from January through May.

We hope you will take this opportunity to visit the [OAA website](#) to register and/or learn more about the workshops being offered in the coming months.

Open Access to Medical Literature

Over the past decade there has been a transformation in how we access and use information - and changes in the digital library in science and medicine are among the most notable. The traditional medical library has been transformed, and the LaneConnex and Lane Library stand at the forefront of this technology and service (see: <http://lane.stanford.edu/>). Stanford faculty, students and staff throughout the medical center (and in other ways around the world) can access the scientific and medical literature from anywhere at any time. Equally important are the exceptional services and innovations that Lane Library now provides. Of course these innovations come with a cost. Sadly and of great concern, the costs for subscriptions to journals has been increasing each year at levels far higher than inflation and other bioscience costs. These increases threaten our ability to sustain services unless the publishers of electronic journals become more reasonable in their charges.

This is also one of the reasons why public access is so important and why the seminal work of the **Public Library of Science (PLOS)** (see: <http://www.plos.org/about/>) - an effort led by Dr. Pat Brown, Professor of Biochemistry and Member of the Howard Hughes Medical Institute at Stanford - is so significant. Because of such efforts, open access journals are growing in respect, breadth, prominence, accessibility and relevance. Indeed, since 2000, the number of published Open Access articles has grown by an average rate of 30% per year. Currently there are over 14,000 Stanford-authored Open Access articles that are indexed in **PubMed**. Traditional subscription publishers are also launching Open Access journals as part of their portfolio.

While these important trends are rapidly unfolding, many questions about Open Access still abound. With that in mind, and in honor of national medical libraries month and open access week, [Lane Medical Library & Knowledge Management Center](#) is hosting a panel discussion on Open Access on **Tuesday, October 25th**, in [Li Ka Shing Center for Learning & Knowledge](#), LK120. This should be an important discussion and if you are interested you can register for it at: <http://lane.stanford.edu/help/openaccess/panel.html>.

Stanford Trauma Bike Safety Summit

On November 9th the Stanford Trauma Service, the Stanford University Medical Center and the Silicon Valley Bicycle Coalition will host an important event on bike safety. It will take place in the Li Ka Shing Center for Learning and Knowledge from 6:30 - 8pm. Given the many issues surrounding bicycle safety on the Stanford campus and more generally, this summit is timely and important. It will bring together leaders in policy and planning, law enforcement, healthcare and the cycling community to address biking accidents and potential solutions to their prevention. I commend the Stanford Trauma service and its partners and collaborators for this initiative and look forward to reporting results to you later in the year.

SAVE THE DATE

Wednesday, November 9, 2011
6:30-8:00 pm
Stanford University Medical Center, Li Ka Shing Center, 291 Campus Drive

Stanford Trauma BIKE SAFETY SUMMIT

An average of 5 bicycle crash victims arrive in the Trauma Center at Stanford Hospital and Clinics every week – many with life threatening injuries, resulting in time off the bike and time off of work. In order to reduce these incidents, we need to collectively begin to understand how to make our roads as safe as possible for all users.

The Summit is a forum designed to bring together leaders in the cycling community, high-ranking city and county officials, law enforcement, transportation planners, and emergency response agencies for an important discussion, which will examine the causes of these preventable incidents and plan for solutions to reduce them.

This is a 'by invitation only' event.
A formal invitation will be sent to you soon.

Upcoming Event: Breast Cancer Research Foundation Reception, October 20th

Breast Cancer Research Foundation Reception Honoring Dr. Michael Clarke

Thursday, October 20th | 10:30 AM

Bloomingtondale's, Stanford Shopping Center

As part of a nationwide campaign, the Bloomingtondale's at Stanford Shopping Center will partner with The Breast Cancer Research Foundation to honor breast cancer research grant recipients from Stanford Women's Cancer Center. Bloomingtondale's will host a reception at 10:30 a.m., Thursday, October 20th, for Dr. Michael F. Clarke, MD, Professor of Medical Oncology and Associate Director of the Stanford Institute for Stem Cell and Regenerative Medicine at Stanford. Join us at 10:30am to meet Dr. Clarke, as well as members of the Stanford Health Library, who provide wonderful information to our community.

Awards and Honors

- **Dr. Ralph Greco**, Johnson & Johnson Distinguished Professor, Department of Surgery, will be the recipient of the ACGME (Accreditation Committee on Graduate Medical Education) 2012 John C. Gienapp Award. This prestigious award honors individuals who have dedicated themselves to graduate medical education (GME) and who have made outstanding contributions to the enhancement of residency education and the ACGME accreditation activities. Dr. Greco will formally receive this award at a ceremony in March 2012. Please join me in congratulating Dr. Greco.
Profile: http://med.stanford.edu/profiles/Ralph_Greco/
- **Aimee Grace and Kristen Collins**, Residents in the Department of Pediatrics, have been awarded the American Academy of Pediatrics Anne E. Dyson Child Advocacy Award for their project, done in partnership with the San Jose Police Department, called "The Project to End Human Trafficking." This award "celebrates the outstanding efforts of pediatricians-in-training as they work in their communities to improve the health of children" and is one of the highest national awards for pediatric advocacy.
- **Members of the Robert A. Chase Hand Center and Department of Orthopaedics** have won the Emanuel B. Kaplan Award for the presentation/poster at the 2011 American Society for Surgery of the Hand's annual meeting judged to represent "anatomical excellence in surgery of the hand." The team represents the breadth of the Stanford medicine experience: a hand fellow, an international scholar, a medical student, and junior and senior faculty members. Congratulations to team members: Dr. Andrew Zhang, Dr. Elisabet Hagart, Dr. Jeffrey Yao, Dr. Amy Ladd and Sara Van Nortwick, BA.
Jeffrey Yao: http://med.stanford.edu/profiles/Jeffrey_Yao/
Amy Ladd: http://med.stanford.edu/profiles/Amy_Ladd/
- **Dr. Beverly Mitchell**, George E. Becker Professor in Medicine and Professor, by courtesy, of Chemical and Systems Biology, has been awarded the Albion Walter Hewlett Award. This award was developed by the Department of Medicine to honor an exceptional physician with ties to Stanford.
Profile: http://med.stanford.edu/profiles/Beverly_Mitchell/
- **Dr. Geoffrey C. Gurtner**, Professor of Surgery at the Stanford University Medical Center and, by courtesy, of Materials Science and Engineering, has been selected by the Plastic Surgery Foundation (PSF) to receive the 2011 PSF Outstanding Achievement in Basic

and Translational Research Award at this year's ASPS/PSF Annual Meeting.

Profile: http://med.stanford.edu/profiles/Geoffrey_Gurtner/

- **Dr. Phil Lavori**, Professor (Biostatistics) in the Department of Health Research and Policy at Stanford University, is this year's recipient of the Harvard Award in Psychiatric Epidemiology and Biostatistics. The award recognizes Professor Lavori's lifelong career contributions that have significantly advanced the field of Psychiatric Biostatistics.
Profile: http://med.stanford.edu/profiles/Philip_Lavori/

Appointments and Promotions

- **Fritz R. Bech** has been reappointed to Assistant Professor of Surgery at the Veterans Affairs Palo Alto Health Care System, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Fritz_Bech/
- **Nikolas H. Blevins** has been promoted to Professor of Otolaryngology - Head and Neck Surgery at the Stanford University Medical Center, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Nikolas_Blevins/
- **Burton Brent** has been promoted to Adjunct Clinical Professor of Surgery, effective 9/1/2010.
- **William Brose** has been promoted to Adjunct Clinical Professor of Anesthesia, effective 8/1/2011.
- **Jan Carette** has been appointed to Assistant Professor of Microbiology and Immunology, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Jan_Carette/
- **Lu Chen** has been appointed to Associate Professor of Psychiatry and Behavioral Sciences effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Lu_Chen/
- **John Costouros** has been appointed to Assistant Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/John_Costouros/
- **Stephen A. Felt** has been reappointed to Assistant Professor of Comparative Medicine at the Stanford University Medical Center, effective 12/1/2011.
Profile: http://med.stanford.edu/profiles/Stephen_Felt/
- **Sally Harris** has been promoted to Adjunct Clinical Associate Professor of Pediatrics, effective 9/1/2011.
- **Tina Hernandez-Boussard** has been appointed to Assistant Professor (Research) of Surgery, effective 10/1/2011.
- **Manjula Jeyapalan-Noone** has been promoted to Adjunct Clinical Assistant Professor of Surgery, effective 9/1/2011.
- **Ernest Kaplan** has been promoted to Adjunct Clinical Professor of Surgery, effective 9/1/2010.
- **Holden Maecker** has been appointed to Associate Professor (Research) of Microbiology and Immunology, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Holden_Maecker/
- **Stephen B. Montgomery** has been appointed to Assistant Professor of Pathology and of Genetics, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Stephen_Montgomery/

- **Kathryn P. Rodan** has been promoted to Adjunct Clinical Associate Professor of Dermatology, effective 9/1/2011.
- **Sandhya Srinivas** has been reappointed to Associate Professor of Medicine at the Stanford University Medical Center, effective 9/1/2011.
Profile: http://med.stanford.edu/profiles/Sandhya_Srinivas/
- **Juergen K. Willmann** has been promoted to Associate Professor of Radiology , effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Juergen_Willmann/
- **Anton Wyss-Coray** has been appointed to Professor of Neurology, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Tony_Wyss-Coray/
- **Yunzhi Peter Yang** has been appointed to Associate Professor of Orthopaedic Surgery, effective 10/1/2011.
Profile: http://med.stanford.edu/profiles/Yunzhi%20Peter_Yang/

October 24, 2011

Beginning a Discussion about Academic-Industry Collaborations and the School of Medicine

On Saturday morning, October 15th, we held the first of a planned series of think tanks and discussions on the broad topic of Industry-Academic Collaborations. Just over 30 faculty leaders, as well as leaders in industry, attended and participated in a far-ranging and exploratory dialogue. We considered examples of industry collaborations in other disciplines and medical schools, and, most importantly, we discussed what we might do at Stanford that would be unique to our culture and institution and that would foster and enhance productive, beneficial interactions.

Over the past several years much of the focus about industry and academia has been on conflict-of-interest (COI). And while these issues and concerns were and are still very real, we now have clear and transparent policies in place at Stanford. Thus the point of the October 15th Think Tank was not about COI but about how to foster productive interactions with industry partners with the goal of advancing the translation of discoveries into diagnostics, drugs, biologics and devices.

I noted in my introduction to the Think Tank that a number of peer institutions are seeking interactions with industry to create new funding sources to compensate for losses in sponsored research dollars. While we certainly want to explore new funding sources, the goal of the discussion was not about money *per se* – but about creating productive collaborations. We already have some important models at Stanford, including SPARK (<http://sparkmed.stanford.edu/>), Biodesign (<http://biodesign.stanford.edu/bdn/index.jsp>), the Coulter Foundation program (<http://bioengineering.stanford.edu/coulter/>), and BioX corporate partnerships (<http://biox.stanford.edu/forum/index.html>). So the question is: what else should we consider that would be effective as well as unique to our institution and our setting in Silicon Valley, one of the major centers of biotechnology in the world? The goal of this first meeting was to layout ideas and suggestions – ideally “blue sky and green field” ideas - and to then probe

and explore them more fully and deeply in the months ahead. We are also planning to continue the discussion at our Strategic Planning Leadership Retreat in January 2012.

I want to share with you some of the discussion items, comments and recommendations that were presented at the think tank for your reflection. As always I am very interested in any feedback or other offerings you would like to make – since this is very much in a formative process of development.

To frame the discussion we began our think tank with an update from Dr. Lynn Orr, Keleen and Carlton Beal Professor in Petroleum Engineering and Director of the Precourt Institute for Energy, about the Stanford Global Climate and Energy Project (GCEP), which is now in its 8th year. To initiate this project, four companies (Exon Mobil, GE, Toyota and Slumberger), each of which had well established, deep and capable research programs, collectively committed \$225 million over 10 years in a contract grant (not a gift and paying full indirect costs) to focus on reducing greenhouse gas emissions. This collaboration concentrates on research that will likely extend over decades and that is not immediately applicable (the equivalent of biosciences basic fundamental research). The funding has been used to support faculty proposals for what Dr. Orr referred to as “step-out” research – meaning projects on new ideas that generate new collaborations and programs that are outside or separate from a faculty member’s current research. This is designed to foster new innovations in areas that might be considered risky. In the Global Climate and Energy Project, Stanford owns the Intellectual Property (IP) from the research but companies can get royalties. While there are lots of lessons and issues that have been learned from these interactions, a key feature is that these companies are interested in funding the next generation of energy technology – seeking long term as compared to short term results.

The evidence to date is that GCEP funding has stimulated new areas of research and collaboration – and according to Jim Plummer, Dean of the School of Engineering, who also attended the Think Tank, it has transformed the focus of some departments at Stanford. In fact, in the physical and engineering sciences programs at Stanford, collaborations with industry are more the norm than they are in the biosciences – in part because companies are willing to invest in long term, more basic research and in part because when a technology is invented, it is easier to hand it off more cleanly to industry than is the case in the life sciences – where continued development is needed and human subjects become involved in the process of translating discoveries into products. Of interest, according to Dr. Plummer, in the School of Engineering, corporate funding supports around 40% of the research effort – compared to around 5% in the School of Medicine. It should be noted most of the research funding to the School of Medicine comes from sponsored competitive funding. While the collaborations described by Drs. Orr and Plummer with industry partners have been highly successful to date, the question of whether these relationships will endure over time remains to be determined – since priorities change within industry, just as they do in academia. That said, the model of collaboration in global climate and energy research is informative and interesting.

We then moved onto models closer to home that have been used for decades in the biosciences but that are undergoing some evolution and change in recent years. Some of these models are the large “money over the wall” programs that have existed in the past at some of our peer schools (e.g., Washington University, UC Berkeley, UCSF and Harvard among others) where large amounts (many tens of millions of dollars) were given to universities to promote research that

might be relevant to industry. Indeed, there was a comparable experience at Stanford some years ago as well. The common wisdom is that, while this funding spawned some significant new research directions for academia, the payoff to industry in products that could be developed for clinical use has been negligible.

The question is what is happening now. Because there has been considerable press coverage about the successes at peer institutions about large amounts of money received from industry, we had an opportunity to learn more about some of these experiences as well. One clear lesson is that companies seek partnerships with specific faculty or, if there is a larger effort, they want to do so in a more business-imperative way. Unlike the long-term funding cycle that seems to be occurring in the physical sciences, the focus in the life sciences tends to be more short term and more product- specific – and funding is vulnerable if results don't look as though they will lead to a marketable product. Thus, funding is not necessarily sustainable – unless one builds a major clinical research infrastructure as has been done at Duke, which has been highly productive but which operates more autonomously and, in the opinion of some, becomes a distraction to faculty from pursuing more fundamental research. Another important issue in these larger corporate initiatives is the governance as well as the management of the funds. While some of these efforts appear (at least in the press) to be trans-institutional, many are in fact driven by smaller groups of faculty.

In recent years at Stanford, industry interactions have been concentrated in individual faculty or groups of faculty, some of whom have formed collaborations with industry while others have formed companies. There are also novel programs such as SPARK (for diagnostics, drugs and biologics) and Biodesign (for med-tech), which have been quite successful and which have spawned similar programs at a number of institutions seeking to develop similar strategies. I hasten to add that SPARK and Biodesign are “uniquely Stanford” in their entrepreneurial focus, which encompasses bringing different communities together from within and outside of Stanford and fostering new products and devices, including a number of new companies.

Following the discussion of models from the physical and engineering sciences, a large Pharma collaboration with a specific medical school, and the innovative SPARK, Biodesign, Coulter and other programs at Stanford, the remainder of the think tank was taken up with commentaries, perspectives, concerns and recommendations from the participants. Since we are not at the stage of formulating a Stanford plan (assuming we do get to that point) it seems more useful to simply share some of these perspectives – without attribution and commentary. Since I asked for the industry participants to speak first, their comments are provided first below; they are followed by other perspectives:

- A perspective from one industry attendee is that to be successful we should create a unit within the School of Medicine that selects promising ideas and then contracts research to take the idea or invention to the next level of development. This would require an oversight committee (including industry and faculty) and would either have to self-invest in product development or seek partners to create an investment pool.
- Another perspective is to do what we do well – basic discovery, which builds on the strength of Stanford faculty. This would not dismiss the prospect for large corporate funding sources (perhaps analogous to the Global Climate and Energy Project) but would simply foster the best contributions from the most creative faculty.

- It was suggested that a unique contribution for an institution like Stanford would be to create large clinical databases that could be mined for discovery or utilized to develop more novel approaches to clinical trial design.
- One industry participant, having heard about the existing SPARK program, advocated for “moving it to another level.” This would require an investment pool and would need to develop products through phase II if they are to be appealing to potential industry partners.
- A still different industry perspective built on the fact that Pharma (much of which has pulled out of research) is mostly interested in Phase II level interactions. To that end, this individual suggested establishing a structure that would not be run by faculty and that would provide the expertise and resources to move from scientific discovery to product development.
- Needless to say there were varied reactions to one or more of these proposals. While it was noted by several that the clinical trial infrastructure at Stanford needs further development, there was little support to move to a Duke-like model for clinical trials. Rather, the focus was on developing interactions across the university – doing “science without borders,” creating incubators with the engineering and physical sciences, and developing refinements in our clinical trial machinery.
- There were also varying degrees of concern and even admonition about the focus of the think tank discussions. These ranged from worries about whether corporate partners would seek to define the projects in the life sciences (unlike what was described in the engineering and physical sciences) and also whether these relationships would have unintended consequences, changing our culture and negatively impacting the time that faculty can devote to basic discovery. A number of faculty expressed concerns that engaging in Phase II type research is outside our ideal area of focus and would negatively affect our academic enterprise. Needless to say, others felt that without more industry collaboration, we would lose creative faculty or miss unique opportunities. It was also noted that some Pharma could be willing to invest in basic research or seed funding – as has been observed with the BioX program.

I have highlighted issues that were discussed to give you some texture of the dialogue that ensued. It is important to add that as long as we set clear priorities there is no reason to think that industry-academic collaborations are incompatible with our mission in basic discovery at Stanford. The question is: what can we do that is unique that will advance science, discovery and innovation and its translation to patients and the public good? Likely the needs and approaches of some members of our broad and diverse community (e.g., med-tech) will be different than other groups (drugs and biologics). Our unique strengths may lie in areas that build on our expertise in statistics, genomics, new approaches to study design and the emerging field of “regulatory science.” The use of our social networking technology could help identify areas for collaboration or interaction between faculty within Stanford or with potential industry partners. In addition, opportunities for novel exchanges and experiences for our students in industry settings– or for industry scientists in academic settings – are worthy of discussion, especially given the wealth of companies and programs in the Bay Area. Further, the potential for faculty to

engage in the design and evolution of policies impacting drug and device development is yet another area for interaction and development.

In addition to our discussions at Stanford, I have also tried to foster dialogue on this topic in other venues, including the Association of Academic Health Centers and other organizations. The broad issue of academic-industry relations needs critical re-thinking and will likely be approached differently by different universities and industries. Whether we develop some overarching approach at Stanford – or do what we can to foster faculty driven initiatives or programs like SPARK and Biodesign, as well as the interconnections between molecular imaging, genomics and informatics that can lead to early disease detection, will be an important question. We will continue the discussions – and I hope you will feel free to add a perspective as well.

When Cure No Seems Longer Possible

We all recognize that death is the inevitable consequence of birth and life. Understandably, we spend little time thinking about our own death or that of our loved ones – although this can change dramatically with unexpected illness or other catastrophic events. Of course, thinking about death is also influenced by age and by the societal events that impact individuals, communities and nations. Even in the face of adversity, denial of imminent death is more the rule than exception.

As physicians, the denial of the possibility of death can be a breach of our responsibility to care for patients holistically and through the course of illness with honesty, compassion and integrity. Physicians are educated and trained to heal and treat disease and often less equipped and comfortable with palliative and end-of-life care. That is a problem. It is easier for physicians and society to accept death when it comes at the end of a long life. But even here, the denial of death can be strong and deep in different cultures and communities.

The denial of death by physicians, patients and families is sometimes glaringly evident by the presence of patients in our intensive care facilities or acute care hospitals in the US whose prognosis for life is limited or dismal. Even more shocking is that nearly 40% of the hospitalized patients who are predicted by physicians to have less than a six month survival spend at least 10 days in an ICU before death – and more than half experience moderate to severe pain at the end of their life. These and related data formed the basis of an important discussion at the Stanford Hospital & Clinics Medical Staff Quarterly meeting that was led by Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs, who is also a nationally renowned expert in critical care medicine. While all too many physicians are reluctant or fail to have “end-of-life” discussions with patients they are caring for – often for fear that such a discussion would diminish hope – the false expectations of patients and families is equally problematic. Sadly, both patients and doctors can become complicit in not discussing the prospect of death, thus robbing individuals and their families from a more peaceful death, ideally at home and with hospice care.

As a pediatric oncologist who has confronted death in children with cancer all too frequently, especially before more curative therapies were developed, it seems inconceivable to not engage with a family – or the patient in an age-appropriate manner – about the prospect of death when cure seems no longer possible. My view, and this is generally true for the pediatric oncology community more broadly, is that preparing children and their families for death is an essential responsibility – to preserve the dignity of the child. An equally important goal is to help the

parents, family and the community to cope with the loss of a child knowing that they did all that they could to help their child fight disease – and face death when cure is no longer possible. With the availability of palliative care expertise by physicians, nurses and other providers, along with home and with hospice support, anticipatory and honest discussions about death and dying are as essential to the care of patients and families as are the initial discussions about diagnosis and treatment of illness and disease.

Recognizing that the attendees at the staff meeting were predominantly physicians who care for adults, I was struck by the differences between pediatric and adult medicine – and also by the considerable chasm that must be crossed to make palliative care an essential part of the dialogue between doctors and patients.

As a society, our ability to confront death remains shrouded by culture and belief systems. And of course we all must recognize that our individual confrontation with death is hard to anticipate – even if we feel informed and prepared. The different views about death and dying is what made former Stanford faculty member and incredible artist Anna Deveare Smith's recent play "*Let Me Down Easy*" so remarkable and moving (see: <http://med.stanford.edu/121/2009/deveare-smith.html>). Witnessing death through the arts is a help – and further discussion and dialogue on this topic within our community seems important and needed. Hopefully the discussion led by Dr. Rizk is a beginning of more reflective discussions to come – and improvements of our ability to care for individuals when cure no longer seems possible.

Provost Announces the Search Committee for the Dean of the School of Medicine

At the October 13th session of University Academic Senate Provost John Etchemendy announced the names of the search committee for the next dean of the School of Medicine as follows. As I have announced in prior communications, I will be completing my term as dean in the summer of 2013 (see: http://deansnewsletter.stanford.edu/archive/08_29_11.html#3).

Co-Chairs of the Committee:

- **John Etchemendy, PhD**, Provost and Patrick Suppes Family Professor in the School of Humanities and Sciences
- **Dr. Sam Gambhir**, Chair of the Department of Radiology and the Virginia and D.K. Ludwig Professor for Clinical Investigation in Cancer Research and Professor, by courtesy, of Bioengineering and Materials Science & Engineering

Committee Members:

- **John Boothroyd, PhD**, Professor of Microbiology and Immunology
- **Karl Deisseroth, MD/PhD**, Associate Professor of Bioengineering and of Psychiatry and Behavioral Sciences
- **Stephanie Kalfayan, JD** Vice Provost for Academic Affairs
- **Holbrook Kohrt, MD**, Fellow, Department of Medicine (Oncology)
- **John Levin, JD**, Board of Directors, Stanford Hospital & Clinics and Former Trustee, Stanford University
- **Beverly Mitchell, MD**, Director, Stanford Cancer Institute and George E. Becker Professor in Medicine and Professor, by courtesy, of Chemical and Systems Biology
- **Norman Rizk, MD**, Senior Associate Dean for Clinical Affairs and the Berthold and Belle N. Guggenhime Professor
- **Richard Saller, PhD**, Vernon R. and Lysbeth Warren Anderson Dean of the School of H&S and Kleinheinz Family Professor of European Studies

- **Christy Sandborg, MD**, Chief of Staff, Lucile Packard Children's Hospital and Professor Pediatrics
- **Lucy Shapiro, PhD**, Director, Beckman Center and Virginia and D. K. Ludwig Professor and Senior Fellow at the Freeman Spogli Institute for International Studies
- **Gary Steinberg, MD/PhD**, Director of the Stanford Institute for Neuro-Innovation and Translational Neuroscience, Chair, Department of Neurosurgery and Bernard and Ronni Lacroute-William Randolph Hearst Professor in Neurosurgery and Neurosciences and Professor, by courtesy, of Neurology & Neurological Sciences
- **Hannah Valentine, MD**, Senior Associate Dean for Diversity and Leadership and Professor of Medicine

This information is shared with you with the approval of the Provost.

The Annual Open Enrollment for University Benefits has been Announced and Includes Increased Access to Stanford Faculty Physicians

Every year at this time Stanford has its open enrollment period, during which members of the Stanford community sign up for the medical and other benefits offered by the University. For benefits that will become effective January 1, 2012, that period begins today and extends through November 15. This year there are changes to the medical benefits affecting many in our community that I want to make sure you are aware of. I highlight these changes since not infrequently faculty and staff sign up for health benefit programs that do not provide access to Stanford faculty physicians – should they want or need them. Importantly, changes in the plans being offered for 2012 will make it easier to gain access to Stanford faculty physicians.

Of note, a new plan called the Blue Shield Exclusive Provider Organization Plan (EPO) will be available for enrollment for 2012. This plan, like the currently available Blue Shield PPO plans, will provide Stanford faculty, staff and their families' access to Stanford faculty specialists without permission from their provider. This plan also continues access to the physicians at Palo Alto Medical Foundation. In addition, while there is no requirement to pick a primary care physician in either the EPO or the PPO plans, Stanford has primary care physicians with open practices. It should also be noted that Pacificare and Health Net will no longer be offered as a Stanford health option, and I hasten to add that these plans, now being discontinued, did not provide access to Stanford faculty physicians – and not infrequently resulted in concerns and disappointment when unexpected medical needs arose.

I am extremely pleased that, as a result of many months of significant effort on the parts of University and medical center leaders working collaboratively, we have a new way in which our employees can take advantage of the expertise of Stanford physicians. I encourage you to look carefully at the options in the materials that have been provided by the University and make the best choice for you and your family.

I also call to your attention the new program that Dr. Arnie Milstein, Director of the Clinical Research Excellence Center and Professor of Medicine, has established with the Medical Center and the University for the care of employees with chronic medical conditions. This innovative new clinical service will be based on a patient-centered intensive primary care model in which individuals with serious conditions (such as uncontrolled asthma or heart disease) will be able to receive focused care from a team that provides round-the-clock availability, home visits, regular support and coaching in self-management. We are also very pleased to have recruited Dr.

Alan Glaseroff, a nationally recognized leader in health care delivery, to direct this new clinical service along with Dr. Ann Lindsay (see: <http://med.stanford.edu/ism/2011/october/glaseroff.html>). This new service will begin around April of 2012 and is among a number of new healthcare delivery system innovations that will be unfolding in the months and years ahead at Stanford University Medical Center.

Update to the Executive Committee on the VA

On Friday October 7th, Dr. Larry Leung, Chief of Staff at the VA Palo Alto Health Care System (VAPAHCS) and the Maureen Lyles D'Ambrogio Professor of Medicine, gave an update to the Executive Committee on the VAPAHCS. I am pleased to provide Dr. Leung's summary of his presentation for your review.

The mission of the VA is to provide Veterans world-class care that improves their health and well being and to be a leader in education and research. In 1995, the Veterans Health Administration (VHA) underwent a successful transformation, including emphasizing chronic care and preventive medicine, installing an electronic medical record and instituting quality performance metrics. As a result, VHA now delivers high quality and efficient patient care comparable or superior to many private health care delivery systems. Within the VHA system, is recognized as a flagship.

VAPAHCS, under Director Lisa Freeman, provides care to 82,000 enrolled Veterans. There are three inpatient divisions, at Palo Alto, Menlo Park and Livermore, and seven community-based outpatient clinics, extending from Monterey to Sonora. A major thrust of the clinical program is Process Improvement, utilizing the Toyota Lean approach, under the direction of Dr. Paul Helgerson, Associate Chief of Staff (ACOS) for Process Improvement. Dr. Steven Asch was recently recruited to become the Director of Health Services R&D program and the ACOS of Clinical Effectiveness.

We have a strong collaborative partnership with the SOM. There are approximately 90 UTL and MCL faculty based at VAPAHCS, representing almost all the clinical disciplines. Many SOM faculty conduct their research programs primarily at the VA. VHA recently launched a major genomics initiative "Million Veterans Project (MVP)" in which one million patient DNA samples will be collected over the next several years. In collaboration with Drs. Michael Snyder, Chair of the Department of Genetics, and Wing Wong, Chair of Department of Statistics, and with the support of Dean Pizzo, VAPAHCS received funding from VHA to set up a Genomics and Informatics Coordination Center at Palo Alto.

More than \$1.5 billion of construction is undergoing at the Palo Alto and Menlo Park campuses. An 80-bed acute psychiatric hospital will be completed in 2012, and a Polytrauma and Blind Rehabilitation Center will be completed in 2014. These buildings will be followed by a new research building in 2016 and an Ambulatory Care Center in 2017.

We are proud to serve our Veterans and our clinical and research programs will further enhance our patient-centric care and consolidate the partnership between the two institutions.

Dr. Griff Harsh will Succeed Dr. Rob Jackler as the Associate Dean for Continuing Medical Education

Beginning January 2012, Dr. Griff Harsh, Professor of Neurosurgery, will succeed Dr. Rob

Jackler as the Associate Dean for Continuing Medical Education in the School of Medicine. I want to first thank Dr. Jackler along with Terri O'Grady, Executive Director, and the CME team for doing a terrific job over the past several years. When their work began the CME office was in significant disarray and the models for supporting CME were challenged. With diligence and considerable effort, Dr. Jackler, Ms. O'Grady and their colleagues have achieved Accreditation with Commendation from the Accreditation Council for Continuing Medical Education. This is a tribute to their outstanding work on behalf of the School of Medicine, and we owe them our gratitude and appreciation.

Dr. Harsh has a long history of commitment to excellence in education serving as Vice Chair for Education in the department of Neurosurgery since 2006, where he is also a Professor. Dr. Harsh is a summa cum laude and Rhodes Scholar graduate of Harvard College and received his MD from Harvard Medical School. He trained at the National Institutes of Health and UCSF and was on the faculty of UCSF and Harvard before joining Stanford in 1998. Dr. Harsh is a highly respected member of the Stanford community, and I am very pleased he has agreed to take on this important responsibility. As Associate Dean he will report to the Senior Associate Dean for Medical Education, Dr. Charles Prober.

Guidance to Faculty Regarding Participation in Internet Services Offering Medical Consultations

Without question technology is rapidly changing the way we access medical information and how patients seek advice and consultation from physicians. Also without question, potential infractions of patient privacy and confidentiality loom ever larger and should be a constant source of concern and vigilance for each of us. Further, what a faculty physician can do when requested to provide service as a consultant or resource over the Internet is a highly important question. This issue has recently raised concerns when a number of our faculty received invitations to join a new company that provides online video chatting "with top specialists" from around the country. Because this rapidly emerging intersection of technology, entrepreneurship, and the practice of medicine opens a new set of questions about medical care and physician/patient relationships in the 21st century, we sought an opinion from our Office of Academic Affairs and the Office of the General Counsel at Stanford. They have offered the position that I now share with you.

As physicians, we must protect the public as well as our individual and institutional responsibility. The "on-line" chatting being proposed and promulgated raises a number of fundamental issues that include: when does the interaction with a doctor and an individual (in this case electronically connected) constitute the practice of medicine? What are legal requirements for state licensure? What are the rules governing telemedicine? When is malpractice coverage available? If protected health information is shared or exchanged, is there assurance that it is encrypted and knowledge about how it would be stored or exchanged beyond the "chat"? And, do such exchanges conform with or violate contractual regulations within employer practice plans? Of course, these are just some of the questions that are raised. Because this is a new area, the Dean's Office asked a number of our legal, risk management, and Stanford Practice Plan experts for their opinions about such interactions. In doing so it was posited that there are significant potential risks to faculty members if these on-line interactions are determined to be the practice of medicine.

The consensus that emerged from this review is that these types of Internet “chats or consultations” would most likely be treated as the practice of medicine, and are thus governed by the Rules of Practice for the Physicians and Psychologists in the School of Medicine (med.stanford.edu/academicaffairs/documents/rules-of-practice.pdf). **Based on the reviews and the Rules of Practice, the School of Medicine will not support the decision of a faculty member to join this type of business at this time.** Clearly, there is significant interest in the expansion of physician/patient interaction in social media, and the School will continue to explore these opportunities.

Annual Luncheon with Emeritus and Senior Faculty

On October 12th I had the privilege of attending the Annual Lunch for Emeritus and Senior Faculty luncheon. It is always an honor to meet with the faculty and spouses who are able to attend and who have played such a major role in making Stanford a great institution.

Universities and medical schools like Stanford enjoy a rich heritage, which we celebrate too infrequently. The opportunity to share the state-of-the-school with our long-time faculty and to benefit from their special perspective and experience is both humbling and extremely helpful. I want to thank them for taking the time to attend this annual event and for both listening and making valuable comments and recommendations.

Li Ka Shing Among the Recipients of the 2011 Carnegie Medal of Philanthropy

On October the 20th I had the pleasure of attending the Tenth Anniversary of the Carnegie Medal of Philanthropy celebration at the New York Public Library in New York City. The Carnegie Medal of Philanthropy, the most celebrated award in philanthropy, was established in 2001 to mark the centennial of Andrew Carnegie’s retirement from business and the beginning, in earnest, of his efforts to distribute his fortune in a manner that would, in his words, “do real and permanent good in this world.” This year, Mr. Li Ka Shing was one of the 10 recipients to receive this award. What was striking is how many of the recipients (who in addition to Mr. Li included the Crown Family; the Danforth Family; Fiona and Stanley Druckenmiller; Fred Kavli; the Lauder Family: Evelyn and Leonard Lauder, Jo Carole and Ronald Lauder; Pamela and Pierre Omidyar; the Pew Family; and the Pritzker Family) have come from immigrant families or who, like Andrew Carnegie, earned their wealth and then became remarkably philanthropic. Further, their contributions have provided incredible contributions to higher education, science, medicine, peace and social justice. Equally, virtually each of those awarded the 2011 Carnegie Medal of Philanthropy, along with a number of past recipients, have made donations to Stanford University, which makes our connection to the Medal notable and important. What is also striking is that even during times of economic downturn, such as the past several years, philanthropy has been sustained – a tradition that has been deeply rooted in America and that has contributed significantly to our universities and research institutions as well as the arts and humanities.

It was just a year ago that we officially dedicated the Li Ka Shing Center for Learning and Knowledge (see: <http://lksc.stanford.edu/>) and had the opportunity to honor and thank Mr. Li at Stanford (see: <http://lksc.stanford.edu/li-ka-shing.html>). When I was growing up in New York City in a first generation family with limited resources, institutions like the New York Public Library were not only iconic – they were transformational to individuals, and they opened the doors to learning and opportunity that would not have otherwise been possible. It was a moving experience to be back in that magnificent building, which is still accessible to every individual

who seeks entrance, and to witness the impact that it – and the public library system that Andrew Carnegie helped spawn – has had on the life of our citizens and nation.

Li Ka Shing grew up in poverty and became a self-educated entrepreneur and among the world's most successful businessmen. He became philanthropic early in his life – as soon as he began earning money – and that pattern has continued throughout his life. To date, the Li Ka Shing Foundation has granted over US \$1.6 billion to charitable causes throughout the world including our Li Ka Shing Center for Learning and Knowledge, which has become a centerpiece for the School of Medicine. We remain extremely grateful to Mr. Li for his wonderful contribution that made the LKSC become a reality. Also attending this wonderful event in NYC was Dr. Alan Yeung, the Li Ka Shing Professor and Chief of the Division of Cardiology in the Department of Medicine, who has been instrumental over the years in the success of our fundraising efforts. In the spirit of Andrew Carnegie, individuals like Mr. Li, who dedicate their private wealth to the public good, do very much change the world. And we are grateful.

The Launch of CAP NETWORK

Building on the success of the School's Community Academic Profiles (CAP) system, this past weekend a new platform for online collaboration called CAP NETWORK was launched <http://med.stanford.edu/ism/2011/october/cap-1024.html>. Integrated into the CAP system and leveraging the powerful paradigms of social networking, CAP NETWORK incorporates searchable online profiles for all members of the School of Medicine, including staff for the first time, bringing the total number of people in the system to nearly 10,000. Added to these profiles are a new private Stanford-only collaboration environment that includes features commonly found on sites such as Facebook and Twitter. The CAP NETWORK environment will only be available to the Stanford community and we hope it will provide a safe and secure way for the community to interact and work together in new ways. The major features of this system include:

- Rich online profiles for all staff, faculty, postdocs and students in the School of Medicine. (~10,000 people)
- The ability to post updates, share files and photos with interactive commenting and "liking".
- The ability to "follow" others and receive updates about their activities.
- Support for creating groups that can be private with controlled membership or open to anyone in the community.
- Access to the social network features using an app for all common phones and tablets, and a stand alone desktop client.

While the use of social networking tools is increasingly common in our personal lives, their use in professional settings is only just beginning to be explored and the School's deployment of such a platform to a broad academic community is innovative. We expect to learn much in the coming months as CAP NETWORK is put to use across our varied missions. We have formed a CAP Advisory Committee consisting of representatives from a wide spectrum of the School of Medicine community to help guide the project.

The CAP NETWORK project is being developed and operated by the School of Medicine's Office of Information Resources and Technology (IRT).

For more information about CAP Network visit <http://med.stanford.edu/cap/index.html>

Information Security Day

On November 9th, the Information Resources and Technology (IRT) Information Security Services will host the Second Information Security Day: an event to educate the Stanford Medicine community about computer security in a friendly and accessible way. Given the numerous challenges and issues that continue to arise of HIPPA, students, staff, and faculty are invited to attend.

According to Ellen Amsel, Director, Information Security Service, this year's theme is focused on social networking, its security pitfalls, and how to use it safely and responsibly. The event will take place on Wednesday, November 9th, from 10:00am - 2:30pm in Alway M106. To register for this year's ISD, visit: <http://med.stanford.edu/irt/security/isd.html>

Three Faculty are Elected to the Institute of Medicine

On October 17th, three distinguished Stanford School of Medicine faculty members were elected to the Institute of Medicine of the National Academy of Sciences. As noted in the announcement of the 65 new members “election to the IOM is considered one of the highest honors in the fields of health and medicine and recognizes individuals who have demonstrated outstanding professional achievement and commitment to service.” As noted by Dr. Harvey Fineberg, President of the IOM, “each of them stands out as a professional whose research, knowledge, and skills have significantly advanced health and medicine, and their achievements are an inspiration.” This years newly elected Members of the IOM are:

- **Dr. Margaret (Minx) Fuller**, Professor of Developmental Biology and of Genetics
- **Dr. David A. Relman**, Thomas M and Joan C. Merigan Professor of Medicine and of Microbiology and Immunology
- **Dr. Abraham Verghese**, Professor of Medicine and Senior Associate Chair for the Theory and Practice of Medicine, Department of Medicine

Each of these newly elected members has made exceptional contributions in different areas of art and science of medicine (see: <http://med.stanford.edu/ism/2011/october/brief-iom-1017.html>). Please join me in congratulating them.

Awards and Honors

- **Dr. David Stevenson**, Vice Dean and Senior Associate Dean for Academic Affairs and Harold K. Faber Professor of Pediatrics and Professor, by courtesy, of Obstetrics and Gynecology, received the prestigious Jonas Salk Leadership in Prematurity Prevention Award from the March of Dimes on October 20th in an event in Washington, DC. This is a wonderful and well-deserved honor for Dr. Stevenson. Please join me in congratulating him.
- **Dr. Gary Nolan** was honored at an investiture event to celebrate his being named the Rachford and Carlotta Harris Professorship. I had the pleasure of knowing Mr. Harris prior to his death in 2010 at 98 years of age. Mr. Rachford's grandson Tristan Harris, a 2006 graduate of Stanford, represented the family and offered reflections on his

grandparents who contributed the professorship. In addition to his other awards, Dr. Nolan was honored as one of the top 25 inventors at Stanford.

- **William C. Fowkes**, Professor Emeritus of Family Medicine, received the 2011 John W. Gardner Visionary Award from the Pathways Hospice Foundation for his dedication to end of life care. Dr. Fowkes founded Family Medicine at Stanford as well as the Family Medicine Residency now at O'Connor Hospital in San Jose.

Dr. George Caballero, Resident in Anesthesia, and **Dr. Alex Macario**, Professor of Anesthesia, have been awarded the American Society of Anesthesiologists' Professional Diversity Mentorship Award.

Dean's Newsletter

November 15, 2011

Value of Biomedical Research – and Challenges to its Future

The support for biomedical research from the National Institutes of Health (NIH) over the past several decades has made the US the world leader in the life sciences. The NIH budget is approximately \$30 billion, just over half of which funds fundamental basic science research. It is the investment in basic science that has led to every major innovation and discovery in this country since the establishment of the NIH. This is important in its own right. But this new knowledge has also paved the way for new treatments and cures, many of which could not have been envisioned when scientists began their fundamental inquiries. I have frequently written about this topic, which needs no justification at Stanford, where advancing science and innovation are among the highest priorities. When we attempt to evaluate the impact of basic research we appropriately cite examples of how discoveries have changed the way we think about human biology or how knowledge has been translated into new tools and devices to diagnose, treat or prevent human disease. Often we find ourselves looking back to the roots of discovery that extend years or even decades into the past. Investments in science must be viewed over the long term.

It is particularly exciting to observe the ongoing evolution of scientific discovery and ponder where it will go into the future. I had the opportunity to glimpse one such area at the Council of Dean's Symposium on Interdisciplinary Discovery at the recent meeting of the AAMC (Association of American Medical Colleges), where two of our Stanford faculty members led a "thought leader" session on "*Cracking the Neural Code*." I had invited **Dr. Karl Deisseroth**, Associate Professor of Bioengineering and of Psychiatry and Behavioral Science and HHMI Investigator, and **Dr. Mark Schnitzer**, Associate Professor of Biology and Applied Physics and HHMI Investigator, to share some of their incredibly exciting research findings in the newly created fields of optogenetics and optic imaging. Their fundamental research dissects and sheds light (literally!) on neural networks and elucidates brain function and behavior in experimental models. Their innovative research (each are recipients of an NIH Director's Pioneer Awards) will unquestionably impact how we think about the nervous system and potentially how neurological and psychiatric diseases are treated in the future. But those advances are likely to occur many years into the future – making continued investment in this basic research essential.

Of course this applies to countless other examples – at Stanford and at other institutions receiving support from the NIH for other investigators around the US.

Closely juxtaposed with the exciting presentations of Drs. Deisseroth and Schnitzer was a “thought leader” presentation by Dr. Francis Collins, Director of the NIH. He began his presentation by underscoring the importance of basic science research and gave examples of how fundamental discoveries have helped spawn unexpected new medical treatments. He also addressed his plans to enhance and accelerate the translation pipeline and overcome some of its well known impediments. He underscored the importance of supporting new young investigators and of placing special emphasis on overcoming the seeming unintended bias that negatively affects research support for underrepresented minority scientists (see: <http://www.sciencemag.org/site/feature/data/hottopics/race-nihfunding/>)

Of course the elephant in the room during Dr. Collins’ presentation was the uncertainty of the federal budget in FY12 and beyond and how it will impact NIH funding (along with other federal programs like Medicare and Medicaid), potentially in ways that could have major consequences for medical schools and teaching hospitals. In that regard, the so-called 12 member “Super-Committee” will soon make its recommendations to the Congress on the \$1.2 trillion debt reduction. These could result in a relatively flat budget for the NIH – or more significant reductions. In either scenario the purchasing power of NIH dollars today is getting close to 2001 number or worse, an issue we are all understandably concerned about.

While Dr. Collins emphasized his commitment to do everything possible to support innovative biomedical research, he acknowledged that senior leadership at NIH is considering various options that could be pursued. These include limiting the total amount of funding per investigator, limiting the total number of grants per investigator, limiting the size of direct costs of grants and reducing the cap on the amount of faculty compensation that can be charged to an NIH grant(s) (see: [Ways of Managing NIH Resources](#)). While the purported goal of these deliberations is to allow a more limited NIH budget to go further, the reality is that any or all of these options would have a significant impact on investigators and institutions. The net result is cost shifting and potentially a reduction of support to the most successful and competitive investigators.

Dr. Collins was quick to comment that he personally supports NIH funding as a meritocracy, but the fact that these options are being considered – and even posted on NIH websites for discussion – conveys the sense that they and other options are likely being seriously entertained. Without question a reduction in overall NIH funding, especially if coupled with an ever more competitive environment of funding success and lower amounts of funding to investigators and institutions, would have a chilling impact on research intensive institutions – including Stanford. The fact that our faculty has been enormously successful in competing for NIH grants in the past does not ensure that such changes would provide sufficient resources to continue ongoing and productive research programs. Obviously these are issues of profound importance to the future of academic medicine and bioscience in the US.

While we see the economic forces impacting the NIH as having a major impact on the future of innovation and discovery, there is also a significant impact of publicly funded research on jobs and the economic security of cities and states in the US. This is clearly illustrated by a report issued by the AAMC on November 7th in which the consulting group of Tripp Mach measured

the economic impact of medical schools and teaching hospitals on regional and national economic viability. For example in 2008, Tripp Mach reported that the impact of AAMC member organizations was \$512 billion and that these institutions accounted for more than 3.3 million full-time jobs or one in every 43 wage earners. Their more recent analysis shows that federal and state-funded research received by medical schools and teaching hospitals in 2009 added approximately \$45 billion to the economy. (The full report, *The Economic Impact of Publicly Funded Research Conducted by AAMC-Member Medical Schools and Teaching Hospitals*, is available online at www.aamc.org.) Put another way, the analysis shows that for every dollar invested in research at medical schools and teaching hospitals, \$2.60 of economic activity occurs. This is an important multiplier effect – especially during an economic downturn such as the one we are now experiencing.

The downstream effect of biomedical research creates jobs directly related to the sponsored investigation but also helps create jobs in industry and communities. California leads the nation with a total economic impact of \$5,360,125,905 from federal and state research funding and a total direct employment impact of 35,734 jobs. Across the nation, a total of 299,649 jobs in the US in 2009 were directly or indirectly attributable to AAMC-member research from state or federal funding. When informed of these results, Dr. Collins noted that these findings “demonstrate that NIH’s investment in biomedical research continues to have a positive effect on the health and economy of the nation.”

Advocating for the benefits of federal and state support for research is a responsibility we all share. Of course we are all cognizant of the many challenges facing higher education and the viability of our very communities at this time of distress. But research has the potential to improve the delivery of healthcare in the future and lower its costs to society. And it also has the real benefit of improving our economy and job growth right now.

An Invitation to Virtual Town Hall Discussions on CAP Network

We recently announced the launch of CAP Network – what we believe to be the first and only social network in a medical school in the US (see: <http://med.stanford.edu/ism/2011/october/cap-1024.html>). Over the 2-3 weeks since the launch a number of groups have been formed that bring research faculty, clinical faculty, students and staff into closer alignment and connection. This new offering is best viewed as an experiment, and I am looking at ways to utilize this new tool to promote discussion and dialogue within our Stanford Medicine community. It remains to be seen how this will unfold, but here is one idea. In the near future I will offer a comment about an issue affecting our community on CAP Network that will be either informational or designed to provoke some discussion and debate. The goal will be to create the equivalent of a virtual town hall meeting in which issues can be aired and discussed. While I always hope to get comments to this Newsletter, the reality is that it is not a public forum for discussion (although it is publicly available). CAP Network is private to our Stanford community and lends itself to more “controlled reflections and discussions.”

If you are interested in participating in this dialogue, you simply need to login to the CAP Network and "Follow" my profile. You can do this by clicking on the Follow link on my profile: https://med.stanford.edu/profiles/stanford/Philip_Pizzo/ (note, only individuals with activated CAP Network accounts can participate). We’ll see if this new way of connecting helps stimulate discussion that is productive to our Stanford community – in information or in action!

Appointment of New Cross-Institutional Privacy Task Force

The following update comes from Marcia Cohen, Senior Associate Dean for Finance and Administration, who was recently appointed to co-lead a cross-institutional task force on Privacy at the Stanford University Medical Center. Given the importance of HIPAA and the impact of violations on individuals and our institution(s) it seemed timely and prudent to appoint this task force. The new task force has been appointed by Christopher Dawes, President and CEO of the Lucile Packard Children's Hospital, Amir Rubin, President and CEO of Stanford Hospital and Clinics, and myself. I asked Ms. Cohen to prepare an update on this new task force, and her report follows:

Although our three organizations already place the highest priority on data privacy, we know there is more that we can do to be exemplary leaders in this area. Each of our organizations has safeguards in place, but steadily increasing risks from heightened enforcement activities and public scrutiny of institutional practices require a more formal and shared engagement of senior management. Further, our patients depend on all of us to protect their private health information. All physicians, physicians-in-training, health care professionals, and administrators need to maintain the confidentiality of these very personal data. This will require all of us to be acutely aware of risky areas with regards to transmitting confidential patient data and to re-double our commitment to following policies and procedures for safeguarding data.

To further our efforts in this important area, Mr. Amir Rubin, Chief Executive Officer of Stanford Hospital & Clinics (SHC), Mr. Christopher Dawes, Chief Executive Officer of Lucile Packard Children's Hospital (LPCH), and Philip Pizzo, Dean of the School of Medicine (SOM), have jointly appointed a new cross-institutional Task Force to address important enhancements to protect patient and research participant information.

The co-chairs are: Marcia Cohen, Senior Associate Dean, Finance and Administration, Daniel Morissette, Chief Financial Officer, Stanford Hospital and Clinics, and Timothy Carmack, Chief Financial Officer, Lucile Packard Children's Hospital. The following senior leaders appointed to the Task Force will support them in this effort:

- Jill Buathier, Vice President, Revenue Operations, SHC
- Clarence Braddock, Professor of Medicine, (General Internal Medicine), SOM
- Jeff Driver, Chief Risk Officer & Director of Risk Management, SHC/LPCH
- Todd Ferris, Director of Informatics Services for the Stanford Center for Clinical Informatics (SCCI) and Director of Privacy and Security in the Office of Information Resources & Technology (IRT), SOM
- Nick Gaich, Executive Director, Chief Operating Officer, Spectrum, SOM
- Gary Hartman, Clinical Professor, Surgery (Pediatric Surgery), LPCH
- Ann James, Senior University Counsel, Stanford University (SU) Office of General Counsel
- Diane Meyer, Chief Compliance and Privacy Officer, SHC/LPCH
- Mike Mucha, IT Security Officer, LPCH
- Tanya Okon, Director Privacy & Compliance Assurance, SHC/LPCH
- Norman Rizk, Senior Associate Dean, Clinical Affairs in the School of Medicine and the Berthold and Belle N. Guggenhime Professor in Medicine, and Interim Chief Medical Officer, SHC; SHC/SOM
- Connie Sadler, IT Security Officer, LPCH

- Topher Sharp Clinical Associate Professor of Medicine, SHC
- Greg Souza, VP, Human Resources, LPCH
- Susan Stayn, Senior University Counsel, SU OGC
- Susan Weinstein, Assistant Vice President for Business Development and University Privacy Officer, SU

The charge to the Task Force is to enhance protection of patient and research participant information and to establish strong communication lines organization wide. The Task Force will develop joint recommendations for improved short-term and long-term controls in the following key areas:

- Cross-institutional security controls for computers, portable devices, and other technologies that contain protected health information and enhanced controls on removal of protected health information from the workplace.
- Enhanced vendor controls, including for business associates, subcontractors, and agents, and third-party access to electronic medical records and paper records.
- Review of our training programs, including frequency, content, and timing
- Safeguards on data access for research purposes
- Proactive management roles and procedures in the event of a breach or similar incident
- Consequences to employees (faculty and non-faculty), students and trainees in the event of failure to comply with privacy policies and procedures

In each of these areas, the joint Task Force will appoint sub groups incorporating additional individuals who will make recommendations that the Task Force will review. The Task Force will be submitting the first of the recommendations in early January to the hospital CEOs and the Dean.

A Reminder to Residents and Clinical Fellows on Patient Privacy That is Broadly Relevant

Because of some recent problems and confusion, I asked Dr. Clarence Braddock, Professor of Medicine and Associate Dean for Undergraduate and Graduate Education, and Dr. Todd Ferris, Director of Privacy and Security in the Office of Information Resources & Technology (IRT), to prepare a communication highlighting some of the key and essential “do’s” and “don’ts” regarding protected health information (PHI). In reviewing the communication they sent to all of our Residents and Clinical Fellows I felt that it had relevance to our entire community, and I thought it would be helpful to share its content with you as well. It also serves as a reminder of the issues and realities we should all be cognizant of in order to protect our patients, each other, and our institution. Here is the message:

"We in the Stanford University Medical community are working together to re-double our efforts to protect patient health information (PHI). Our patients expect and deserve our compliance with the requirements for protection of PHI, and part of that effort is making sure we are all being careful in the many ways that we communicate with one another in the care of patients. We have prepared a list to "to dos" and "don'ts" as a quick reminder of steps you should take and steps that should be avoided at all costs. When considering access, use, or transmittal of PHI, always:

- **DO** treat all personal information from a patient as always having the potential to harm; protect the information wherever it appears, including but not limited to: email, spreadsheets, sign-outs, electronic records, and paper files

- **DO** use the minimum necessary identifiable patient information when you use or share information.
- **DO** ask questions of the Privacy Office if you are not sure if a use or release of patient information is allowed.
- **DO** make sure that any device you use - computer, laptop, tablet, smartphone - is password protected, encrypted and enabled for remote wipe.
- **DO** verify security yourself and never assume any system is private and secure.

As the media continually reports, there are too many examples of failure to protect PHI to list each one, but here is a reminder of the **most common lapses in information privacy that have been reported**. Also, it can be helpful to have a "rule of thumb" for any particular action you're considering - take a brief moment and first ask yourself whether you should have the information and is access or your planned use necessary? Then, ask yourself to consider what if a "never" privacy breach happens and **DO NOT** do the following:

- **Do NOT** take paper records from the hospital or clinic and leave them unattended.

The risk: The records are stolen, and now you are responsible for unauthorized release of personal health information

- **Do NOT** send information about patients on email that is not secure.

The risk: The email is intercepted or accidentally sent to the wrong recipient, and now you are responsible for unauthorized release of personal health information

- **Do NOT** use social network venues, such as Facebook or Twitter, to communicate about patients.

The risk: The patient or patient's family, or other members of their social network, sees it, and now you are not only responsible for unauthorized release of personal health information but you have also failed in your responsibility for that patient's privacy.

- **Do NOT** receive email or text message on an unsecure smartphone.

The risk: Your phone is lost or stolen, you have no way to lock or wipe the device, and now you are responsible for unauthorized release of personal health information

- **Do NOT** take pictures of patients on your personal camera or smartphone, or any device that is not encrypted and/or password protected.

The risk: Your phone is lost or stolen, and now you are responsible for unauthorized release of personal health information

Always remember that patient care includes protection of patient privacy. Violation of your patient's privacy is a failure of your responsibilities as a physician--and a violation of state and federal regulations, with serious consequences to your career and your profession."

I hope this communication is helpful to you – it is not all we need to do (or not do) but it contains some of the most important reminders.

Tenth Anniversary of Community Health Symposium

On Thursday, October 27th the 10th Annual Community Health Symposium was held in Berg Hall in the Li Ka Shing Center for Learning and Knowledge. The Office of Community Health and the Stanford Center for Clinical and Translational Education and Research supported this important event. Special thanks for this year's event goes to Leanne Almario, SMS II, and Rachel Talley, SMS II, along with faculty and staff of the Office of Community Health, particularly Ann Banchoff, Courtney Burks, Jill Evans, Evelyn Ho, Caroline Morugan, Rhonda McClinton-Brown, Scott Schafer and Marilyn Winkleby. Equally importantly, the 10th Annual Symposium featured oral and poster presentations from undergraduates, medical students, physician assistant students, residents, fellows, staff and faculty – who presented work on communities local and global. This important symposium not only brought together our own Stanford community, it also recognized and celebrated our “Community Partners” and gave voice to the vital importance of “community” in Stanford Medicine. The work we do in research, education and patient care ultimately benefits our communities, but our communities and their leaders also enrich the lives of our students, faculty and staff. This year's keynote speaker, Phuoc Van Le, a graduate of Stanford Medical School, bore witness to this from his own life experiences in global and community health.

Appointment of Dr. Will Talbot as the Next Chair of Developmental Biology

Beginning January 1, 2012, Dr. Will Talbot, Professor of Developmental Biology, will become the next chair of the Department of Developmental Biology, succeeding Dr. Roel Nusse, who has served admirably in this role since 2007. From its founding in 1989 by Dr. Lucy Shapiro, The Ludwig Professor of Cancer Research, Department of Developmental Biology and Director of the Beckman Center for Molecular and Genetic Medicine, and Senior Fellow, by courtesy, at the Freeman Spogli Institute for International Studies, the Department of Developmental Biology at Stanford has had a remarkably stellar reputation thanks to its outstanding faculty and students. I want to thank Dr. Nusse for his outstanding leadership over the past five years – both for the department and the broader Stanford community. I also want to welcome Dr. Talbot to this new and important role. He has served as Associate Chair and has proven himself a thoughtful and highly competent leader. He was the unanimous choice of the Developmental Biology faculty to serve as the next chair of the department, and I am thrilled that he will do so.

Behavioral and Social Science Foundations for Future Physicians

Over the past several years attention has once again focused on seeking ways to enhance, develop – and even select for – humanism and professionalism in students and practitioners of medicine. At medical schools across the country, the behavioral qualities of physicians have assumed increased recognition and importance. At Stanford, ways to value and enhance the compassion and caring by physicians have been incorporated into the curriculum and have been used to assess and evaluate clinical performance. They are among the skills being assessed in the recently introduced MMI (Multi-Mini Interview) methodology used to determine an applicant's suitability for admission to Stanford Medical School (see:

<http://med.stanford.edu/ism/2011/november/5q-prober-1107.html>)

For too many of the past several decades admission to medical school has been largely based on performance in the biological and physical sciences. Major determinants for admission in many medical schools have focused on MCAT scores and GPA results. While these metrics have been

used at Stanford, the criteria and basis for admission have employed much deeper evidence of life accomplishments and “journey traveled.” Even so, a decided shift to broaden the metrics to guide medical school admission is underway nationally. This trend was **not** enhanced by the 2009 publication from the AAMC and Howard Hughes Medical Institute entitled “*Report of Scientific Foundations for Future Physicians Committee*” (http://www.hhmi.org/grants/pdf/08-209_AAMC+HHMI_report.pdf), which, in my opinion (and that of others) focused too narrowly on proficiency in the physical and computational sciences as the basis for medical study. While these skills are important, they are not exclusively so, and a much broader array of knowledge is needed to educate tomorrow’s physicians. With that goal in mind, the AAMC released on November 8, 2011 its report on Behavioral and Social Science Foundations for Future Physicians (see: www.aamc.org/socialsciencesfoundation). The driving theme is that “A complete medical education must include, alongside physical and biological science, the perspectives and findings that flow from the behavioral and social sciences.”

The report delineates the foundations for medical study from the behavioral and social sciences (which parenthetically will be included in the major revision of the MCAT exam that goes live around 2014) and gives evidence of various competencies that should be aspired to or acquired. To give you a flavor of these I copy below the “Performance Expectations for Professional Activities” that are featured on page 27 of the report. I recognize they lack a context but hope they provide some examples.

"Grounded in ‘entrustable professional activities’ concepts and modes of assessment, the descriptive profiles below illustrate performance capacities that, with proper behavioral and social science training, students should display in their intellectual and clinical work. These profiles transcend competency and knowledge domains by arraying the levels of responsibility, micro to macro, actually being entrusted to students by a performance inventory expected of an effective medical student. Behavioral manifestations will vary by setting, but the range in the array signals multiple evaluation sources appropriate for educator assessment.

Offered as aspirational in nature, not all students will be able to attain expertise in all of the activities delineated. Since these performance capacities are integrations of multiple lessons on multiple axes--cognitive, emotional, relational, values based--direct cause- effect is not straightforward. However, faculty can assess performance with emerging metrics and assessment approaches from simulation, reflection, 360-degree assessments, ethnographic field methods, and the students' actual performance.

Patient: (communication, trustworthiness, Supportiveness) Patients cared for by this student report comfort, respect, and trust in their interaction. They understand information communicated by the student, including behavioral counseling. They report that their personal, cultural, and social contexts were taken into account in their care and that their questions fully answered.

Community: (language Proficiency, Strength and needs assessment, culturally Sensitive care) The student can communicate, through interpreters when necessary, with patients in their native language, and is capable of delivering culturally appropriate care. Curious about the cultures served by the institution, the student displays willingness to act on behalf of patients and community members, who in turn find the student to be responsible, humble, and helpful.

Public/global Health: (Health Policy, Health care Justice, advocacy) The student considers health policy and economics forces when making decisions about patients or resource allocation, recognizing the potential conflicts of interest for the individual clinician. The student

understands the cultural influences on health, and contributes to efforts toward health care justice at local, community, or global levels.

Self: (knowledge growth, Self-awareness, Professional development) The student applies knowledge of population sciences, psychological dimensions of patient care, epidemiological disease patterns, and evidence-based practice guidelines. Mindful to maintain systems of self-care, the student reports an increase in self-awareness and intentional reflection, while conscious of developing professional identity.

Peers: (teamwork, collaboration in teaching and learning) The student is recognized by fellow students for peer teaching and evaluation engagement, and is found by peers to be available for peer consultation, shared learning projects, and a willingness to share expertise.

Institution: (Effective teamwork, contributions to institutional climate) Team members note respectful collaboration. The student asks for advice and guidance from non-physician colleagues, and is similarly approachable. The student shows fiscal prudence, is alert to minimize medical errors, ensure patient safety, and improve quality.

Profession: (medical Standards, integrity, altruism) The student is aware of personal boundaries in clinical work, performs clinical duties with honesty, reports clinical data truthfully, and admits personal errors. The student observes professional standards of conduct and does not violate standards such as dress, demeanor, conduct, civility, and punctuality. The student understands the need to put patients' interests ahead of personal interests and the interests of the medical profession.

Changing Face of Medicine and Science

On Saturday, October 29th the SUMC Alumni Association hosted the Changing Face of Medicine & Science. This important event featured an inspiring keynote address by Dr. Susan Blumenthal, Director, Health and Medicine Program, Center for the Study of the Presidency and Congress, and Former Assistant Surgeon General and Deputy Assistant Secretary for Women's Health in the Department of Health and Human Services. Dr. Blumenthal reviewed what has been learned from studying (or not studying) the differences between health issues in women versus men and, sadly, the fact that women's health has been so overlooked as an investment for research, education and care. She also reviewed the workforce issues in women's health and the opportunities to make the future different from the past.

In addition to the keynote presentation and the opportunity to build community among women faculty and trainees at Stanford and as well as alumnae, four breakout sessions were featured to promote discussion and future actions. These included:

- ***Changing Face of Women in Medicine***, led by Dr. Hannah Valantine
- ***Career Life Cycles, Going Beyond Balance***, led by Drs. Linda Hawes Clever and Dana Weintraub
- ***Trends in Biotechnology***, led by Drs. Lila Hope, Sandra Horning and Gail Maderis and Susan Siegel
- ***Exploring Career Options and Marketing Yourself*** led by the School of Medicine Career Center

This is the second annual event on women in medicine and science sponsored by the SUMC Alumni Association. It is great way to bring our diverse community together and to foster dialogue and opportunity. I hope this becomes a constant source for change in the future.

Update to the Executive Committee on the Stanford Institute for Immunity-Transplantation-Infection (ITI)

On Friday, October 21st, Dr. Mark Davis, Burt and Marion Avery Family Professor of Immunology and Director of the Stanford Institute for Immunity-Transplantation-Infection (ITI), led a discussion at the School of Medicine's Executive Committee on the progress that has been made on ITI, which he has so ably led since its inception. Mark provided the following summary of his presentation that I am pleased to share with you.

Established in 2005 as part of the SoM, the Institute for Immunity, Transplantation and Infection (ITI) took on the mission to promote interdisciplinary work between these largely separate disciplines that would be transformative for patient diagnosis and treatment. Since its inception the ITI has experienced significant growth, with over 100 Stanford faculty involved and is now recognized internationally as being at the forefront of translational work in these areas and a model for other institutions.

Under the direction of Dr. Mark Davis, and Associate Director Dr. Carlos Esquivel, and a very active steering committee, the ITI has as its backbone the overriding tenet that the immune system has significant impact on both morbidity and health, and therefore should be monitored and ultimately harnessed to improve the diagnosis, treatment and prevention of disease. One of ITI's principal innovations was the establishment of the Human Immune Monitoring Center (HIMC) which leverages Stanford's longstanding strength in immunology and immune assay technology to provide a way in which the entire Stanford research community can obtain critical data about the immune status of their patients in order to understand and treat the many diseases that have an immune component.

Led by Dr. Holden Maecker, the HIMC has developed a systems immunology approach that is designed for the purpose of more broadly interrogating the immunological mechanisms involved in health and disease. The HIMC consists of a core group of scientists that provide full-service immune monitoring for clinical trials and studies both within and outside the Stanford community, currently with more than 173 active projects, 15 divisions or departments in the medical school and 90 participating investigators. In addition, the HIMC has been integral in the creation and implementation of a novel database for the warehousing, integration and exploration of translational data. This database aims to allow end-user access to large pools of datasets that can be mined for insightful information.

The ITI is also part of two major U19 efforts led by the NIH and which bring together two groups of academic institutions. The first, known as Cooperative Centers for Translational Research on Human Immunology, is focused on characterizing the interaction between pandemic viral pathogens such as Influenza and their human host. The second program group, called the Human Immunology Project Consortium is charged with profiling the human immune response to a variety of currently used vaccines in different populations.

In addition to government funding, the ITI also generates support from non-federal sources, such as the Gates Foundation, private contracts, as well as generous philanthropic donations to support faculty in its core areas. The ITI has also been working to promote translational research

and training through 19 seed grants that have been awarded since 2009 across a variety of disciplines, including infectious disease, autoimmunity, allergy, transplantation, primary immunodeficiency, neurology and inflammatory pain. As a direct result of these funding endeavors, aspects of patient care have already benefited, for example in the ability to maintain tolerance in transplant patients without the use of immunosuppressive drugs, and in the validation and implementation of novel approaches for achieving oral tolerance in individuals with severe food allergies.

Through a special seed grant program for younger investigators, ITI also has been able to recognize 7 later stage research and clinical fellows, providing support and encouragement to the next generation of leaders. ITI member-PIs have formed 12 working groups representing a wide range of medical and research expertise in order to facilitate cross-fertilization of ideas and techniques. Additionally, ITI sponsors a number of symposiums offered at the SoM, which this year included the 45th annual US-Japan meetings on Virology and Immunology, Nanotechnology in Medicine and the 3rd Human Immunology Project Consortium meeting.

A Summit on Bicycle Safety

On Wednesday, November 9th the First Stanford Trauma Bike Safety Summit was held in the Li Ka Shing Center for Learning and Knowledge. The Summit brought together Stanford faculty leaders with representatives from law enforcement and the fire department, the transit commission and the motor vehicle department along with leaders and advocates from the biking community for an engaging discussion. The goal was to improve bike safety in the broader community – focusing especially on off campus areas, where the cycling community not infrequently encounters serious accidents, injuries and even fatalities. As stated, the goal of the Summit was to *“identify and address the causes of preventable bicycle crashes and plan for solutions to reduce them through focused efforts in education, enforcement, engineering and evaluation.”* In doing so the participants hoped that *“we can take steps needed to change local road culture and improve safety for all.”* I had the opportunity to attend nearly the entire Summit, and I was pleased by the candor and commitment of those in attendance to achieve greater safety for the biking community.

The Summit was really focused outward on the surrounding communities and not on the culture of bicycle safety on the Stanford campus. I called attention to this problem as well – which despite the considerable efforts of many committed individuals still remains a serious problem. As I have noted on numerous occasions, my own (nearly daily) survey still shows less than one in ten bikers wearing helmets, relatively few with visible lights during night driving and many still ignoring road or traffic signs. Every day is another opportunity for a serious – and in most cases – preventable accident.

I have recounted efforts by our students to elevate the culture of bike safety at the medical school – but I am still shocked and appalled by the number of individuals I observe every day who still ignore bike safety themselves – or for others. While I certainly agree that we can never offer enough education about bike safety, it seems clear that more is necessary to ensure a cultural transformation. While I don't know where it will go, I was pleased that the attendees of the University Cabinet listed bike safety as a topic needing broader discussion at the university level. I am very eager to participate in that discussion since the current situation on campus remains woefully unsafe.

President Hennessy Honors Dr. Paul Berg

On Thursday, November 3rd President John Hennessy and Andrea Hennessy hosted a small dinner event to thank **Dr. Paul Berg**, Vivian K. and Robert W. Cahill Professor in Cancer Research, Emeritus, for his extraordinary contributions to Stanford and our communities locally and globally. Dr. Berg's contributions to science, medicine and education remain nonpareil. But what makes Paul Berg truly unique is his humanism, compassion and commitment to others and to our community. For all of his many accomplishments, Paul Berg remains one of the most humble and accessible leaders of our community. His lack of arrogance is inversely related to his extraordinary intellect and scientific achievements. His generosity to the medical school includes his and his wife Millie's philanthropic contributions along with the enduring support he has provided through his teaching, mentoring, advocacy and support. On a personal note I am deeply grateful to Paul Berg for all the incredible support and thoughtful counsel he has provided to me since I joined Stanford over a decade ago. I was deeply honored to share in the wonderful celebration and recognition that President Hennessy offered to Paul Berg – clearly so well deserved in every way.

The Department of Pathology Celebrates the David Korn Professorship

On Wednesday evening, November 2nd we had the pleasure of celebrating the David Korn Professorship in Pathology and its first incumbent, Dr. Gerry Crabtree. This new professorship was made possible through the Department of Pathology and honors Dr. Korn, who joined Stanford as the Chair of Pathology in 1969, a position he held until 1984, when he became dean of the School of Medicine. **Dr. Korn** is credited for building *“a premier department, notable for its outstanding training programs in anatomic pathology and its focus on cutting-edge experimental pathology research. In addition to his substantial administrative duties, he also directed a productive research lab.”* Following his years of distinguished leadership in pathology, Dr. Korn served as the Dean of the School of Medicine and then Vice President for Medical Affairs. He has left an enduring mark on Stanford that stands to this day – and will continue well into the future.

It is also wonderful to celebrate **Dr. Gerry Crabtree** as the first incumbent of the David Korn chair. Dr. Crabtree, an Investigator in the Howard Hughes Medical Institute and a leading investigator on the origin of biologically specific patterns of transcription and information transfer from the cell membrane to the nucleus, epitomizes the excellence and esteem that is consonant with the David Korn professorship.

Please join me in congratulating both Drs. Korn and Crabtree.

Honoring Drs. Laura Roberts and Ronald Dalman with Endowed Professorships

On Tuesday, November 1st we celebrated the investiture of **Dr. Laura Roberts** to the Katherine Dexter McCormick and Stanley McCormick Memorial Professorship and **Dr. Ron Dalman** to the Walter Clifford Chidester and Elsa Rooney Chidester Professorship.

The Katherine Dexter McCormick and Stanley McCormick Memorial Professorship was established by a bequest made to Stanford in 1969 by Mrs. Katherine Dexter McCormick. The gift was made in memory of her husband, Stanley McCormick, whose father's company later became the International Harvester Company. Ms. McCormick was a lifelong champion of

women's suffrage and women's reproductive rights and welfare, and a co-founder of the League of Women voters. In bequeathing the funds to Stanford, she expressed the hope that they could be used "for the encouragement and assistance of women in pursuing the study of medicine, and in engaging in medical research." **Dr. Laura Roberts** became the Chair of the Department of Psychiatry and Behavioral Medicine in 2010. She is an internationally recognized scholar in bioethics, medicine, and medical education and one of the foremost psychiatric ethicists in the field. Her work has led to advances in understanding the ethical aspects of physical and medical illness research, societal implications for genetic innovation the role of stigma in health disparities, the impact of medical student and physician health issues, and optimal approaches to fostering professionalism in medicine.

The Dr. Walter C. Chidester Professorship was established by a bequest from the estate of Elsa R. Chidester in honor of her deceased husband. Walter Chidester, MD supervised the construction and activation of Mills Memorial Hospital in San Mateo and, until the time of his death in 1968, was chief of staff. **Dr. Ron Dalman** joined the Stanford faculty in 1989 and became Chief of Vascular Surgery in 2005. His research has focused on the influence of variable aortic hemodynamic conditions on abdominal aortic aneurysm pathophysiology. He is an expert in this field as a clinician, investigator and mentor.

Please join me in congratulating Drs. Laura Roberts and Ron Dalman.

Upcoming Event: A Memorial Service for Dr. Gary Glazer Will be Held On December 3rd at 4 pm.

On Saturday, December 3rd a Memorial Service will be held to commemorate the life of Dr. Gary Glazer who served as Professor and Chair of the Department of Radiology from 1989 until his death on October 16, 2011. A summary of Dr. Glazer's remarkable career was recently summarized at <http://med.stanford.edu/ism/2011/october/obit-glazer.html><http://med.stanford.edu/ism/2011/october/obit-glazer.html>. The service will be held at the Knight Management Center, 655 Knight Way, in the **Cemex Auditorium**. A reception will immediately follow at Oberndorf Event Center, 3rd floor located above the Cemex Auditorium. Underground parking is available. Enter from Campus Drive East, across from the parking lot adjacent to Maples Pavillion.

If you are planning to attend please RSVP to Michelle Christerson at m.christerson@stanford.edu or at (650) 723-7863.

Holiday Food and Toy Drives

The Dean's Office is once again having a food drive to benefit Second Harvest Food Bank of Santa Clara and San Mateo Counties. By participating we have the opportunity to assist those in our community who are struggling to make ends meet and ensure that no child, family or senior goes hungry.

Please join us in this effort to feed our neighbors who, each month, have to decide between paying for rent, utilities, or medicine and providing food for their loved ones. Through your generosity we can help feed the nearly one quarter of a million people that Second Harvest Food Bank of Santa Clara and San Mateo Counties assists each month.

Drop off food donations in the barrels located at LKSC, 1st floor and the Dean's Office, LKSC, 3rd floor.

Please note the most needed food items:

- Meals in a can (stew, chili, and soup)
- Peanut butter
- Cans with pop top lids
- 100% fruit juices
- Canned fruit
- Canned vegetables
- Tuna/canned meat
- Low-sugar cereal

The Dean's Office will also be collecting donations for children who will be inpatients at the Lucile Packard Children's Hospital during the holidays. We are sensitive to the many celebrations at this time of year, and will work with the Office of Child and Family Life Services and the various chaplains to ensure that all children are recognized. Your gift of a new toy, clothing item, or craft supplies will go a long way towards brightening a child's hospital stay.

The gifts have to be brand new and unwrapped. The greatest need is donations for preemies, infants, and adolescents. Donations will be collected in the Dean's Office and the main lobby of the LKSC by the receptionist's desk from November 28th through December 9th. Donation "Wish List" will be available at the collection sites.

Thank you in advance for your participation!

Awards and Honors

- **Dr. Anne Brunet**, Associate Professor of Genetics, has been selected as the 2012 recipient of the AFAR (American Federation for Aging Research) Cristofalo "Rising Star" Award. Dr. Brunet is an expert in the science of aging and her recent work (<http://med.stanford.edu/ism/2011/october/brunet.html>) has received considerable acclaim and attention.
- **Dr. Lisa Pate, MD, JD**, of the Department of Pathology has been chosen as one of the KQED Local Heroes for 2011. According to the press release, "Lisa was chosen for her years of leadership and dedicated work on behalf of the Santa Clara Valley Indian community." Dr. Pate received her MD degree from Stanford School of Medicine in 2006. She will receive her award at a ceremony on November 17th.
- **Dr. Julie Parsonnet**, George DeForest Barnett Professor in Medicine and Professor of Health Research and Policy (Epidemiology), was selected to give the Maxwell Finland Lecture at the 49th Annual Infectious Disease Society of America Meeting. Being invited to give this lecture is in recognition of Dr Parsonnet's seminal contributions to Infectious Diseases, epidemiology, and her work linking infections to chronic diseases.
- **Dr. Michael F Marmor**, Professor of Ophthalmology, was awarded the 2011 Award of Merit in Retina Research, in conjunction with the Charles L. Schepens lecture at the annual meeting of the Retina Society in September. This award was established to

recognize outstanding vision scientists whose work contributes to knowledge about the retina and retinal diseases.

Appointments and Promotions

Ranjana H. Advani has been promoted to Professor of Medicine at the Stanford University Medical Center, effective 11/1/2011

Manuel Amieva has been promoted to Associate Professor of Pediatrics and of Microbiology and Immunology, effective 11/1/2011

Matthew W. Anderson has been appointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 11/1/2011

Tandy Aye has been reappointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 12/1/2011

Joanna C. Badger has been promoted to Clinical Associate Professor of Dermatology, effective 10/1/2011

Renna Bhargava has been reinstated and reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2010

Nidhi Bhutani has been appointed to Assistant Professor of Orthopaedic Surgery, effective 11/1/2011

Matias Bruzoni has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 11/1/2011

Ching-Pin Chang has been promoted to Associate Professor of Medicine, effective 11/1/2011

Clara Y. Choi has been reappointed as Clinical Assistant Professor of Neurosurgery, effective 5/1/2011

Justin Choi has been reappointed as Clinical Assistant Professor (Affiliated) of Surgery, effective 9/1/2011

Catherine M. Curtin has been reappointed to Assistant Professor of Surgery at the Stanford University Medical Center effective 1/01/2012

Vinicio de Jesus Perez has been appointed to Assistant Professor of Medicine, effective 11/1/2011

Sumbul Desai has been promoted to Clinical Assistant Professor of Medicine, effective 11/1/2011

Dan Eisenberg has been reappointed to Assistant Professor of Surgery at the Veterans Affairs Palo Alto Health Care System effective 12/1/2011

Gregory M. Enns has been reappointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 11/1/2011

Joseph Garner has been appointed to Associate Professor of Comparative Medicine at the Stanford University Medical Center, effective 10/1/2011

Pejman Ghanouni has been appointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 1/01/2012

Jason R. Gotlib has been promoted to Associate Professor of Medicine at the Stanford University Medical Center, effective 10/1/2011

William Greenleaf has been appointed to Assistant Professor of Genetics, effective 11/1/2011

Arun Gupta has been reappointed as Clinical Assistant Professor of Pediatrics, effective 9/1/2011

Ciara D. Harraher has been promoted to Clinical Assistant Professor of Neurosurgery, effective 10/1/2011

Kathleen Horst has been reappointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, effective 12/01/2011

Dimitre H. Hristov has been reappointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, effective 11/01/2011

Michele Hugin has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2011

Jemmy Hwang has been reappointed as Clinical Assistant Professor (Affiliated) of Surgery, effective 9/1/2011

Shelli Kesler has been reappointed to Assistant Professor (Research) of Psychiatry and Behavioral Sciences effective 12/1/2011

Elizabeth Kidd has been appointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, effective 11/1/2011

Lucy Kim has been reappointed as Clinical Assistant Professor (Affiliated) of Surgery, effective 9/1/2011

Lisa Lee has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 7/1/2011

Yiming Lit has been reinstated and reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 7/1/2010

Paul M. Maggio has been reappointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 12/01/2011

Laura McClellan has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2011

Michelle Monje-Deisseroth has been appointed to Assistant Professor of Neurology, effective 11/1/2011

Yasodha Natkunam has been promoted to Professor of Pathology at the Stanford University Medical Center, effective 11/1/2011

Anthony E. Oro has been promoted to Professor of Dermatology, effective 10/1/2011

Oxana G. Palesh has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 11/1/2011

Hemal Parekh has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2011

Sonia Partap has been promoted to Clinical Assistant Professor of Neurology and Neurological Sciences, effective 1/1/2012

Nilima Ragavan has been reappointed as Clinical Assistant Professor of Pediatrics, effective 9/1/2011

Jeffery H. Reese has been reappointed as Clinical Professor (Affiliated) of Urology, effective 9/1/2011

David Rehkopf has been appointed to Assistant Professor of Medicine, effective 11/1/2011

Olaf Reinhartz has been promoted to Associate Professor of Cardiothoracic Surgery at the Stanford University Medical Center and at the Lucile Salter Packard Children's Hospital, effective 10/1/2011

Susan Schelley has been appointed to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 8/1/2011

Weiva Y. Sieh has been reappointed to Assistant Professor of Health Research and Policy, effective 11/1/2011

Bindya S. Singh has been promoted to Clinical Associate Professor (Affiliated) of Pediatrics, effective 11/1/2011

D. Scott Smith has been promoted to Adjunct Clinical Associate Professor of Microbiology and Immunology, effective 01/01/2012.

Matthew W. Smuck has been promoted to Associate Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 10/1/2011

Randall Stafford has been promoted to Professor of Medicine effective 11/1/2011

Mary Teruel has been appointed to Assistant Professor of Chemical and Systems Biology, effective 11/1/2011

Monte Winslow has been appointed to Assistant Professor of Genetics, effective 11/1/2011

Dana M. Weisshaar has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2011

Carl F. Yaeger has been promoted to Clinical Assistant Professor of Pediatrics, effective 1/1/2012

Andrew R. Zolopa has been promoted to Professor of Medicine at the Stanford University Medical Center, effective 11/1/2011

Dean's Newsletter

December 12, 2011

Thank You

At this time of the year one often hears comments about how quickly the year has gone by – and also how time seems to go by faster as one ages. While I can relate to both of these statements, there is something more timeless that I want to comment on at the year's end, and that is my deep gratitude and appreciation for the quality and performance of our extraordinary Stanford Medicine community. For nearly eleven years I have had the honor and privilege to work with you and to witness, not infrequently first hand, the extraordinary accomplishments and achievements that are made every day in so many different ways, small and large, but that come together to make our institution unique. We are all too cognizant of the vast challenges facing the United States and the world today, and we certainly can anticipate the coming changes that will almost certainly impact academic medicine as we have known it. I am confident that we will weather whatever storms arrive and that new innovations and discoveries at Stanford will see the light of day and advance the health and wellbeing of people in our community and beyond.

I am appreciative of the guiding leadership of our department chairs, institute and center directors, decanal leaders, faculty, students and trainees and for their dedicated and committed efforts to all facets of the medical school, medical center, university and community. I especially want to thank our exceptional cadre of staff, who labor tirelessly to weave our individual and collective contributions into the integrated whole that defines Stanford Medicine. While our staff are frequently less visible, none of what we do would be seen without their hard work, dedication and commitment. So, at year's end I want to say thank you to each of you for your personal and

shared efforts to make the Stanford School of Medicine the shining beacon of hope and promise it has become. I also wish you a Happy Holiday and look forward to sharing the New Year with you.

Some Things to Consider During Winter Break

On December 5th we had the pleasure of hosting a holiday celebration in Berg Hall at the Li Ka Shing Center for Learning and Knowledge. This was the first such holiday event we held since 2008, when the economic downturn compelled us to cut back on events not directly linked to our core missions in education, research and patient care. Of course it was correct to cut out social events when resources were extremely strained, but that also meant that we missed the opportunity to bring our community together in settings that offered thanks and appreciation. So it was meaningful that we were able to have a modest holiday celebration at the close of 2011. I want to thank Mira Engel, Executive Assistant to the Dean, and other members of the dean's administrative and office staff for the lovely organization and preparations they put together for the holiday party. It was very special.

The Holiday Party did provide an opportunity to offer some suggestions for the University-wide Winter Break, which will run from December 19th through January 2nd. Because of the broad scope of our work, I know that many of us will be working on research, patient care or other activities. But I also recognize that Winter Break has become one of the traditions at Stanford when we can give each other the gift of time and space. This means completing all tasks, including grant and related submissions, well before December 16th so that staff do not face unnecessary work pressures during what is meant to be a relaxed (although still stressful) time for families. One particular tradition that we should honor is taking a break from email or other electronic communications that are not prompted by emergencies. And if an email is needed think carefully about who is copied. We can help each other by not triggering the chain of email communication, response, etc. by simply limiting the communications we take for granted in our daily work life. Indeed, as electronic communications have become so easy and accessible, their intrusion is constant and sometimes unwelcome. ***So, starting on the evening of December 16th I would recommend that each of us refrain from sending emails to members of our Stanford community unless there is an emergency or crisis.*** That would be a welcome gift for many of us.

In addition, there are some important facts you should be aware of about medical school facilities during winter break prepared by our Facilities Planning Office. They are included here:

Some Things to Know About Facilities During Winter Break

December 19, 2011 -January 2, 2012

During the winter closure all buildings will be locked and only accessible through badge access. The following is an overview of School of Medicine operations during Winter Closure and some important announcements.

All campus services will be closed during the following days: Friday December 23 through Monday, December 26th and Monday January 2nd. For life threatening emergencies, if on-campus, please dial 286 from Stanford phones or 650-723-7222 from cell phones. From off-campus buildings, dial 911 from Stanford phones or cell phones. Then dial 650-723-7222 to report the incident to Security.

For non-life threatening and other immediate needs, please call the security desk at 650-723-7222

If you are on campus during Winter Break, please be careful. Statistics consistently show a higher frequency of workplace accidents during the holiday season. Plan your work carefully and avoid attempting tasks requiring additional resources that are not available. Please be diligent regarding security in all you do.

During other days of winter closure between December 19th and January 2nd, some campus services will be available as listed below.

Security: Dial (650) 723-7222 for any emergency from on campus phones

Operations and Maintenance: Request assistance by accessing medfacilities.stanford.edu (select links on left menu and then eAM work request form) or call (650) 721 2146. For immediate assistance on weekends, holidays and after hours (7:30 PM to 6:00 AM) call Security at 723 7222.

Health and Safety: Dial (650) 723-0110 for Health and Safety issues and other non-emergencies

Shipping and Receiving: The loading dock will be closed for the duration of the winter break. The dock will reopen on January 3rd.

UPS and Fed-X will be holding all packages at their hub and will deliver the packages when we reopen on January 3rd. Other vendors like Fisher and VWR will also deliver all packages after the winter closure. Praxair and Airgas will still make deliveries as normal.

Please make prior arrangements with the carrier and/or delivery service for accepting packages during the winter closure period if the delivery is deemed urgent. If you are expecting a large shipment that requires delivery to the dock, please make arrangements in advance by contacting the loading dock at (650) 721-2726 before December 15th.

SAVE ENERGY: You can do your part in helping make Stanford University more sustainable by saving energy. Simply:

1. Turn off as many lights as safely possible
2. Close doors and windows (if applicable)
3. Turn off - or better yet, unplug any devices or equipment including computer and monitor: The “sleep” mode saves some energy but a complete shutdown and power off saves much more
4. Same with printers, scanners, and other peripherals
5. Anything with a “brick” on the power cord. They use power even when the devices are turned off.
6. Turn off/unplug shared copiers, printers and FAX machines
7. Unplug any scientific equipment that will not be used
8. Close the sash on all fume hoods. The unnecessary exhaust to the outside consumes an enormous amount of energy.

A Few Brief Reflections on 2011

Our faculty, students and trainees, and staff have had another extraordinarily successful year of notable contributions to our interconnected missions in education, research and patient care, both locally and globally.

Despite the impact of the economic downturn on sponsored federal research, Stanford faculty achieved 9% more funding this year than last year. Our faculty continues to achieve recognition as recipients of major national and international awards and through election to the National Academy of Sciences and Institute of Medicine. Without question we have one of the most outstanding bioscience research faculty in the world, and the contributions being made by faculty and their students and postdoctoral fellows at virtually every stage of career development are remarkable.

Our faculty have also continued to excel in translating novel discoveries to improve the lives of adults and children and in creating novel ways to improve the delivery of patient care. During this past year the School of Medicine (SoM) has worked closely with the leaders at Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH) to develop integrated strategic plans that engage the School's missions in discovery and innovation with the hospitals' mission of delivery of complex care and a network of care. Significant progress has been made in the planning of our integrated Stanford Cardiovascular Institute and its Cardinal Health led by Drs. Alan Yeung, Bobby Robbins and Ron Dalman in collaboration with Dr. Sri Seshadri. Progress is also being made in the integrated planning for the Stanford Cancer Institute led by Drs. Bev Mitchell, Doug Blayney and Sri Seshadri. Work is also beginning for the Stanford Neuroscience Institute initiative led by Drs. Gary Steinberg and Frank Longo along with Alison Kerr. These and related areas will help forge our efforts in adult complex care. Similar efforts are underway in pediatrics.

Our faculty have also made progress in setting up novel delivery systems for health care, including the Ambulatory ICU model that was conceptualized by Dr. Arnie Milstein and that is now being established in a collaboration between SHC and SoM. In addition, progress has been made expanding the network of care through the University Health Alliance. In these and many other efforts we have benefited from the energetic and exceptionally collaborative leadership of Amir Rubin, who joined SHC as its new President and CEO in January of 2011. In addition to his leadership in strategic planning and focus on coordinated complex care and a coordinated network of care, Amir has been an incredible leader and advocate for improving the patient experience through CI-CARE, a comprehensive program he helped develop and lead at UCLA before joining Stanford. We have continued to make progress, albeit with challenges, in improving our overall quality of care and have benefited from the leadership of Dr. Norm Rizk (who has been functioning as Interim Chief Medical Officer in addition to his long-standing role as Senior Associated Dean for Adult Clinical Affairs) and Dr. Ann Weinacker, who currently serves as the elected Chief of Staff at SHC.

A complementary strategy in complex care and a network of care is underway with LPCH in collaboration with Christopher Dawes, President and CEO, along with Dr. Christy Sandborg, Chief of Staff, and Dr. Ken Cox, Senior Associate Dean for Clinical Affairs/Pediatric and Obstetrics. Mr. Dawes presented the vision and goals of the LPCH-Stanford strategic vision to the Medical Center Committee of the Stanford University Board of Trustees on December 12th.

Given tremendous opportunities as well as challenges unfolding in health care – along with the uncertainties of how health care reform will actually unfold over the next several years—the integrated partnership between the School of Medicine, SHC and LPCH is essential and affords us an opportunity to be leaders in unique and important ways. By capitalizing on our unique capabilities in innovation and discovery, our expanding and ever more outstanding physician

leaders and clinical faculty, and our shared efforts in improving the quality of care, the patient experience and the value benefit, we are positioned to create a better vision for the future than the fragmented care system that exists now in our country. The current system, fueled as it is by the “fee-for-service” payment system, is really no system at all – although the Affordable Care Act of 2010, with all its imperfections, was at least a start.

It is clear that over the next several years we will need new tools and insights in the broad field of population sciences. Over the past several years a number of important recruitments have added excellence to a superb faculty in this area that expands across the university. However, until now, these faculty have operated in individual or small spheres of excellence without integrating principles or coordination. Thanks to the work of our Stanford Clinical and Translational Science program, led by Dr. Harry Greenberg, Senior Associate Dean for Research, which coordinates activities across the University, our efforts in population health science are becoming better defined. This is timely indeed – given the increased emphasis funding agencies are placing on innovations in population health sciences. With that in mind, the planning activities in Population Health Sciences over the past year, which have been coordinated by our Office of Institutional Planning led by David O’Brien, have the potential for significant and important outcomes. This will be an important topic at our Strategic Planning Leadership Retreat on January 20-21, 2012.

The field of population health sciences embraces a number of fields (from statistics and epidemiology to informatics, health outcomes, disparities, policy, and healthcare delivery– and more). Stanford is also unique in being able to bring into this equation the enormous technical and basic science advances in genomics and genetics that are being articulated in the Center for Genomics and Personalized Medicine led by Drs. Mike Snyder and Steve Galli. Complementing this are the major advances in early diagnosis led by Dr. Sam Gambhir and his colleagues in molecular imaging – along with the remarkable skills and talents that exist at Stanford in computational biology and informatics.

Given the incredible strengths at Stanford in basic science (which is very much our defining excellence) along with the cross-cutting interdisciplinary research led by our Institutes of Medicine and Centers (each of which have made remarkable contributions this past year), Stanford continues to shed light on basic human biology. Importantly, the growing number of connections among basic research, clinical and translational research and now, increasingly, population health science research, fosters incredibly rich areas of interaction and insight. Indeed 2011 has continued to foster these connections both broadly and deeply.

Just as technology, innovation and discovery are transforming our research agenda and our delivery of patient care, major changes are also taking place in how we think about the education of medical and graduate students – separately and together. Major initiatives are underway by Dr. Charles Prober, Senior Associate Dean for Medical Education, and his colleagues, and this past year has witnessed some intriguing innovations that have caught the attention of medical schools and educators across the US and around the world. This too will be a topic at our January leadership retreat as well as a summit we will host in March with selected medical school peers.

Over the past year we have had a lot of discussion and debate about graduate student and postdoctoral fellow education and training, and a number of initiatives are underway led by Dr. Dan Herschlag, Senior Associate Dean for Graduate Education and Postdoctoral Affairs, and Dr.

Tom Clandinin, Director of CGAP (Committee on Graduate Admissions and Policy). Progress has been made in formulating new approaches for curriculum development in the biosciences – again a topic for further dialogue in early 2012.

In addition to progress in research, education and patient care, we have continued to benefit from inspired leadership and commitment throughout the School of Medicine. In 2011 we welcomed four new department chairs: Dr. Sam Gambhir as Chair of Radiology, Dr. Quynh Le as Chair of Radiation Oncology, Dr. Tobias Meyer as Chair of Chemical and Systems Biology and Dr. Peter Sarnow as Chair of Microbiology and Immunology. At the beginning of 2012 Dr. Will Talbot will become Chair of Developmental Biology, and we are anticipating naming new Chairs of Bioengineering, Urology and Medicine early in the new year. We benefit tremendously from great leadership and even more so from the individual and collective contributions and leadership throughout our Stanford Medicine community.

In 2011 we also became leaders in academic social networking with the launch of CAP-Network, thanks to the efforts of Michael Halaas, Dr. Henry Lowe and the office of Information Resources and Technology. In addition to all that is happening in our community at Stanford, our Offices of Community Health (led by Rhonda McClinton-Brown and Dr. Marilyn Winkleby) and of Global Health (led by Dr. Michele Barry) have created numerous new programs and connections – regionally and worldwide. Importantly, without offering a specific opinion, I am grateful for the contributions of our faculty and students for their dedication and contributions to the discourse that was initiated on December 9th in ***Occupy the Future*** (<http://studentaffairs.stanford.edu/haas/occupythefuture>). Stanford is an incredible community of scholars and their contributions to improving social justice and equity in the US and the world are incredibly important and critically needed.

These brief reflections are just that - some loosely connected remembrances of how our faculty, students and staff are working to make the world a better place. I am awed by their contributions and honored to be part of their community.

Coming January 13th at 9 pm on PBS: Anna Deveare Smith's "Let Me Down Easy"

On Friday, January 13th at 9 pm (check local listing) Anna Deveare Smith's acclaimed ***"Let Me Down Easy,"*** which examines the body and body politic will be shown on Great Performances. A former Stanford faculty member, Anna Deveare Smith is recognized as one of America's most gifted and talent artists and visionaries. The Great Performances production of *Let Me Down Easy* was recorded in February 2011 in the Kreeger Theater at Arena Stage in Washington DC. This performance launched a national tour that included California, during which she visited Stanford and was interviewed by Paul Costello, Executive Director of Communications and Public Affairs (see: http://med.stanford.edu/news_releases/2006/october/deavere.html). I am taking the liberty of including some background information from the recent announcement of this forthcoming presentation.

*"Having been credited with creating a new form of theater, to create **Let Me Down Easy** Smith interviewed an eclectic group of people (300 on three continents) and performs several in an evening that is funny, moving and engaging.*

The title resonates on several levels reverberating with meanings of lost love, the faith that sustains people in times of difficulty, and ultimately, the end of life.

Smith, through her chameleon-like virtuosity, creates an indelible gallery of portraits, from a rodeo bull rider to a prize fighter to a New Orleans doctor during Hurricane Katrina, as well as boldface names like former Texas Governor Ann Richards, legendary cyclist Lance Armstrong, network film critic Joel Siegel, and supermodel Lauren Hutton. She performs 19 characters in the course of an hour and thirty-five minutes. Their stories are alternately humorous and heart-wrenching, and often a blend of both. Building upon each other with hypnotic force, her subjects recount personal encounters with the frailty of the human body, ranging from a mere brush with mortality, coping with an uncertain future in today's medical establishment, to confronting an end of life transition. The testimony of health care professionals adds further texture to a vivid portrayal of the cultural and societal attitudes to matters of health.

With keen observation and understated compassion, Smith – without judgment and maintaining the dignity of her subjects at all times — effortlessly submerges her own persona, and assumes her characters' vocal and physical mannerisms with unerring accuracy.

Despite the profound poignancy of the issues at hand, Smith leavens the evening with many lighter anecdotes, some outright hilarious: choreographer Elizabeth Streb recounts how she accidentally set herself on fire as part of an elaborate birthday celebration; Smith's own Aunt (Lorraine Colman) recalls the last (and distinctly unsentimental) words uttered by her elder sister; and when a Yale School of Medicine oncology fellow informs cancer patient Ruth Katz that the hospital has lost her records — he is dumbfounded to discover she is actually the associate dean of the medical school there. Other characters address the intensity of the will to live even in the face of dire sickness: University of Notre Dame musicologist Susan Youens rhapsodizes on the Adagio from Schubert's String Quintet in C Major, one of over a thousand works Schubert composed before his untimely death at age 31; and while undergoing chemotherapy, Ann Richards defiantly tells of learning how to hang up the phone to preserve her precious "Chi."

Called "the most exciting individual in American theater" by Newsweek magazine, Smith (Fires in the Mirror, Twilight: Los Angeles) turns on this occasion to tell a powerful story which points to the financial and psychological cost of care, the preciousness of life and the inevitability of our mortality.

"Even in the darkest hour, even where the crisis is the greatest, you'll often find people who have the gift of grace, the gift of kindness, the gift of healing," Smith observed. "Ultimately, through this play I am trying to spark a conversation that is easier, and maybe more enjoyable to have through art and entertainment than through politics."

***Let Me Down Easy** was inspired by work she did at Yale School of Medicine, where she was invited as a visiting professor. Bill Moyers dedicated a full hour segment to profiling Ms. Smith and **Let Me Down Easy**, noting with amazement how her play transformed "a houseful of strangers" into "an intimate community."*

Facilities and Master Planning 2011 and Beyond

While the dramatic changes to our medical school facilities that concluded 2010 are not as evident in 2011, an amazing amount of large and small facilities projects and capital planning is underway – with a lot more to come in the years ahead. At the Executive Committee on December 2nd, Niraj Dangoria, Associate Dean for Facilities Planning, and Marcia Cohen, Senior Associate Dean for Finance and Administration, provided an excellent and comprehensive

update on space and facilities projects and planning now underway or coming in the next year(s). In many ways we are at the beginning of the most significant construction projects in the history of the Medical Center and University. Indeed over the next 5-10 years the Medical School and Medical Center, along with the surrounding university, will be further changed and in spite of inevitable challenges and disruptions along the way, will prepare the way for future students, faculty, staff – and of course the patients we care for and serve.

As we get ready to begin 2012, it is important to recognize that over the next 5-6 years the Stanford University Medical Center (SUMC) will be literally and figuratively transformed. In June 2011, following six years of planning, the City of Palo Alto approved the “entitlements” for SUMC including Stanford Hospital & Clinics, the Lucile Packard Children’s Hospital and the School of Medicine projects located in Palo Alto (<http://stanfordhospital.org/newsEvents/newsReleases/2011/city-council-approves-renewal.html>). With this approval in place, projects could now move ahead. Following is a summary of some of the ongoing and planned facilities projects around the School of Medicine, within the Medical Center and just outside our perimeters. Within the Medical Center alone (of course including both SHC and LPCH along with the School) we are looking at well over \$4 Billion in capital expenditures. Clearly this seems staggering – but a number of the most significant of these projects are already underway. Here is some of what is happening:

Immediately Around Us

Just as the Medical School has undergone a major physical transformation during the past several years, so too has virtually the entire University – with more changes still to come. Among the highlights have been a new campus for the Graduate School of Business at the Knight Management Center, a new Law School complex, the new Munger Graduate Housing facilities, the John A. and Cynthia Fry Gunn Building, and the new Science and Engineering Quad, which virtually adjoins the School of Medicine and where the new Bioengineering/Chemical Engineering Building is now under construction – a project shared with the School of Medicine. In addition to new athletic facilities – including a new center now under construction in the Panama corridor and Santa Theresa, work is rapidly advancing on the Performing Arts Center on Campus Drive between Palm Drive and Galvez and the new Arts District just east of the School of Medicine along Porter Avenue.

Over the next couple of years, construction will begin on a new Biology Building just east of the Clark Center. This building will create important east-west axes joining the Medical School with the life and physical sciences and the north-south corridors that join medicine to engineering and environmental sciences. These are extraordinary physical alignments that when complete will further achieve the integration of Stanford University. Over the not too distant horizon (within 5 years) the Cogen plant (energy facility) that is just south of the Li Ka Shing Center for Learning and Knowledge will be relocated to a new site – opening the way for new academic facilities that will further connect other schools to the Medical School. That should open the way to the elimination of Campus Drive to the south of the Medical School, which will create new connections and corridors to the “main campus” – removing the “other side of the campus” mindset that demarcated the “west campus” for decades. This will be made feasible as new traffic patterns emerge around the medical center.

In, Under and Around Us

Of course the big news in our midst is the beginning of the major hospital construction projects at SHC and LPCH. Already the landscapes have changed dramatically as the Welch Road infrastructure projects get underway and with the site preparations for the LPCH expansion (already marked by the demolition of the 701 and 703 Welch Road buildings that once housed a number of medical school faculty and staff). The traffic congestion is significant and regular alerts are being circulated as Hospital Renewal reminders (add <http://stanfordhospital.org/rebuild/>). Work on the construction of a new parking facility at the Hoover Pavilion site on Quarry Road is getting underway and the Day Care Center previously housed at the Hoover site is being relocated to a site near Stock Farm Road.

Several important new medical school facilities on Welch Road are underway or will be during the next year or so. The Jill and John Freidenrich Center for Translational Research (FCTR), located at 800 Welch Road, is the closest to completion; it is slated for occupancy in June 2012. Thanks to the excellence of our facilities staff, this major project is proceeding on schedule and budget. When it opens it will house over 150 research nurses and coordinators and 36 infusion centers to support the Stanford Cancer Institute and the Stanford Center for Clinical and Translational Science. The proximity of the FCTR to the Stanford Cancer Institute and the hospitals is notable and important for facilitating our growing efforts in clinical and translational research. These programs will be further enhanced by our ongoing planning in population health sciences, as described above.

In addition, thanks to a major gift from Dr. CJ Huang, the School of Medicine is now in active planning at an adjoining and companion site, 780 Welch Road, where we will build a 32,000 gross square foot (gsf) building (about the same size as the FCTR). An anchor tenant will be the Asian Liver Center led by Dr. Sam So, Lui Hac Minh Professor of Surgery. The design and planning of the Huang Building will begin in January 2012, with construction planned to begin in early 2013 and occupancy in the spring of 2014. Taken together, the Freidenrich Center and the Huang Building will establish a strong footprint for the medical school's clinical and translational research programs within the medical center. These are all very exciting developments.

Less visible on the surface have been the major strategic planning efforts for animal research facilities. Led by Dr. Sherril Green, Professor and Chair of the Department of Comparative Medicine, along with our Facilities Group, these efforts are defining the Medical School's research animal needs and plans over the next 2-3 decades. A critical component of the resulting plan (which will be presented shortly to the Executive Committee) will be construction of a 21,000 gsf Satellite Research Animal Facility (SRAF). This temporary SRAF (which has a projected life of 10-15 years) will house approximately 21,000 mouse cages and support facilities. Construction of the SRAF will commence in the spring of 2012 and will be completed in December 2012. The SRAF is critically important and in fact is essential for permitting the renovations that must be done in the current Research Animal Facility (RAF) 1 and 2. The Animal Master Plan also addresses the further utilization of other vivaria on campus that house large and small research animals. The Master Plan also addresses the need for future vivaria in the planning of future research buildings.

As a result of the City of Palo Alto "entitlements" approval, design planning will begin in early 2012 for the Foundations in Medicine 1 (FIM1) building, which will be located on the lawn just north of the CCSR (Center for Clinical Sciences Research). This 200,000 gsf research building

will face the new Stanford Hospital across Pasteur Drive and will provide a gateway and connection to the north/south and east/west connections that align the medical center and connect to the rest of the university. When completed FIM 1 will provide 640 wet bench equivalents along with faculty offices and other research support facilities. At this point the plan is to design FIM1 generically with the recognition that, given the incredible amount of hospital construction about to begin in close proximity and several other considerations, it will not be completed until 2017. However, planning is important since, in tandem with the FIMs and SIMs, continued assessment of the Edwards, Lane, Alway, and Grant complex is imperative as part of our overall facilities planning. Indeed, we are awaiting the results of a new seismic study that could impact how we handle some of these original 1959 Medical School buildings (especially the Edwards building) in the short run of the next 3-6 years. Differential plans are being put into place for the other buildings – with the expectation that the Grant Building (which faces Campus Drive to the east) is likely to remain in operation for at least another 10-15 years. Indeed, today major projects are being completed in the Alway and Lane Buildings that will house administrative offices for the Departments of Medicine and Pediatrics beginning in the spring of 2012.

Also less visible from the ground level is the completion of the Lucas Building Magnet Renovation project that offers newly improved technology for advanced imaging through the Department of Radiology. Further planning is underway for the Fairchild Science Building, which will ultimately need to be converted from a science to an administrative facility, because of its irremediable infrastructure limitations. In the interim, a number of projects to refresh or update needed improvements (some cosmetic) in the Fairchild Building are underway.

In addition to major facilities planning and capital projects, dozens of construction projects and renovation projects are underway or have been completed in virtually every medical school building. Some of these are deferred maintenance but many represent new programmatic needs and revisions – all taking time, effort and coordination. Needless to say, each year (and sometimes it seems like each day) brings new requests and needs that require attention and planning. Space is a commodity we have in short supply – and while this is a constant challenge, at least we don't suffer from the challenges many of our peers are now facing with unfilled and unfunded space at a time when research funding will be more limited and challenged. However, that is not to say that continued development of space – both renovation and construction – is not among our highest priorities and needs if we are to remain a competitive world-class institution for innovation and discovery. And, without new hospital facilities we simply could not offer the services our patients need – and deserve.

Just Outside Our Immediate Perimeter But Closely Connected

As you know from prior communications, the School of Medicine currently leases over 500,000 sq ft of space “off-campus” – from Sand Hill Road to Menlo Park to California Avenue to Arastradero. These facilities house administrative services, medical development and large and small research programs and laboratories for wet and dry research. Over the past several the School of Medicine has explored the possibility of developing a campus for technology and innovation that might consolidate a number of its programs and bring them into close proximity. We considered doing this at the Redwood City site or at the so-called Roche site, but for a variety of reasons these opportunities did not materialize.

As is often the case, sometimes failed efforts breed better opportunities, and that now appears to be unfolding at the Technology and Innovation Center being developed on Porter Drive, just

across Page Mill Road – within an easy bike commute (of course with helmets and lights) from the main campus. This evolving site will enable us to bring together “big science” programs that require more space than can be provided on campus and that can function in more of a delivery mode with less reliance on the interdisciplinary work that best takes place on campus. Of considerable importance, the Porter Avenue site abuts the VA hospital, where we have important and major research collaborations, where nearly 100 School of Medicine faculty are located and where major research developments are underway that are aligned to our shared overarching goals and programs. Porter Avenue is also near our Arastradero sites, which have also matured over the years and which are now providing a home for important neuroscience programs – just as they did for stem cell biology and regenerative medicine prior to the construction of the Lorry Lokey Building.

It is presently anticipated that Stanford will occupy seven buildings on Porter Drive – three by business units from the University and the rest by research groups and administrative units of the School of Medicine. Currently envisioned anchor programs include the Center for Genomics and Personalized Medicine, the Genome Technology Center, the Center for Early Cancer Detection, and the Stanford Center for Sleep Sciences and Medicine. Over time between 1200-1500 researchers and staff will occupy this site, thus creating a sense of community. The School of Medicine is currently in the midst of renovating several buildings:

- *3165 Porter Drive* provides 91,000 gasf; construction will commence in the summer of 2012, and occupancy is planned for the spring of 2013.
- *3155 Porter Drive* offers approximately 63,000 gasf and, in addition to research laboratories, will provide vivarium space.
- *3172 Porter Drive* will be used for administrative functions and will help consolidate programs including the Research Management Group, Human Resources, Finance, the Office of Institutional Planning, the Office of Communications and Public Affairs, Information Resources and Technology, Office of Facilities Planning and the Office of Hospital and Medical Development. The construction of this facility will begin in early 2012 and planned move-in will be in the summer of 2012.

What About Sustainability

In both new construction and renovation the School of Medicine remains committed to being a leader in sustainability and to reducing energy resources and saving money. To accomplish this we are completing a number of energy-based renovations including the Beckman Building, MSLS (Medical School Lab Surge at the Lucas Center), the MSOB (Medical School Office Building), the Hagey Pediatric Research Building, Psychiatry and others. In addition to being environmentally responsible, these facilities save water and electricity consumption and are already resulting in an annual saving of nearly \$850,000 per year.

We have had mixed results with some of our major new construction sites. For example, the Lorry Lokey Building is consuming even less energy than its design called for – which is great news. And the recycled cage project in the SIM1 vivarium saves over 9 million gallons of water annually. Unfortunately the Li Ka Shing Center for Learning and Knowledge has not fulfilled its energy model and adjustments will be necessary over the next year.

We plan to carry successful energy saving innovations to future construction and renovation projects.

What are the Operational and Capital Projects You Can Anticipate Over the Next 12 Months and Beyond?

Facilities construction and renovation are constant projects and new challenges emerge daily. Over the next year we plan to address some of the audiovisual problems in the LKSC as well its energy and HVAC problems. We will also be renewing contracts for food services and working diligently to better integrate health and safety into facilities operations. As of this report there are over 15 significant construction and facilities projects we expect to complete over the next year – and it seems safe to anticipate that others will be added to this list. Each provokes the important questions about the adequacy of current and future space, how effectively we are using what we have and planning what we need. Throughout, our planning of ongoing and future efforts will require close collaboration with our hospital partners at SHC and LPCH since the simple coordination of facilities projects will be an amazing challenge in its own right.

We also need to better plan facilities to house clinical faculty – which is rapidly becoming a rate-limiting step in our ability to recruit additional faculty. Clearly this will need to be a very high priority, and we have concurrence that joint planning on this issue will begin in earnest in the early part of 2012. In addition to space for clinical programs and faculty, we constantly need to refresh our views about the right balance of research space and how changes in science alter the mix of wet and dry space along with space for computers and technology. Of course, doing our best to match capital needs with affordable space will be critical during the next decade, when the funding for research will be more challenging and the pressures on clinical programs – including the balance between inpatient and ambulatory programs – ever more significant.

We have made a lot of progress over the past decade. Some of our accomplishments can be viewed as transformative. But as you will hopefully conclude from this report, transformation is a constant work in progress – and much remains to be done!

The Office of Communication & Public Affairs Has a New Website

The Office of Communication & Public Affairs (OCPA) released a new version of its website earlier this month to make itself even more available to the media and members of the Stanford community. To see it, please visit: <http://mednews.stanford.edu/>.

The new site highlights the services that OCPA provides to faculty, students and staff; makes it easier for members of the media to connect with OCPA staff and medical school experts, and showcases the diverse content the group produces. The new site also features biographies and contact details for OCPA employees, as well as contact lists that can be shared and customized. The site was developed in partnership with the Office of Information Resources & Technology.

The Fall Issue of Stanford Medicine Focuses on Cancer

The Fall 2011 issue of *Stanford Magazine*, a special report on cancer, paints a very mixed picture of where we are in the so-called “war on cancer.” The lead story goes so far as to say that America stands on the verge of squandering its hard-won ammunition in this “war.” While data and insights pour in as never before, the efforts to prevent, treat and cure cancer face daunting obstacles. Prime among them: a dysfunctional cancer clinical-trial system, disastrous drug shortages and a health-care system unable to deliver cancer care at an affordable price.

Decades of investment and innovation have pushed the understanding of cancer far beyond what was known when President Nixon declared the “war” in 1971. Huge investments of time, intellect and dollars have worked miracles for some types of cancer, but obviously, not all. And while leaps in understanding of cancer biology have become nearly commonplace over the past few decades, resulting in a strong base of science to build on, this pace of discovery can’t be taken for granted. Given the economic downturn and national debt burden, prolific spending on research is unlikely, no matter how fruitful its promise.

The issue includes an article entitled “Cancer’s next stage,” which describes challenges and solutions in cancer research and care at this precarious time. It’s time to shake things up, said many cancer experts. In fact, Pulitzer-winning author and oncologist Siddhartha Mukherjee, MD, (*The Emperor of All Maladies*) suggested we would be wise to do away with the cancer war imagery altogether. As he said in this issue’s Q&A: “I think we need to re-create narratives to understand what is happening. Harold Varmus [director of the National Cancer Institute] said to me, ‘Wars are things we win and lose, but solving cancer is like solving a jigsaw puzzle. And you don’t win or lose a jigsaw puzzle; you solve it or you don’t solve it.’”

The magazine, including web-only features, is available online at <http://stanmed.stanford.edu>. Print copies are being sent to subscribers. Others can request a copy at (650) 736-0297 or medmag@stanford.edu. I highly recommend it to you. And congratulations to the Office of Communication & Public Affairs for another outstanding issue of *Stanford Medicine*.

Memorial Service Celebrates the Remarkable Accomplishments of Dr. Gary M. Glazer

On Saturday, December 3rd, the Department of Radiology and the Glazer family hosted a Memorial Service to honor and celebrate the life and accomplishments of Dr. Gary Glazer, who served as Chair of the Department of Radiology from 1989-2011 and who served as the Emma Pfeffer Merner Professor in the Medical Sciences. Dr. Glazer died on October 17, 2011 following an eleven-year battle with cancer. Dr. Norbert Pelc served as the Master of Ceremonies for the service at the CEMEX Auditorium. Dr. Glazer’s exceptional contributions, from medical student to trainee, faculty member, department chair and internationally renowned physician-scientist and leader, were recounted with respect and deep caring by longstanding colleagues and trainees. Dr. Glazer’s impact on the field of radiology, his transformation of Stanford’s Department of Radiology and the community of excellence he created will endure for many decades to come. While his memory will be carried by family, friends and colleagues throughout the world, his impact on education and teaching will be memorialized at Stanford by the naming of the Gary M. Glazer MD Radiology Learning Center.

Upcoming Events

2012 Katharine D. McCormick Distinguished Lecture: Dr. Christiane Nüsslein-Volhard,
Nobel Laureate

Tuesday, January 24

4-5 pm followed by reception

Li Ka Shing Center for Learning and Knowledge (LKSC Bldg.-Berg Hall)

On behalf of the McCormick Lectureship Committee, we are delighted to announce that Dr. Christiane Nüsslein-Volhard, Nobel laureate and Director of the Max Planck Institute for Developmental Biology in Tübingen, Germany will present the 2012 McCormick Lecture. The title of her presentation will be, "The Development of Color Patterns in Fishes: Towards an Understanding of the Evolution of Beauty."

Please plan to join us for this distinguished lecture on January 24, 2012 and a reception afterwards. To register for the lecture, please click on this link: <https://www.onlineregistrationcenter.com/register.asp?m=275&c=14> If you have any questions, contact Lydia Espinosa at lydiae@stanford.edu or 650-724-0239.

The McCormick Lectureship:

Katharine Dexter McCormick, an early feminist, devoted much of her long life to the welfare of women. On her death at age 92, she left a large bequest to the Stanford University School of Medicine with the hope that it would be used "in aid of women students attending the School of Medicine and more generally for the encouragement and assistance of women in pursuing the study of medicine, in teaching medicine and engaging in medical research." The McCormick Lectureship is one of the ways of fulfilling the wishes of Dr. McCormick.

Cultural Considerations in Population Health Research and Clinical Practice Series
Interactive Workshop Series over Dinner for Stanford School of Medicine Faculty

Session 1: "Health Disparities and Implications for Patient Care and Research"
Thursday, January 5
5:30 pm – 8:00 pm
Always Building, Room M112

Dr. Clarence Braddock will kick off the Cultural Considerations in Population Health Research and Clinical Practice Series by providing an introduction to health disparities and discussing its implications for patient care and research through this interactive workshop.

Junior faculty are strongly encouraged to attend. Dinner will be provided. Due to limited seating, please kindly RSVP for the January 5 session by **Thursday, December 15, 2011** at:
<https://www.onlineregistrationcenter.com/register.asp?m=275&c=13>

Upcoming Sessions: Cultural Considerations in Population Health Research and Clinical Practice Series

Session 2: "Cultural Humility and the Space Between Us: The Case of the Police Officer and the Professor"
Jan Murray-Garcia, MD, MPH
Assistant Adjunct Professor, UC Davis School of Nursing
Thursday, February 2, 2012 | 5:30 - 8 PM | Always, Room M112

Session 3: "It Is Not What You Say, It Is What They Hear: Cross Cultural Communication and Building Trusting Relationships"

VJ Periyakoil, MD

Clinical Associate Professor of Medicine, Stanford University; and Director, Palliative Care Education and Training

Thursday, March 1, 2012 | 5:30 - 8 PM | Alway, Room M112

Session 4: "Cultural Considerations in Minority and Low Income Recruitment into Clinical Trials"

LaVera Crawley, MD, MPH

Assistant Professor of Pediatrics, Stanford University

Thursday, April 5, 2012 | 5:30 - 8 PM | Room TBD

For more information, please contact Rhonda McClinton-Brown (rhondam@stanford.edu) or Diana Austria (daustria@stanford.edu).

The Cultural Considerations in Population Health Research and Clinical Practice Series *is* sponsored by the Office of Community Health and the Office of Diversity and Leadership and funded by the Stanford Clinical & Translational Science Award (CTSA).

Awards and Honors

- **Dr. Ken Cox**, Senior Associate Dean for Clinical Affairs/Pediatric and Obstetrics, Professor of Pediatrics, Director of the Center for Transplantation, and Chief of Pediatric Gastroenterology and Nutrition at Lucile Packard Children's Hospital, will be the recipient of the American Liver Foundation's "Salute to Excellence" Award.
- **Dr. Stuart Goodman**, the Robert L. and Mary Ellenburg Professor, has been elected to the College of Fellows of the American Institute for Medical and Biological Engineering (AIMBE).
- **The VA Palo Alto Health Care System** is the recipient of the Carey Award for its excellent performance in patient care, patient satisfaction, quality, safety and business practices.

The Stanford Medical Youth Science Program (SMYSP) was named as a 2011 recipient of the Presidential Award for Excellence in Science, Mathematics and Engineering Mentoring. The award, the highest honor bestowed by the U.S. government for mentoring in these fields, carries a \$25,000 prize from the National Science Foundation to help further SMYSP's efforts. **Marilyn Winkleby, PhD**, Professor of Medicine at the Stanford Prevention Research Center, founded SMYSP in 1988 with two pre-med students, and has since served as its faculty director. Each year, 10 Stanford undergraduates oversee the summer residential program, which focuses on low income and under represented minority high school students from Northern and Central California.

Appointments and Promotions

Catherine Blish has been appointed to Clinical Associate Professor of Medicine, effective 12/1/2011

Paul R. David has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 10/1/2011

Luis De Lecea has been promoted to Professor of Psychiatry and Behavioral Sciences, effective 12/1/2011

Balaji Govindaswami has been appointed to Clinical Professor (Affiliated) of Pediatrics, 12/1/2011

Liliana K. Hamlett has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2011

Michael Hirschklau has been reappointed as Clinical Associate Professor (Affiliated) of Pediatrics, effective 9/1/2009

Aaron Ilano has been promoted to Clinical Associate Professor (Affiliated) of Surgery, effective 9/1/2011

Priya Jegatheesan has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 12/1/2011

Susy Shu-Hsin Jeng has been appointed to Clinical Assistant Professor of Neurology and Neurological Sciences, effective 1/1/2012

Yeuen Kim has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 11/1/2011

Andrea Kwan has been appointed to Clinical Associate Professor of Genetics and of Pediatrics, effective 10/1/2011

Haydn H. Leung has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 10/1/2011

Cathleen M. Ligman has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 9/1/2011

Ann Lindsay has been appointed to Clinical Professor of Medicine, effective 1/1/2012

William Davidson Ogden has been reappointed as Clinical Assistant Professor of Cardiothoracic Surgery, effective 12/1/2011

Kendra Peterson has been appointed to Clinical Associate Professor (Affiliated) of Neurology and Neurological Sciences, effective 11/1/2011

Marlyanne M. Pol-Rodriguez has been appointed to Clinical Assistant Professor of Dermatology, effective 12/1/2011

Peter Pompei has been appointed to Clinical Professor of Medicine, effective 12/1/2011

Edward Rustamzadeh has been promoted to Clinical Associate Professor of Neurosurgery, effective 1/1/2012

Kenneth Sakamoto has been appointed to Clinical Associate Professor of Medicine, effective 12/1/2011

Allison T. Siebern has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 12/1/2011

Mark Thanassi has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 10/1/2011

Philip S. Tsao has been reappointed to Professor (Research) of Medicine, effective 12/1/2011

Eva Weinlander has been reappointed as Clinical Associate Professor of Medicine, effective 9/1/2011

Dean's Newsletter

January 9, 2012

2012: What Comes Next

Even before joining the Stanford community on April 2, 2001, I was mindful of the reality that the future success of an academic medical center like Stanford could be dramatically altered by a varying constellation of internal and external forces and events. I knew that some of these were controllable, while others were less amenable to modulation or alteration. This reality was all too evident in the consequences of the merger and de-merger with UCSF that antedated my arrival and was reflected in the outlines of my strategic thinking at the time, which I shared in my first Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/04_02_01.html). It also helped define the foundations of our Strategic Plan, "*Translating Discoveries*," which was first formulated during our first Strategic Planning Leadership Retreat on February 8-10, 2002 (see: http://deansnewsletter.stanford.edu/archive/02_04_02.html and http://deansnewsletter.stanford.edu/archive/02_18_02.html#3) and which has been continuously refined over the now nearly past 11 years. It has also helped define many of the initiatives we have undertaken during this time.

Throughout this time I have tried to keep in mind that whatever changes we made should have a view and purpose toward shaping the future and that, ideally, they should stand the test of time. Of course universities – and perhaps especially academic medical centers – must be prepared to change and adapt, but it is important that those changes stay true to fundamental underlying principles and that the directional compass optimize continued success over time. Institutions like Stanford become great because of the quality, depth and excellence of the human capital that

resides in our students, faculty and staff. And while the independent pursuits of uniquely talented individuals create unforeseen opportunities, it is also vital to create alignments and interactions around shared goals and objectives so that, over time, the whole constantly grows to become greater than the sum of its parts. In many ways, “what come next” is ideally informed by what currently exists and whether it is matched to immediate and future challenges and opportunities. Change is always important to bring vibrancy and renewal to organizations (and individuals), but it is also best framed in the context of the history and fundamental values that have defined an institution. Of course these can be changed – but such fundamental change should be done with deliberation and not inadvertently or reactively.

In my initial encounters with Stanford Medicine in 2000, when I was asked to consider becoming dean, the uniqueness of this institution was immediately apparent. In many ways, appreciation of that uniqueness has grown with each passing day and year since it adds to our great strengths as well as not insignificant challenges. For example, it is common wisdom that compared to peer institutions we are among the smallest – in the number of faculty in our ranks, the number of students and trainees we educate and train, and the size and scope of our clinical programs and related resources. “Small” is not a term that many individuals would apply to Stanford – largely because the magnitude of our impact is often so great. But “being small” is very much part of the Stanford culture, not only at the School of Medicine, but also at all of the seven schools that comprise our University.

Equally if not even more important at Stanford is a culture that values innovation, discovery, research, entrepreneurship and exploring the intersections and boundaries of interdisciplinary and transdisciplinary research and education. Indeed, becoming increasingly integrated into the university – with interactive educational and research programs with colleagues in engineering, arts and humanities, environmental and social and physical sciences, as well as business, law and education – makes Stanford Medicine stand out from virtually every other academic medical center. More often, medical schools and teaching hospitals are physically separated from each other and nearly always remote from their parent universities. That is not the case at Stanford, where physical proximity and interaction afford easily accessible opportunities for collaboration and the sharing of ideas and programs. While much of this is fostered by the “Brownian movement” that occurs when students, postdocs, faculty and staff “run into” each other, it has also been facilitated by the interdisciplinary programs that have evolved over the past decade across the university to forge new opportunities for interaction. Some of these emerged through the University’s Stanford Challenge campaign, while others were created and developed through our strategic plan.

Interdisciplinary Education and Research

Among the most notable university-wide interdisciplinary initiatives over the past decade have been Bio-X (<http://biox.stanford.edu/index.html>), the joint School of Medicine and School of Engineering Department of Bioengineering (<http://bioengineering.stanford.edu/>), the Initiative on Human Health (<http://giving.stanford.edu/get/layout/tsc/HumanHealth>), the Woods Institute for the Environment (<http://woods.stanford.edu/>), and the Freeman-Spogli Institute for International Affairs (<http://fsi.stanford.edu/>). Each has created new bridges between schools and people. These efforts build on the unique partnerships forged by faculty and students and add to numerous other examples of joint and shared programs for research and education.

Stanford Institutes of Medicine and Strategic Centers

In tandem with these efforts the School of Medicine has evolved its strategic plan (see: <http://medstrategicplan.stanford.edu/>) to develop five interdisciplinary Stanford Institutes of Medicine along with three Strategic Centers to foster collaboration, interaction and innovation education, research and patient care. The Stanford Institutes of Medicine include the Stanford Cancer Institute (<http://giving.stanford.edu/get/layout/tsc/HumanHealth>), the Stanford Institute for Stem Cell Biology and Regenerative Medicine (<http://stemcell.stanford.edu/>), the Stanford Cardiovascular Institute (<http://cvi.stanford.edu/>), the Stanford Institute for Neuro-Innovation and Translational Neurosciences (<http://neuroscience.stanford.edu/>), and the Stanford Institute for Immunity, Transplantation and Infection (<http://iti.stanford.edu/>). Faculty in the Stanford Institutes of Medicine come from basic and clinical science departments in the medical school as well as across the university and create new communities of faculty and trainees to promote innovation and discovery – as well as new models for education and training. The operating principles governing the Stanford Institutes of Medicine were codified in a “white paper” in December 2006 (<http://med.stanford.edu/institutes/guidelines.pdf>) that provides an important foundation for organization. Over the past two years the clinical cancer, cardiovascular and neuroscience programs have been integrated into the Institutes of Medicine as part of an integrated strategic planning effort between Stanford Hospital & Clinics and the School of Medicine.

In tandem with the Stanford Institutes of Medicine, several crosscutting “strategic” centers have been established to foster interaction among departments, institutes and others across the medical school and medical center. These include the Stanford Center for Clinical Informatics (<https://clinicalinformatics.stanford.edu/>) the Center for Biomedical Imaging (<http://cbis.stanford.edu/>) and the Center for Genomics and Personalized Medicine (<http://stanfordhospital.org/newsEvents/newsReleases/2011/personalized-medicine.html>). Importantly, the medical school and its departments host numerous other centers that foster, promote and support both broad and more defined missions and programs in research, education and patient care and that share in common the goal of enhancing our unique academic environment.

Clinical and Translational Research and Medicine

While excellence in basic science remains the foundation and a unique strength of Stanford Medicine, considerable effort and investment have been made in enhancing programs in clinical and translational science. Of note has been the success of the Stanford Center for Clinical and Translational Education and Research under the banner of Spectrum (<http://spectrum.stanford.edu/>). In addition to its broad range of programs to support and educate students and faculty in clinical research, Spectrum also helps align innovative programs like SPARK (<http://sparkmed.stanford.edu/>) and BioDesign (<http://biodesign.stanford.edu/bdn/index.jsp>). These programs are rapidly becoming models of excellence in clinical and translational innovation, discovery and development for new drugs, biologics and devices – and are extending Stanford’s collaboration locally and globally. A burgeoning program to foster innovation in global health is also rapidly evolving through the Center for Innovation in Global Health (<http://globalhealth.stanford.edu/>).

In addition, our focus on population health sciences – ranging from biostatistics and epidemiology to health policy and innovations in healthcare delivery – has been undergoing significant development and has been receiving increased discussion among faculty leaders (http://deansnewsletter.stanford.edu/archive/05_23_11.html#1). This initiative will be further

discussed at the Annual Strategic Planning Leadership Retreat that will take place on January 20-21, 2012.

Education

The spirit of interdisciplinary interaction has been a tradition in education at Stanford and has been very much “center stage” in our strategic planning. Since the major curriculum changes that were introduced in 2003, continued evolution has occurred. For example, medical students now have the ability to pursue joint degree programs in every school at Stanford. Training outstanding physicians and leaders who become excellent clinicians as well as physician scholars and physician scientists is becoming a strong tradition at Stanford Medicine. Research, including a “Scholarly Concentration,” is a centerpiece of our MD curriculum (<http://med.stanford.edu/md/>) and is coupled with other major innovations that are currently being developed (http://deansnewsletter.stanford.edu/archive/09_13_10.html#1). As we train leaders we are also mindful of educating medical students about excellence in clinical medicine and humanism, and we have recently introduced unique programs such as Educators For Care (<http://med.stanford.edu/e4c/>).

We also have a long tradition of excellence in MD/PhD education through the Medical Science Training Program, which has recently been extremely favorably reviewed and which will help us further expand the number of MD/PhD students we will admit to Stanford (http://med.stanford.edu/combined_degree/). Although the PhD curriculum has not undergone major revision for some time, considerable work on a proposed new program for graduate education has been underway since our 2010 Think Tank on Thinking About Graduate Education and our 2011 Leadership Retreat (http://deansnewsletter.stanford.edu/archive/09_13_10.html#1) and will be among the topics for discussion at the Annual Strategic Planning Leadership Retreat this year.

Patient Care

In addition to our missions in research and education, patient care has been the focus of considerable attention over the past many years and is clearly the beneficiary of our missions in education and research. Without doubt we have witnessed considerable uncertainty and concern in recent years about major changes likely to unfold through healthcare reform and specifically the Affordable Care Act (ACA) of 2010. I have written frequently about this topic in prior Newsletters (http://deansnewsletter.stanford.edu/archive/03_07_11.html). The debate about healthcare has been dominated by political agendas and often loses its focus and moral compass. And we are all witnessing the political – and soon the judicial – debates about the future of the ACA. There is no question that the current healthcare system is not financially sustainable or even really functional, and the need for change is essential and urgent. While many approach this issue with dread and even despair, I think we have the opportunity to emerge as national leaders by developing novel and innovative approaches to healthcare delivery with a heightened emphasis on sustaining the health and wellbeing of the communities we serve, regionally and beyond.

With that in mind we have been working diligently with our colleagues at Stanford Hospital & Clinics (SHC) and at the Lucile Packard Children’s Hospital (LPCH) to plan strategically for a future that envisions major changes in how and where clinical care is delivered (http://deansnewsletter.stanford.edu/archive/04_05_11.html#1). While the models for adult and pediatric care differ somewhat, both are grounded in the fundamental question of how we can

transform Stanford University Medical Center to be the national model for leading edge innovation and coordinated complex care as well as outstanding primary and secondary care. We need to transform how, where and when care is delivered and how disease management can be complemented with disease prevention and health improvement.

Integrated planning involving the School of Medicine and SHC is actively underway to achieve these goals in cardiovascular health, cancer and neuroscience. Each of these is currently an area of strength, but the planning focus is on developing new models of innovation and clinical care delivery that can further differentiate SUMC as a true model of excellence. One advantage we have in our integrated clinical planning is the alignment between the faculty and the hospital resulting from the “Funds Flow Model” that was developed between the School of Medicine and SHC in 2005 (http://deansnewsletter.stanford.edu/archive/02_22_05.html#1) and that has been complemented by a new Funds Flow Model between SoM and LPCH over the past year.

But simply providing excellent care is insufficient. Care must also be delivered with great patient satisfaction and be valued by consumers and payers, whether provided in in-patient or ambulatory settings. Major initiatives are underway at SHC and LPCH to improve the patient experience, enhance quality performance, increase efficiency and reduce expenses. Major investments continue to be made in information technology, and the electronic medical record (EMR) at SHC is among the most technologically comprehensive in the nation. Major investments are now being made for the construction of major new hospital facilities at both SHC and LPCH – indeed, this is the largest and most comprehensive facilities project in the history of the medical center, university and City of Palo Alto (<http://stanfordhospital.org/rebuild/>).

Major initiatives are also underway to develop a program in primary care through the Department of Medicine and a regional network of care through our faculty practice and the University Healthcare Alliance and the Packard Health Group. While primary care has not been a major area of focus in the past, that priority is now changed, with efforts underway to develop a significant program that will offer a range of clinical services both within the Medical Center and distributed regionally. New models of clinical care delivery for patients with chronic medical conditions are being developed – including the novel Ambulatory-ICU model (http://deansnewsletter.stanford.edu/archive/03_07_11.html#2) that will become operational in the spring of 2012. Other novel initiatives in healthcare delivery are being developed through the newly established Clinical Excellence Research Center (<http://med.stanford.edu/ism/2010/may/milstein.html>).

Faculty and Students

Without question the most important resource we have is the excellence of our faculty, students and staff. It is their uniqueness and creativity that makes Stanford the institution it is today and what it will be in the years and decades ahead. I noted above that compared to peers Stanford is small in numbers but outstanding in quality. In a number of important ways, limiting growth compels us to optimize quality and excellence in every decision we make – about students, faculty and staff. While we have a total of approximately 470 medical students (including those pursuing MD/PhD degrees) we have limited the size of each entering class to 86. A majority of medical students stay for five or more years in order to pursue research and scholarship and/or a joint degree. We also have the lowest amount of student indebtedness at graduation for MD students of any school in the country – an asset that helps students with their short and long-term

career planning. Our students all engage in some research activity and author more scientific or other publications per number of students than any school in the nation. We also have approximately 520 students pursuing PhD degrees, many in interdisciplinary programs, and a selected number in a unique Masters in Medicine Program (<http://msm.stanford.edu/>).

In addition, we have approximately 800 residents and clinical fellows at SHC and LPCH (with affiliated programs at the Palo Alto VA, Santa Clara Valley Medical Center and Kaiser) and over 1100 postdoctoral fellows in our research programs. Increasingly we are exploring ways to align education across the continuum from undergraduate education through advanced fellowship training— such as through the recently launched Stanford Society of Physician Scholars (<http://ssps.stanford.edu/>).

Currently the faculty numbers at Stanford average less than half of those at peer schools but, once again, quality per faculty is outstanding. The aggregate numbers of faculty can be illusory. Presently there are about 870 full time faculty and just over 400 clinical educator faculty. Because our size is small, we understandably fall short on metrics based on aggregate numbers (such as total NIH funding). Looked at on a per faculty basis or as a percent of faculty, the picture looks quite different. For example, Stanford Medicine ranks #1 in the nation in the amount of NIH funding per faculty member. We have more winners of NIH Pioneer Awards (a reflection of innovation) than any other school. On a percentage basis, we have more faculty who are Members of the Howard Hughes Medical Institute and a higher percentage of our faculty who have been elected to the Institute of Medicine and the National Academy of Sciences than any other school. There is no question that the impact of our faculty well exceeds sheer numbers. And many of our faculty are reasonably new to the medical school: over the past 10-11 years we have recruited over 550 of the full-time faculty and a very high proportion of our clinician-educator faculty.

In addition to their success as scholars, clinicians and educators, many of our faculty have developed as leaders in science and medicine. This has been aided by the work of our Office of Diversity and Leadership (<http://med.stanford.edu/diversity/>), which has instituted a number of important development and training programs – some of which have been done in partnership with our teaching hospital colleagues and university partners. In addition to developing leaders, considerable effort and some success has been achieved in the diversity of faculty, one of our highest continuing priorities.

Financial Resources, Planning and Challenges

The financial underpinnings of academic medical centers are complicated since they rely on multiple sources: sponsored research, clinical income, endowment, gifts, royalties (and for public institutions, state or federal funds). Most academic medical centers are highly leveraged on clinical income that is transferred from teaching hospitals to subsidize missions in education and research, both of which require institutional support. Even for “research intensive” medical schools, clinical income usually exceeds all other sources. When looked at as a single entity, many medical schools have very narrow margins, and many run deficits that are offset from clinical income. This has been the history of academic medicine for much of the second part of the 20th century through now – largely reflecting the clinical revenues and margins of most hospitals. But this is a pattern likely to change as clinical revenues become more limited and challenged and opportunities for cross-subsidization become more constrained. This is where size, balance and expectation become important – and where “right-sizing” is critical (this

activity is currently being pursued by a number of peer institutions who have, in some ways, grown beyond their supply lines).

The financial picture at Stanford reflects the mission and character of our institution – and it is one that has changed quite dramatically over the past decade. Indeed, early in the decade, our teaching hospitals had negative financial margins, and the unrestricted resources in the medical school were limited in amount and sustainability. That picture has changed considerably for the better. In the aggregate, Stanford University Medical Center in 2011-2012 is quite healthy. Both teaching hospitals are profitable. And since 2003, the School of Medicine has had an average positive contribution to its consolidated budget of \$29 million per year, with \$49 million in FY11. This is based on an annual revenue base that has increased to nearly \$1.4 billion. Unlike the situation at our peer institutions, sponsored research grants and contracts comprise our largest single source of revenue (38%), while clinical income is 32% (up from 31% in FY10). Importantly, research activity as well as clinical activity has continued to increase – despite the changes in federal funding for research and the pressures of healthcare expenditures. In fact total research expenditure activity increased by 13.8% (compared to 18.1% in FY10) and non-ARRA research expenditures increased by 9.7% in FY11 (compared to 7.7% in FY10). While there are a number of factors contributing to these exceptional increases (compared to most peers) the most important is the quality of grant submissions – which is a reflection of the talent, creativity and innovation of our faculty and their colleagues.

Equally important, our clinical programs have continued to grow and excel over the years – again reflecting the quality of faculty and trainees, many of whom have been recruited during the past decade. Our success also reflects our integration and alignment with SHC and LPCH, including, as noted above, the “funds flow” agreements with each teaching hospital. Based on these and other factors, including overall clinical productivity, our six year CAGR (compound annual growth rate) in net clinical operating surplus has increased by 16% from 2005 to 2011. Significantly, the clinical departments “clinical surpluses” increased from FY10 to FY11 by an average of 130%, and all of the departments had clinical surpluses.

Although endowment constituted only 8% of the medical schools consolidated revenues in FY11, it is important to note that as of August 31, 2011 the market value of the School of Medicine endowment was \$2.156 billion. This is still slightly less than the \$2.2 billion level in August 2008 prior to the financial meltdown, but it is evidence of significant recovery – which will exceed the projected date (2015-6) of recovery that we had forecast. This result reflects both excellent investment returns as well as significant addition to principle. While the level of endowment and the amount of expendable reserves (\$572.8 million as of August 31, 2011) are notable, it is also important to underscore that the vast majority – in some cases over 85% - of these funds are restricted to specific uses that cannot be changed by faculty, department chairs or the dean’s office. Nonetheless, the endowment plus reserves provides a cushion of security against uncertain times – especially when coupled with increased revenue from sponsored research and clinical income.

In the aggregate these financial data demonstrate considerable financial success for the School of Medicine – especially when compared to the situation a decade ago. But they need to be viewed in the context of what is coming next – specifically, a reduction in federal (and possibly state [aka CIRM, the California Institute for Regenerative Medicine]) support for research and the likely decreases in healthcare revenues as a consequence of reform and the ACA. While these

changes reflect national agendas – and continued economic pressure – it is still uncertain how they will impact SUMC. Of course we must plan for negative impacts – but we must also plan for programs and initiatives that will foster future success.

Physical Resources and Planning

The past decade has seen major changes on our physical landscape and capital resources, and this coming decade will continue this trend. In the December 12, 2011 Newsletter I summarized the major facilities activities that will impact SUMC – both on and immediately off-campus (http://deansnewsletter.stanford.edu/archive/12_12_11.html#5). Among these, the size, scope and complexity of the hospital renewal projects at SHC, LPH and the Hoover site are daunting by any measure and are already having an impact. The next 5 years will witness incredible construction accomplishments and challenges that will affect all of us. But by the end of this decade, SUMC will be truly transformed (even though further medical school construction projects will continue for at least another 10-15 years after that before the master plan is complete). While there is no question that our human capital is and will remain our most important asset, it is also clear that the facilities transformation will harmonize our physical and intellectual resources and provide opportunities that in some cases remains untold – but very exciting.

What's Happening Around Us

As noted at the outset of this “essay,” external events can absolutely impact whatever plans we put in place – and we need to anticipate as many of them as we can. Some of these are known now but were unforeseen five years ago (by most people). The most important of these was the 2008 economic downturn that has affected the US, local regions (including California) and the global economy. While we are fortunate to have a strong financial portfolio today, we need to continue to plan conservatively and creatively to sustain and enhance the resources to support our students, faculty, programs and initiatives so we can continue to serve them and the patients who come to SUMC to manage health and disease. To that regard, it is appropriate to anticipate that funding for research from the NIH and other federal agencies will be flat (or reduced) for at least the next several years. While we have been successful in winning grants today, much can change if the NIH alters policies or procedures (such as capping the number of grants per investigator, the size of grants or total allocation to an investigator). The recent announcement that the NIH salary cap will be reduced to Executive Level II for all new grants after December 24, 2011 will certainly have an impact on faculty. Changes that NIH could make on support for graduate students could also affect our programs.

Beyond federal support for research, we need to be cognizant that funding from the California Institute for Regenerative Medicine (CIRM) has had a major favorable impact on Stanford faculty (and facilities). Proposition 71, which launched CIRM, will expire in a few years, and if it is not renewed by the citizens of California, the state's investment in stem cell research and regenerative medicine will be greatly diminished – as will research opportunities for our faculty in these and related fields.

We have been fortunate to benefit from patent royalty income, but one of the largest of those patents will end in 2016. And while Stanford faculty remain incredibly successful in generating new intellectual property, the reality is that most patents pay small amounts and it is unpredictable as to when a discovery or invention will have a major financial impact (most often these are platform technologies).

Also predictable is the almost certain downward revenues for patient care – to both hospitals and physicians. We all know that this is important for the health of our nation, since the current national expenditures on healthcare in the US are unsustainable for a system that is at its core misaligned and often dysfunctional. The Affordable Care Act (ACA) is the first federal legislation to address healthcare reform, but it is far from perfect and its very outcome is now subject to political forces and judicial reviews. This next year will determine whether challenges to the legality of certain elements of the ACA will be accepted or rejected by appeals to the US Supreme Court. And the results of the 2012 US Presidential elections, now underway, will have further positive or negative impact. No matter what, changes are necessary and revenues will almost certainly decline. An impact on Medicare (and to Graduate Medical Education support) seemed highly likely just a couple of months ago and will certainly be a major issue in the next year as the debate about sequestration and deficit reduction heat up again. The bottom line is that the current fee-for-service model of healthcare payments seems destined to change (which is a good thing), but what will replace it is still uncertain. Even programs that seemed likely in 2010-11 (such as “Accountable Care Organizations”) have had stormy courses to acceptance and will like morph into other forms for bundled payments.

While these are among the “known” forces that will affect us, we need to think about (and if possible anticipate) the “unknown” ones at this time – since it is evident that what seemed unlikely just years ago (the global economic financial crisis) can indeed happen – and immediately disrupt plans and resources that seemed evident or expected.

What Comes Next

A predictable change in 2013 will be my transition as dean. I fully expect leadership by a new dean that will bring Stanford Medicine to even greater success and heights. I won’t forecast the agenda for a future leader and governance but will posit that at least some issues are likely to continue to command attention, energy, creativity and leadership. Here are just a few:

- The need for continued vision and leadership to define, steward and oversee the success and integrity of the medical school and medical center. Foremost will be efforts to evolve plans to protect, secure – and enhance – the research mission of Stanford Medicine. Of course a significant part of this will depend on the creativity and success of faculty in achieving competitive grants, and finding ways to bolster their support with endowed faculty scholar awards and endowed professorships will continue to be important and even essential.

In the healthcare arena, regardless of the national debate, SUMC must evolve as a model of excellence. This will require continued and rigorous efforts to balance state-of-the art and innovative approaches with the care of patients with complex medical conditions. It also will require development of a broader delivery system along with novel approaches to healthcare delivery. Sustaining outstanding metrics in quality, safety and the patient experience in a cost-effective manner will be critical. Achieving these goals will require exceptional interaction with hospital leaders.

- Continued focus on our unique mission in the education of medical and graduate students is essential to our core mission. A key challenge will be to successfully capture the

incredible opportunities now emerging in technology and simulation to supplement and complement our teaching. Another will be to extend the educational continuum across the lifespan (from undergraduate to continuing education), with continued refinement on educating and training the future leaders and transformers of science and medicine even more effectively. This is equally important in graduate education, where creative planning for programs that prepare graduates for a range of career paths and opportunities is increasingly important.

- As noted abundantly above, finding new and better ways to support and enhance the career paths of faculty and students remains our most important investment. In tandem with this objective is continuing to diversify our community and create career paths that are more balanced, flexible, attractive and fulfilling than heretofore. Stanford Medicine should be the leader in such efforts and programs.
- The continued challenges for making our physical environment and facilities as outstanding as our “human capital” will continue to be a major opportunity over the next decade. There are many hurdles to be overcome in achieving our aims in these efforts, but if they have the outcome we hope and expect, they will further Stanford transformation beyond even our current imagination.
- To enable our dreams and visions to become reality, a major goal must be the realization of the campaign for SUMC that raises the resources to support our missions, people and facilities. Fundamental to success will be the crafting of big visions that shape the opportunities that will engage our community at Stanford – along with those who will help to support it.

I wish you all a Happy New Year – since without question this is what I hope does come next.

Awards and Honors

- **Dr. Nick Blevins** was appointed the inaugural chair holder of the Larry and Sharon Malcolmson Professorship at a lovely investiture event on Monday evening December 12th. Dr. Blevins’ family, along with colleagues and friends of the Malcolmsons and faculty and friends of the Department of Otolaryngology: Head & Neck Surgery joined together in a celebratory evening. The generosity of Larry and Sharon Malcolmson in establishing this new professorship is deeply appreciated.
- **Dr. Ken Cox** will be honored by the American Liver Foundation at a Salute to Excellence Awards Gala in San Francisco in March. The dinner and reception honors those who have made an outstanding contribution to biotechnology and medical innovation.
- **Dr. PJ Utz** is one of nine recipients to receive a 2011 Clinical Research Experiences for High School Students (CREHSS) grant from the Doris Duke Charitable Foundation for his Stanford Institute of Medical Research Program (SIMR).

Congratulations to all!

Appointments and Promotions

Ingrid Aalami has been reappointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2011

Rodney Altman has been reappointed to Clinical Assistant Professor of Surgery, effective 9/1/2011

Marion Buckwalter has been reappointed to Assistant Professor of Neurology and Neurological Sciences and of Neurosurgery at the Stanford University Medical Center, effective 2/1/2012

Andrea Cervenka has been reinstated and reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 11/1/2010

Bertha Chen has been promoted to Professor of Obstetrics and Gynecology and, by courtesy, of Urology, at the Stanford University Medical Center, effective 1/1/2012

Edison Chiu has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2011

Diane E. Craig has been reappointed to Clinical Associate Professor (Affiliated) of Medicine, effective 9/1/2011

Jenny Chin-Lin Dai Biller has been promoted to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 1/1/2012

Thomas M. Dailey has been reappointed to Clinical Associate Professor (Affiliated) of Medicine, effective 3/23/2011

Subashini Daniel has been promoted to Clinical Assistant Professor of Cardiothoracic Surgery, effective 1/1/2012

Jennifer Derenne has been appointed to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 1/3/2012

Anthony Doufas has been reappointed to Associate Professor of Anesthesia at the Stanford University Medical Center, effective 12/1/2011

Michael Edwards has been reappointed to Professor of Neurosurgery at the Stanford University Medical Center and, by courtesy, of Pediatrics, effective 12/1/2011

Barbara T. Egan has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 12/1/2011

Nancy Fischbein has been promoted to Professor of Radiology and, by courtesy, of Otolaryngology – Head and Neck Surgery, Neurology, and Neurosurgery, at the Stanford University Medical Center, effective 12/1/2011

Rosario Garcia has been promoted to Clinical Assistant Professor of Anesthesia, effective 1/1/2012

Louis P. Halamek has been promoted to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital and, by courtesy, of Obstetrics and Gynecology, effective 12/1/2011

Howard J. Harvin has been promoted to Clinical Assistant Professor of Radiology, effective 11/1/2011

Samina Iqbal has been promoted to Clinical Associate Professor (Affiliated) of Medicine, effective 1/1/2012

Ethan Jackson has been promoted to Clinical Associate Professor of Anesthesia, effective 2/1/2012

Safwan Jaradeh has been appointed to Professor of Neurology at the Stanford University Medical Center, effective 12/1/2011

Kiran Khush has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 12/1/2011

Audrey Kuang has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 12/1/2011

Craig Levin has been reappointed to Professor (Research) of Radiology, effective 1/1/2012

Glen Lutchman has been reappointed to Clinical Assistant Professor of Medicine, effective 9/1/2011

David M. Lyons has been promoted to Professor (Research) of Psychiatry and Behavioral Sciences, effective 1/1/2012

Daryl A. Oakes has been reappointed to Clinical Assistant Professor of Anesthesia, effective 11/1/2011

Cholawat Pacharinsak has been appointed to Assistant Professor of Comparative Medicine at the Stanford University Medical Center, effective 12/1/2011

Susan C. Price has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 12/1/2011

Eugene Yousik Roh has been promoted to Clinical Assistant Professor of Orthopaedic Surgery, effective 1/1/2012

Alan Schroeder has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 1/1/2012

Robert Shafer has been promoted to Professor (Research) of Medicine, effective 1/1/2012

Shamita Shah has been reappointed to Clinical Assistant Professor of Medicine, effective 9/1/2011

Veronika Sharp has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 1/1/2012

Dongli Song has been appointed to Clinical Associate Professor (Affiliated) of Pediatrics, effective 12/1/2011

Barbara Sourkes has been promoted to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital and, by courtesy, of Psychiatry and Behavioral Sciences, effective 12/1/2011

Brent Tan has been reappointed to Clinical Assistant Professor of Pathology, effective 12/1/2011

Jennifer A. Tremmel has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 12/1/2011

Jeffrey Tseng has been appointed to Clinical Assistant Professor (Affiliated) of Radiology, effective 10/1/2011

Lindsey G.C. Vokach-Brodsky has been reappointed to Clinical Associate Professor of Anesthesia, effective 10/16/2011

Jennifer W. Wagner has been promoted to Clinical Assistant Professor of Anesthesia, effective 1/1/2012

Derrick Wan has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 12/1/2011

Michelle Young has been reappointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2011

The Dean's Newsletter: January 30, 2012

Appointment of Dr. Robert A. Harrington as the Chair of the Department of Medicine

I am extremely pleased to announce that Dr. Robert A. Harrington will join Stanford in July 2012 as the new Chair of the Department of Medicine. Dr. Harrington is currently Director of the Duke Clinical Research Institute (DCRI), a position he has held since 2006. He is also the Richard S. Stack MD Distinguished Professor at Duke University School of Medicine, where he

is also a practicing cardiologist. Accompanying Dr. Harrington to Stanford will be his spouse Rhonda Larsen, who holds BS, PA and MHS degrees from Duke and who is Consultant for Clinical Research and Training at DCRI as well as Founder of Site Research Solutions.

The selection of Dr. Harrington as Stanford Chair of Medicine is the result of a search committee led by Dr. Steve Galli, Mary Hewitt Lovelace Professor and Chair of the Department of Pathology. The Committee began its work in the fall of 2010 and spent hundreds of hours of efforts reviewing the status and needs of the Department of Medicine as well as the ideal characteristics of the future chair. Potential candidates were determined from consultation with leaders at Stanford and across the nation. The work of the Search Committee was wonderfully facilitated and enabled by the dedicated efforts of Ms. Kendra Baldwin along with her colleagues from the Office of Institutional Planning.

I want to thank each of the members of the Search Committee for their personal and collective contributions. They are:

- Douglas Blaney, MD, Professor, Department of Medicine and Medical Director, Stanford Cancer Center
- Thomas Burdon, MD, Professor, Department of Cardiothoracic Surgery
- Mark Davis, PhD, Professor, Department of Microbiology and Immunology and Director, Institute for Immunity, Transplantation and Infection
- Nancy Fischbein, MD, Professor, Department of Radiology
- Sabine Girod, MD, PhD, Associate Professor, Department of Surgery
- Richard Hoppe, MD, Professor, Department of Radiation Oncology
- Mark Krasnow, MD, PhD, Professor and Chair, Department of Biochemistry
- Lawrence Leung, MD, Professor, Department of Medicine and Chief-of-Staff, Palo Alto VA
- Michael Longaker, MD, Professor, Department of Surgery and Co-Director, Stanford Institute for Stem Cell Biology and Regenerative Medicine
- Frank Longo, MD, PhD, Professor and Chair, Department of Neurology & Neurological Sciences
- Bonnie Maldonado, MD, Professor, and Chief of Infectious Diseases, Department of Pediatrics
- William Maloney, MD, Professor and Chair, Department of Orthopaedic Surgery
- Daria Mochly-Rosen, PhD, Professor, Department of Chemical and Systems Biology and Senior Associate Dean for Research
- Hugh O'Brodovich, MD, Professor and Chair, Department of Pediatrics
- Renee Reijo-Pera, PhD, Professor, Department of Obstetrics and Gynecology
- Kathy Renschler, MD, Community Physician
- Laura Roberts, MD, Professor and Chair, Department of Psychiatry and Behavioral Sciences
- Kevin Tabb, MD, Chief Medical Officer, Stanford Hospital and Clinics (and now President and CEO of the Beth Israel-Deaconess Medical Center in Boston);
- Alice Whittemore, PhD, Professor, Department of Health Research and Policy

On August 31, 2011 the Search Committee provided me with a list of finalists from a short list of eight candidates who visited Stanford from June - August 2011. I then further consulted with numerous national leaders as well as faculty and leaders in the Department of Medicine and at Stanford Medical Center and University, including the Provost, President, Trustees, Hospital

CEOs, and Board of Directors among others. I also visited the home institution of finalists and discussed the candidates with institutional and national leaders. Based on a complex register of assessments, recommendations and opinions along with a convergence of skills and opportunities, I am very pleased we have been successful in convincing Dr. Harrington that he and his family will flourish at Stanford.

Dr. Harrington's breadth of knowledge, his area of research, commitment to patient care and clinical excellence, and his leadership roles at Duke and nationally make him an ideal choice for this position. The DCRI is the largest such clinical research enterprise in the world - hosting over 200 faculty and over 1100 staff and encompassing nearly every medical discipline. The annual operating budget of the DCRI is over \$150 million, 40% coming from grants and contracts. The spectrum of clinical research in the DCRI extends from Phase 1-4 clinical trials - including programs in health services research. The DCRI also hosts research fellowship training programs for both MD and PhD students and fellows. There is no question that DCRI is a unique entity and, while we have no intention or expectation of replicating such a program at Stanford, the underlying knowledge and skills are important to our unique version of "Translating Discoveries." Further, Dr. Harrington's knowledge and prominence in population science and quantitative medicine converge remarkably with Stanford's burgeoning efforts in this evolving area of medicine, science and healthcare (see http://deansnewsletter.stanford.edu/archive/05_23_11.html#1 and below)

Dr. Harrington was born in Massachusetts and received a BA, *magna cum laude*, in English from the College of the Holy Cross. He then attended Dartmouth Medical School and received his MD from Tufts University School of Medicine in 1986. After training in Internal Medicine at the University of Massachusetts, where he was Chief Resident, he did a fellowship in Interventional Cardiology at Duke University Medical Center. He joined the Duke faculty as an Assistant Professor in 1995 and was promoted to Professor in 2003. He is Board Certified in Internal Medicine, Cardiovascular Disease and Interventional Cardiology and has been elected Fellow and held numerous leadership positions in the American College of Cardiology, American Heart Association and other national and international organizations. He has also served as an advisor and consultant to the NIH and FDA. Dr. Harrington was elected to the Association of American Physicians in 2011. His own research interests have focused on antithrombotic therapy for acute ischemic heart disease, the disease mechanism of acute coronary syndromes, clinical trial design and numerous other topics. Dr. Harrington is the author or co-author of over 350 scientific publications and reviews, and has served on numerous editorial boards and scientific advisory boards.

Of importance, Dr. Harrington is frequently described as a natural and energetic leader who is able to bring diverse groups of individuals together to achieve shared goals and objectives. He has been invited to lead important initiatives at Duke and nationally and is deeply committed to the future of academic medicine. Training future leaders and excellence in clinical care remain at the core of his mission, and he devotes part of every week to the practice of clinical cardiology - something he also intends to do at Stanford.

Bob Harrington and Rhonda Larsen have four daughters, and they have deep roots in North Carolina. While moving west to California is a major undertaking, both Rhonda and Bob are excited about the possibilities that stand before them - and we share that excitement and enthusiasm as well.

With Appreciation and Gratitude to Dr. Linda Boxer for Her Many Contributions as Interim Chair of the Department of Medicine

I want to thank Dr. Linda Boxer, Professor of Medicine - Hematology, for her truly excellent job in serving as Interim Chair of the Department of Medicine since August of 2010. I specifically asked Dr. Boxer to take on this role because of my great admiration for her work as a physician-scientist, leader and role model. To say that this was not an assignment that she was expecting or seeking would be a gross understatement. But Dr. Boxer took on her responsibilities with incredible commitment and leadership. She quickly put into place initiatives that improved the morale of the department and education opportunities for residents and students. She dramatically improved communication and interaction among faculty, trainees and staff. She appointed the chief of the Divisions of Infectious Diseases (Dr. Upinder Singh, Associate Professor of Medicine) and Pulmonary Medicine (Dr. Mark Nicolls, Associate Professor of Medicine) along with launching a number of important faculty and leadership searches.

Dr. Boxer also created important alliances with Stanford Hospital and Clinics and played an important role in conceptualizing the planning for the addition of a primary care initiative in the Department of Medicine's portfolio. While Dr. Boxer has long been respected for her contributions as Chief of the Division of Hematology, she has won the admiration and respect of countless individuals across the medical center for her role as Interim Chair. Without question I am and will always be one of those admirers - not only for what she has accomplished but because Dr. Boxer always puts the wellbeing of trainees, faculty and staff first and foremost in her decision making. And her decisions have focused on how to make the Department of Medicine stronger and better - something she has accomplished.

I am well aware that there are many views about how searches are conducted and concluded and what the necessary and even ideal characteristics of a department chair should be - which certainly undergo change and evolution over time. But in my discussions with countless individuals during the search for a new department chair, there is no doubt that respect and admiration for Dr. Boxer and the role she has played as Interim Chair were constant and deeply valued. Transitions are always a challenge for institutions and for individuals - but here too Dr. Boxer has put the future of the Department first and foremost and has pledged support and assistance to Dr. Harrington as the incoming Chair. For these and so many other reasons, I want to express heartfelt appreciation and ongoing respect for Dr. Linda Boxer - she is a wonderful individual and a terrific leader.

Appointment of Dr. Eila Skinner as the Chair of the Department of Urology

I am very pleased to announce the appointment of Dr. Eila Skinner as the next Chair of the Department of Urology beginning May 1, 2012. Dr. Skinner is currently Professor of Clinical Urology at the Keck University of Southern California School of Medicine, where she has served as Vice-Chair of Urology since 2009.

A Search Committee led by Dr. Sherry Wren, Professor Surgery, recommended Dr. Skinner as a finalist for the Chair of Urology. This Committee began its work in the summer of 2010 and included:

- Craig Albanese, MD, Professor, Department of Surgery - Pediatric Surgery
- Steve Alexander, MD, Professor, Department of Pediatrics - Nephrology
- Richard Barth, MD, Professor, Department of Radiology and Radiologist-In-Chief, Lucile Packard Children's Hospital

- Helen Bronte-Stewart, MD, Associate Professor, Department of Neurology & Neurological Sciences
- Stephan Busque, MD, Associate Professor, Department of Surgery - Transplantation
- Bertha Chen, MD, Professor, Department of Obstetrics and Gynecology; Glenn Chertow, MD, Professor, Department of Medicine - Nephrology
- Paula Hillard, MD, Professor, Department of Obstetrics and Gynecology
- Neeraja Kambham, MD, Associate Professor, Department of Pathology
- Jerry Maki, Vice President, Clinical Services, Stanford Hospital and Clinics
- Jim McCaughey, Chief Strategy Officer, Lucile Packard Children's Hospital.

I also want to thank Ms. Kendra Baldwin and the Office of Institutional Planning for their important contributions to the staffing and effective work of the Committee. The Committee invited 10 individuals to campus for comprehensive interviews and ultimately included Dr. Skinner in their list of three finalists. I am very pleased that Dr. Skinner has agreed to accept this important role at Stanford University Medical Center.

Dr. Skinner has roots on the Farm, having received her BA from Stanford in Human Biology, with Distinction and election to Phi Beta Kappa, in 1976. In 1983 she received her MD from the USC School of Medicine, where she graduated Alpha Omega Alpha and where she was also the recipient of the American Medical Women's Association Janet M Glasgow Award for Academic Excellence. She has achieved distinction as a teacher and educator. Among others acknowledgements for her teaching and mentorship, she received the Faculty teacher of the Year in Urology four times and the Outstanding Teacher Award at USC six times,

Dr. Skinner is an active surgeon with a national reputation for her expertise in urology and bladder cancer. Indeed, in my discussions with leaders around the country about her candidacy I heard over and over again that she was one of the very best and most highly respected urologic surgeons in the nation. She has been equally committed to the education and training of future surgeons and leaders at USC and nationally. She has served as Program Director for the Residency in Urology since 2000 and as Program Director of the USC Norris Cancer Fellowship in urologic oncology since 2009.

In addition to her role as Vice Chair of the Department of Urology, Dr. Skinner has served as the Chief of Staff of the combined medical staff of the USC University Hospital and the Norris Cancer Center. She has also served in numerous roles and committees at USC and the Norris Cancer Center.

Dr. Skinner made the decision to focus her efforts on clinical and teaching excellence during the first phase of her career. In a number of ways, she has taken the longitudinal career path now being explored by Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, and her colleagues to support career development of women in academic medicine. Dr. Skinner's interests in research are clinical and collaborative and are highly valued; they have focused on surgical interventions and quality of life for individuals with urologic cancer. She is the author and co-author of over sixty original articles and reviews and is a valued colleague to the scientific and medical communities at the Norris Cancer Center and USC.

Please join me in welcoming Dr. Eila Skinner to Stanford as our next Chair of the Department of Urology.

A Few Highlights from the 2012 Strategic Planning Leadership Retreat

On January 20-21st over 110 leaders from the School of Medicine, Medical Center and University gathered for the 11th Annual Strategic Planning Leadership Retreat since I became Dean in April 2001. In the January 9, 2012 Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/01_09_12.html) I recounted some of the issues, challenges and accomplishments of the past decade as a prelude to the remarkable opportunities that lie ahead.

In addition to sharing updates, setting new agendas and continuing to enhance and refine our ongoing strategic planning, one of the most valuable aspects of the annual retreat is the opportunity for our diverse leadership to share and better understand the complexity of our multifaceted goals and missions and how we (and they) can "connect some of the dots" (the theme of this year's retreat). In my opening and closing comments I reflected that each member of our community comes with her or his unique set of expertise, skills, knowledge and understanding. We each see Stanford Medicine through our own lens and not infrequently are unaware - or even unconcerned - about other features and aspects of our community. We come with some bias about what makes Stanford great - or where its challenges might lie - and often discover that some of our inherent biases benefit from broader sharing of ideas and points of view.

Whether we are students, trainees, faculty or staff members of the medical school and university, members of the medical center and hospital leadership, trustees or volunteers, we often assume that what is most important is what we, as individuals, care most deeply about. But what make us greater is when we join together in ways that make the whole greater than the sum of our parts. Of course that is a constant goal, always somewhat elusive, and, like Sisyphus, nearly always requiring renewed effort. While we have certainly made progress on a number of fronts during the past decade, new challenges constantly abound and things once accomplished need repair or replacement. Of course that is always true of institutions - and, dare I say, also of individuals. We are, after all, each stewards of the moment and our annual Strategic Leadership Retreat allows us to see where we are at the moment - and to reflect on the many tasks still to be undertaken and achieved in the future.

At the 2012 Leadership Retreat we heard updates on the planning activities we have launched in medical and graduate school education over the past 1-2 years. We also heard an update on the planning efforts underway in developing a broad initiative in population health sciences - which will clearly be a topic for future gatherings and discussions. We had the opportunity to examine our essential mission in basic research and to develop strategies with how to deal with the bioscience funding pressures that will abound in the years ahead. We critically examined how to better value the role of clinicians in our medical center community and how to preserve and enhance the future success of physician scientists. We also explored how to relate to some of our external communities - especially industry in the form of small and large biotech and big "pharma." Each of these has its champions and advocates and nearly all could define our institution or dominate our agenda. And some fully believe that one is more important than the others in defining what makes Stanford excellent. But it is really their balance and connection that makes us who we are today - and will make us even more outstanding in the future as we better share, understand and "connect the dots."

Rather than recounting all of the presentations I will simply highlight some of the major tasks and needs that emerged from our discussions and dialogue at the 2012 Leadership Retreat. For as much as we think we have done, there always seems so much more to do - of course that is a good thing!

- **Transforming Medical Education - led by Drs. Charles Prober, Clarence Braddock, Henry Lowe, Laura Roberts and Abraham Verghese**
 - Continue to enhance Stanford's commitment to the education and training of future physician scientists, scholars and leaders with refinement of the programs in Scholarly Concentrations, Med Scholars, MD-PhD and other joint degree programs. This remains a cornerstone of Stanford's medical education. To complement and expand the curriculum to address dominant issues in modern healthcare and new learning technologies Dr. Prober's team will undertake initiatives focusing on, among other issues:
 - Competency based, patient-centered learning strategies as well as other new learning strategies and pathways
 - Knowledge access, collaboration and learning technologies
 - Leadership, professionalism, and humanism, with attention to self-care and mental health
 - The need to collaborate more closely with PhD education programs on multiple different levels
 - The need to better address medical education across the continuum - from high school to medical and graduate school, residency and graduate medical education, fellowship and continuing medical education
 - Over the next year, exploring a reshaping of the basic science curriculum to be less lecture-based and more discussion and problem-oriented through the use of technology and new learning and teaching tools. Efforts to transform the conventional specialty based clinical clerkship rotations to longitudinal clinical learning experiences in diverse settings throughout undergraduate medical education.

- **Transforming Graduate Education - led by Dr. Dan Herschlag**
 - An update on a proposed major transformation in graduate education was presented by Dr. Dan Herschlag based on the work of a number of faculty groups. The proposed reforms would impact significantly Year 1 of PhD education, with significant changes in subsequent years as well. The overarching goals are to educate graduate students to think like scientists and train them to become leaders and innovators as well as to assure that all students pursue their "career of choice" and that "no graduate student is left behind." Among the proposed innovations are:
 - The expansion of "boot camps" for entering PhD students prior to the actual commencement of the first quarter
 - A comprehensive orientation for entering graduate students co-led by faculty and students
 - Development of both core courses in home departments as well as a common interdisciplinary program called the "biosciences kernel."
 - The core and kernel programs would be complemented by mini-course electives as well as career development and opportunity roundtables with faculty and alumni
 - A goal is to have all students start her or his thesis research by April of the first year and complete their qualifying exam by the end of the first year.
 - An additional goal is to shorten the time to degree to 5 years. This would be aided by annual goal setting discussions, organized programs and a

progression of skills and career workshops, and the addition of a second mentor for each student who would be focused on career development *per se*. Students would have opportunities to learn about career options from alumni helping each student to pursue her or his "career of choice."

- It is understood that graduate education is expensive and that changes in the curriculum along the lines being explored are costly. This will require institutional investments as well as major efforts to raise philanthropic support for graduate student fellowships.
 - The need to better integrate postdoctoral training into the overall education experience - as teachers and learners - was also underscored.
- **Sustaining and Enhancing Excellence in the Basic Sciences - panel with Drs. Jim Spudich, Jennifer Raymond, Denise Monach, Merritt Maduck, Ricardo Dolmetsch, Jim Ferrell**
- It is widely recognized that Stanford's basic science faculty and research programs are among the very best in the nation. By virtually every metric and measure of success (scientific impact, innovation, major awards and honors) Stanford faculty are at the very top. At the same time, every medical school and university is bracing for the reductions in federal support for research that seem inevitable and the impact they will have on research opportunities and creativity as well as on the level of stress experienced by faculty.
 - The common theme throughout the discussions on basic science research was the need to raise funds to help support both junior and senior faculty in the form of faculty scholar awards and professorships. A key feature of this funding would be to help supplement salary support in order to further optimize the use of grants and, even more importantly, to have a source of unrestricted funds that could be used for innovation and pilot projects.
 - Importantly, there was considerable discussion about ways that funds for research might be creatively developed and even shared among basic and clinical research faculty - ranging from micro-loans to seed and innovation funds.
- **Population Health Sciences at Stanford - panel discussion members included Drs. Julie Parsonnet, Atul Butte, Mark Cullen, Arnie Milstein, Marilyn Winkleby, Doug Owens and Steve Goodman**
- As noted in other communications, the last several years have witnessed several important convergences. One is the range of existing and new talent in the broad discipline of population health science (PHS) at Stanford, ranging from epidemiology to clinical and bioinformatics to outcomes based and health delivery research at the local, community and global levels. Another is the broad and deep set of opportunities and intersections in PHS that exist across the medical school, medical center and university.

The further convergence of PHS with early disease detection and diagnostic tools arising from genomics and proteomics as part of "prediction medicine," coupled with imaging and detection devices as well as informatics and statistics, offer the prospect of major transformations in health preservation and disease management. That there is now the likelihood for new funding in these areas from the federal government as well as from foundations, gifts and other sources makes this area

of research very exciting. Importantly, there was considerable enthusiasm at the Retreat about how Stanford can further develop a university and medical center - wide PHS initiative that would partner with our local and even global communities to create new models for promoting health, predicting risk for disease, detecting it early and delivering care in novel and new ways and settings.

The consensus at the Retreat was that we are well positioned to take a lead in this important area of science and medicine - and the question is how we need to organize ourselves to make Stanford uniquely successful. Given the level of support for this initiative that we heard expressed, we will now move forward to operationalize the recommendations that were made by the task force on PHS that has been moving this agenda forward over the past year. It is a very exciting initiative - which can be truly transformative.

- **Physician Career Development and Opportunities - Panel discussion led by Drs. Christy Sandborg, Ann Weinacker, Nancy Morioka-Douglas, Jeff Dunn and Andy Shelton.**
 - On the surface it seems strange to have a focused discussion on how to better support and value clinical medicine and clinical practitioners at Stanford. But that in fact is the case. In part this stems from Stanford Medical School's history - but it is also very much part of an institutional culture that places an understandable premium on research excellence but which has had a seeming lesser value for outstanding clinical medicine as a discipline. Certainly that is untenable - and unless changed would compromise Stanford's ultimate success as an academic medical center. While it is acknowledged that progress has been made in the past several years in valuing physicians as doctors (and clinician-educators) it is also true that much work remains to be done to achieve the needed balance of perceived excellence.
 - Part of the challenge is organizational (e.g., the fact that Clinician Educators are recognized as faculty in the medical school but not by the university) but attitude and culture are even bigger issues. Some panel presenters pointed out how some divisions and departments have set a tone that values clinical medicine and clinician educators by the department chair and senior faculty whereas others are less supportive or even dismissive. The culture of the department has a major impact on satisfaction and the sense of value and respect that is experienced by those practicing clinical medicine as their primary responsibility.
 - Over the past several years we have made major strides in enhancing the value and support for clinician educators - by competitive compensation, benefits (including housing benefits) and career development. But still many clinician educators express the feeling that they are less valued and respected than those in other faculty lines. That is clearly not acceptable.
 - While we have had task forces addressing the role of clinicians in the past -we clearly still have work to do to overcome barriers, whether cultural or organizational. Addressing this will be a major priority over the next year. This will require both a top down set of expectations as well as bottoms up shift in culture and value.

- **Physician-Scientist Career Development and Opportunities - Panel discussion led by Drs. Upinder Singh, Calvin Kuo, Joyce Liao, Ron Dalman and Melinda Telli**

Despite the stresses and challenges of funding and support, the general consensus of the panel was that the value and success of physician-scientists are alive and well at Stanford. There are excellent role models in medical and surgical specialties of faculty conducting basic research, clinical and translational research, and population health sciences research.

At the same time it was widely acknowledged that sustaining a career as a successful physician-scientist requires institutional support, mentoring, career flexibility and team participation. Collaboration between faculty in departments with those in institutes and centers provides unique opportunities. As with basic research, discretionary funding for innovation and faculty support are enormously important and are high priorities for the future.

Ironically, many physician scientists feel that they are less valued and appreciated for the clinical work (as compared to their research) but for a different reason than clinician educators. The assumption is that those doing part-time clinical care are simply less knowledgeable and effective in clinical medicine. Obviously this is a generalization, but it does underscore the importance of how assumptions and even stereotyping can impact perceive value. Clearly this too needs to be addressed.

Physician-scientists have many different career configurations and pathways, and flexibility and balance - for the long run - are important. Career paths and balance are highly variegated among surgical and medical disciplines and by the type of research or clinical care that is being conducted. But as with each of the other faculty roles, support from institutional leaders and financial and programmatic support are critical. Figuring out how to develop these resources going forward is the major unmet challenge - especially since it is clear that physician-scientists (along with the success of basic scientists and clinician-educators) are essential to our future - individually and collectively.

- **Innovation in Academia and Industry - Panel discussion led by Drs. Tom Okarma, Mark Tessier-Lavigne and Mike Rosenblatt.**

This panel differed from the others in that the members were all invited guests. They each have had exceptional careers in both industry and academia, and they each had different perspective based on their experiences, which ranged from small to large biotech to big pharma. Each of the presentations offered an important viewpoint, and each underscored the opportunities that come from effective academic-industry partnership. It was also clear that there is no ideal model of interaction and that the unique features of each institution have a major impact on the nature of the interaction. To be effective such interactions need to be true and respected partnerships - not one-way relationships. It was also clear that a number of the programs being developed at Stanford - most notably SPARK and Biodesign - are unique and that enhancing them could provide even more effective academic industry collaborations for the future.

Art Exhibition at the Li Ka Shing Center for Learning and Knowledge

On Tuesday January 24th the Stanford School of Medicine's Art Committee sponsored the Inauguration of the Art Exhibit for the Li Ka Shing Center for Learning and Knowledge. Dr. Paul Berg, Robert W. and Vivian K. Cahill Professor of Cancer Research, Emeritus, hosted a lovely event introducing the three artists, whose work will be displayed over the next six months. In doing so Dr. Berg also expressed thanks and appreciation to Mrs. Helen Bing, who donated much of the framed artwork and posters that currently adorn the LKSC. Working with Maggie Saunders, Niraj Dangoria and Mahmut Keskekci, the LKSC now has a more "lived in" feel - which is wonderful. But moving forward, the Art Committee has organized this exhibition of original works, which will personalize the LKSC even further and begin a journey in which the contributions of faculty, students, staff and friends will add depth and breadth to our wonderful Li Ka Shing Center for Learning and Knowledge. The Art Committee is also hoping to find support for a major installation by the New York artist Ms. Alyson Shotz, which would bring the LKSC Conference Center to a level of exceptional distinction.

Dr. Berg introduced the three artists whose work can now be seen on the first and second floors of the LKSC as part of the Inaugural Art Exhibition. They include:

- **Dr. Tom Merigan**, the George and Lucy Becker Professor of Medicine, Emeritus. Dr. Merigan began his interest in wildlife photography in earnest when he retired from his numerous leadership positions in infectious disease, diagnostic virology and AIDS research. He has put the same energy and creativity into his artistic pursuits as he did in science and medicine and has traveled to many parts of the world to "capture the essence of things living in the wild." Some of his extraordinary photography is on display on the first floor of the LKSC. An extension of his work can also be found at <http://www.pbase.com/merigan/profile>.
- **Dr. Ralph Greco** is currently the Johnson and Johnson Distinguished Professor of Surgery. He became interested in sculpture in the 1980s while living in Princeton, New Jersey, where he learned the techniques of stone carving. He has since created a wide array of abstract and occasional figurative sculptures, six of which are on exhibition on the second floor of the LKSC.
- **Dr. Joseph P. Kriss** was professor of medicine and radiology at Stanford School of Medicine beginning in 1948, and he served as the chief of the Division of Nuclear Medicine from 1958-1989. His distinguished career in medicine was complemented by his equally remarkable accomplishments as an artist - with works ranging from sculpture, oil paintings, miniatures and pioneering experimentation with digital art. Although Dr. Kriss died in 1989 his work lives on in many collections and galleries in the Bay Area and well beyond. His son Mark and daughter-in-law Jane attended the event, and some of Dr. Kriss' oil paintings are shown on the second floor of the LKSC.

We are indebted to the Art Committee for their work in planning for art and exhibits throughout the medical school. *Dr. Greco*, noted above as one of the artists, is also the chair of the Committee - which includes School of Medicine faculty and students, including Drs. Paul Berg, Audrey Shafer, Peter Koltai, Daria Mochly-Rosen; Lauren Chircus (Graduate Student), Atalie Carina Thompson (SMS 4), Sabrina Buell (Stanford Alumna), Jon Pierucci and Niraj Dangoria. Hilarie Faberman from the Cantor Center is also a committee member and Traudi Sedelmeyr, Maggie Saunders and Chris Shay provide staff support as needed.

I hope you enjoy these wonderful exhibits. Thanks to all!

2011 Faculty Fellows Graduation

On January 12, 2012, the Office of Diversity and Leadership hosted a graduation ceremony for the 2011 Faculty Fellows (see: <http://med.stanford.edu/diversity/leaders/fellows.html>). Dr. Hannah Valentine, Senior Associate Dean for Diversity and Leadership, presided over the ceremony, which recognized the accomplishments of the thirteen mid-career faculty who participated in the program over the past year. The success of this program, now in its seventh year, is a tribute to the vision and dedication of Dr. Valentine along with important contributions from: Dr. Julie Moseley, Director of Organizational Effectiveness; Ms. Jennifer Scanlin, Program Manager; and Lydia Espinosa, Program Coordinator. Special thanks must also go to the 2011 Faculty Mentors: Dr. Phil Lavori, Professor and Chair of the Department of Health Research and Policy; Dr. Christy Sandborg, Professor of Pediatrics and Chief of Staff at the Lucile Packard Children's Hospital; and Dr. David Stevenson, Professor of Pediatrics, Vice Dean and Senior Associate Dean for Academic Affairs.

The 2011 Faculty Fellows are:

- **Annelise Baron**, Associate Professor of Bioengineering
- **Mathew Bogyo**, Associate Professor of Pathology
- **James Brooks**, Associate Professor of Urology
- **A. Dimitri Colevas**, Associate Professor of Medicine
- **Tina Cowan**, Associate Professor of Pathology
- **David Fiorentino**, Associate Professor of Dermatology
- **Miriam Goodman**, Associate Professor of Molecular and Cellular Physiology
- **Steven Lindley**, Assistant Professor of Psychiatry and Behavioral Sciences
- **William Robinson**, Associate Professor of Medicine (Rheumatology)
- **Jane Tan**, Associate Professor of Medicine (Nephrology)
- **Ewen Wang**, Assistant Professor of Surgery (Emergency Medicine)
- **David Weill**, Professor of Medicine (Pulmonary and Critical Care Medicine)
- **Wei Zhou**, Associate Professor of Surgery (Vascular Surgery)

Please join me in congratulating the 2011 Faculty Fellow graduates. If you are interested in more information about this program or to apply to be a Fellow, please contact Jennifer Scanlin at jscanlin@stanford.edu.

Announcement: The Rathmann Family Foundation E4C Medical Education Fellowship in Patient-Centered Care

The Stanford School of Medicine Office of Medical Education is pleased to issue a call for applications to the ***Rathmann Family Foundation Educators-4-CARE (E4C) Medical Education Fellowship in Patient-Centered Care***. This program will provide the part-time salary support for a Stanford faculty, fellow, or chief resident to pursue further study and activities focused on the promotion of patient-centered care in medical education. Areas of focus may include instructional design, curriculum development, or evaluation. Alternatively individuals may have topical areas of focus, such as clinical skills, compassion and humanism, or professionalism.

The program will provide funding for protected time for one year to participate in a core curriculum in medical education theory, methods and research, to participate in ongoing curriculum development in undergraduate or graduate medical education in the area of patient-centered care, and development and to conduct a scholarly project in medical education related to patient-centered care. The fellow will participate in the Educators-4-C.A.R.E. (E4C) program,

serving as a mentored preceptor with selected E4C faculty in educational activities that are part of the E4C program.

The program will provide \$50,000 in salary support for one year, plus up to \$5,000 in project support for the fellow's project.

Interested individuals should submit the application (which may be found at the E4C website, <http://med.stanford.edu/e4c/rathmann.html>, at the bottom of the page), CV, and cover letter **by Wednesday, February 15th** to:

Clarence H. Braddock III, MD, MPH, FACP
Professor of Medicine and Associate Dean, Undergraduate and Graduate Medical Education
Director, Stanford Center for Medical Education Research and Innovation
Office of Medical Education
Stanford School of Medicine
251 Campus Dr., MC 5404
Stanford, CA 94305-5404
E-mail: cbrad@stanford.edu

About Educators-4-C.A.R.E

The Educators-4-C.A.R.E. program, launched in 2008, formally recognizes the critical importance of mentors and clinical teachers by providing tangible support to a cadre of skilled and dedicated teachers of the practice of medicine. As the name implies, the Educators-4-CARE program prepares students to internalize core values of the profession - Compassion, Advocacy, Responsibility, and Empathy - from the beginning and throughout medical school. Fifteen program faculty are supported for time to serve as teachers and mentors for a small number of students (~6) from each medical school class. After intense faculty development in principles and practice of patient-centered care, the E4C faculty formally teach bedside clinical skills to preclinical students as part of the Practice of Medicine course. In addition to these regular sessions, E4C faculty meet with their students from all years on a bimonthly basis, in the Doctoring with C.A.R.E. sessions. These interludes allow for important near-peer interactions, mentoring, and revisiting important and cross-cutting issues in medical practice, with a major focus on patient-centered care.

2012 School of Medicine Faculty Fellows Program

The Office of Diversity and Leadership received a large number of nominations for outstanding candidates for the 2012 Faculty Fellows program. Continuing with the original goals of the program, the review committee selected a class of junior faculty who will participate in this year long program. This year's program began with a welcome reception on January 24th. We are delighted to announce the selection of the 2012 Faculty Fellows: Drs. Valerie Baker (Obstetrics & Gynecology), Lorinda Chung (Medicine), Michael Haberecht (Psychiatry & Behavioral Sciences), Brian Hargreaves (Radiology), Charles Hill (Anesthesia), Jinah Kim (Pathology), Nishita Kothary (Radiology), Marco Lee (Neurosurgery), Marc Melcher (Surgery), Kari Nadeau (Pediatrics), John Oghalai (Otolaryngology), Suma Ramzan (Anesthesia), Kim Rhoads (Surgery), Juergen Willmann (Radiology), Cynthia Wong (Pediatrics) and Paul Zei (Medicine).

The Faculty Fellows program brings faculty members together for monthly meetings featuring invited leaders who serve as role models by sharing their leadership journeys, describing their leadership styles and addressing specific challenges they have faced in their careers. In addition,

small mentoring groups led by senior faculty mentors Drs. David Stevenson, Phil Lavori and Krisa Van Meurs meet monthly to reflect on the presentations. Fellows also engage in a structured development planning process aimed at identifying opportunities for growth and development. Candidates are nominated by their department chairs and other supervisors and are selected on the basis of their leadership potential and demonstrated commitment to diversity. A review committee consisting of Drs. Hannah Valentine, Julie Moseley, Garry Gold, Preetha Basaviah, and Robert Dodd selected this year's participants.

ACE/Sloan Foundation Medical School Faculty Flexibility Survey

Stanford is participating in a national awards competition sponsored by The Alfred P. Sloan Foundation--*The Sloan Awards for Faculty Career Flexibility*. Five medical colleges will each receive \$250,000 to enhance faculty career flexibility at their institutions, while two will receive \$25,000 awards recognizing their achievements for unique, innovative, and promising practices in career flexibility for their full-time faculty. **I am writing to ask for your support in completing the survey on which we will be evaluated for this award; a response rate of at least 50% is needed for an institution to be considered.**

If we achieve a response rate of 50%, the judges will consider YOUR responses on the Faculty Questionnaire regarding YOUR own experiences about the policies that exist at Stanford for faculty career flexibility. These policies are summarized in the document sent you in 2009, and again (updated) just before the holiday break, and a laminated copy via ID mail this week. This one-page summary contains information on tenure clock extension; parental and childcare leave; family and medical leave; childcare/eldercare assistance including our emergency backup program; consulting days; paid sabbaticals; family travel grants for conferences; part time options; and reduced teaching and clinical responsibilities. **All of these are available to you as a member of the Stanford faculty.**

On January 23rd, 2012 you received an email from ACE | Division of Leadership and Lifelong Learning asking you to take "The Faculty Questionnaire for Stanford Medical Faculty" which is available online, and should take approximately 20 minutes to complete. *Once completing this survey, you will be eligible to receive an Amazon gift card, and the opportunity to enter a raffle for zip car usage.*

PLEASE HELP US BE COMPETITIVE FOR THIS AWARD WHICH WILL PROVIDE MORE RESOURCES TO INCREASE OUR EFFORTS TO ENHANCE WORK-LIFE INTEGRATION FOR FACULTY.

Thank you for your assistance in this important effort.

Awards and Honors

- **Dr. Beverly Mitchell**, the George E. Becker Professor of Medicine and Director of the Stanford Cancer Institute, is the 2011 Albion Walter Hewlett Award winner. Dr. Mitchell has had an incredibly distinguished career in academic medicine and has had major impact on Stanford since she joined the University in 2005. She was selected for this enormously distinguished award by a panel of renowned prior Hewlett Award recipients. This prestigious award is presented by the Department of Medicine, and Dr. Mitchell is its 23rd recipient since it was initiated in 1983. Please join me in congratulating Dr. Bev Mitchell.

Appointments and Promotions

- **Daniel Becker** has been promoted to Adjunct Clinical Professor of Psychiatry and Behavioral Sciences, effective 12/01/2011
- **Paul D. Blumenthal** has been reappointed to Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 1/01/2012
Profile: http://med.stanford.edu/profiles/Paul_Blumenthal/
- **Bryan D. Bohman** has been promoted to Clinical Associate Professor of Anesthesia, effective 2/1/2012
Profile: http://med.stanford.edu/profiles/Bryan_Bohman/
- **Julie A. Collier** has been promoted to Clinical Assistant Professor of Anesthesia, and by courtesy of Pediatrics, effective 2/1/2012
Profile: http://med.stanford.edu/profiles/Julie_Collier/
- **Elizabeth A. Desmond** has been promoted to Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 3/1/2012
- **Barbara M. Egbert** has been reappointed to Clinical Professor (Affiliated) of Pathology, effective 9/1/2011
- **Ruth M. Fanning** has been reappointed to Clinical Assistant Professor of Anesthesia, effective 12/1/2011
Profile: http://med.stanford.edu/profiles/Ruth_Fanning/
- **Nathan D. Hart** has been promoted to Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 3/1/2012
- **Peter C. Heublein** has been appointed to Clinical Associate Professor (Affiliated) of Neurology and Neurological Sciences, effective 3/1/2012
- **Michael Jeng** has been reappointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 1/01/2012
Profile: http://med.stanford.edu/profiles/Michael_Jeng/
- **Peter E. Kane** has been reappointed to Clinical Professor of Radiology, effective 1/1/2012
Profile: http://med.stanford.edu/profiles/Peter_Kane/
- **Syed Aftab Karim** has been promoted to Clinical Assistant Professor of Neurosurgery, effective 2/1/2012
Profile: http://stanfordhospital.org/profiles/Syed_Karim
- **Joseph J. Kim** has been reappointed to Clinical Assistant Professor of Pediatrics, effective 11/1/2011
Profile: http://med.stanford.edu/profiles/Joseph_Kim/
- **Jeffrey E. Krygier** has been promoted to Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 5/1/2012
- **Leland E. Lim** has been appointed to Clinical Assistant Professor (Affiliated) of Neurology and Neurological Sciences, effective 2/1/2012
- **Margaret Neff** has been appointed to Clinical Associate Professor of Medicine, effective 1/23/2012
Profile: http://med.stanford.edu/profiles/Margaret_Neff/
- **Lily Nguyen** has been reappointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2011
- **Linda B. Nguyen** has been reappointed to Clinical Assistant Professor of Medicine, effective 9/1/2011
Profile: http://med.stanford.edu/profiles/Linda_Nguyen

- **Ming-Gui Pan** appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2011
- **Nhat Minh Pham** has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 11/1/2011
- **Miguel A. Sanchez** reappointed to Clinical Associate Professor (Affiliated) of Medicine, effective 9/1/2010
- **Minal Vasanawala** has been promoted to Clinical Assistant Professor (Affiliated) of Radiology, effective 4/1/2012
- **Dana L. Weintraub** has been reappointed to Clinical Assistant Professor of Pediatrics, effective 11/1/2011
Profile: http://med.stanford.edu/profiles/Dana_Weintraub/
- **Jennifer Reikes Willert** has been appointed to Clinical Associate Professor of Pediatrics, effective 4/1/2012
- **Denise Rettenmaier** has been promoted to Adjunct Clinical Assistant Professor of Medicine, effective 3/01/2012
- **Ann Weinacker** has been promoted to Professor of Medicine at the Stanford University Medical Center, effective 1/01/2012
Profile: https://med.stanford.edu/profiles/Ann_Weinacker/
- **Richard Wittman** has been promoted to Clinical Assistant Professor of Medicine, effective 4/1/2012
Profile: https://med.stanford.edu/profiles/Richard_Wittman/

Dean's Newsletter

February 21, 2012

The Stanford Challenge and Stanford Medicine

On December 31, 2011, Stanford University concluded its five-year Stanford Challenge Campaign, which began in October 2006 with the goal of raising \$4.3 billion. On February 7, 2012 President John Hennessy announced at a Gala Celebration at Maples Pavilion attended by donors, university faculty and staff and members of the community that the ***Stanford Challenge*** closed with \$6.2 billion “to seek solutions to global problems and educate leaders for a more complex world” (see: <http://thestanfordchallenge.stanford.edu/>). By every measure this is an extraordinary accomplishment as well as a tribute to the countless individuals who made gifts and donations, many of them quite exceptional. The School of Medicine participated in the University-wide Stanford Challenge and also exceeded its fundraising goal of \$991 million with a total of \$1.04 billion in cash received and \$1.22 billion in pledges and new activities at the end of December 2011.

The ***Stanford Challenge*** enabled transformations in people, programs and facilities across the University. At the School of Medicine, thanks to a number of principal gifts ranging from \$10 million to \$75 million, it made possible the initial phase of our medical school transformation in the form of the Li Ka Shing Center for Learning and Knowledge (LKSC) and the Lorry Lokey Stem Cell Research Building (Stanford Institutes of Medicine I). Also of major importance were the creation of two dozen new professorships (each at \$4 million) and exceptional contributions to major initiatives in Cancer (\$284 million), Cardiovascular Medicine, (\$54.7 million),

Immunity, Transplantation, and Infection (\$82.4 million), Neurosciences (\$130.1 million), Stem Cell Biology and Regenerative Medicine, including the Lokey Building (182.2 million), and education, including the LKSC (\$83.4 million).

These are highly significant accomplishments, for which I thank our incredibly generous and grateful donors and community members as well as our talented faculty and students – who were either the reason for the donations or who contributed to bringing them to fruition. I also thank the wonderful work of our Office of Medical Development. These gifts have been transformative – but they are also just a starting place for our future.

Over the past year we have also been transforming our Office of Development by better aligning it with Stanford Hospital and Clinics (SHC) as well as the University's Development Office, and with that we hope and envision that there will be a further transformation of Stanford University Medical Center over the next decade. Together with the leadership at SHC we are anticipating a Campaign for SUMC (whose official name is still being formulated) that will occur in two phases. The first phase will begin this year and extend over the next 2-3 years. A very significant portion of Phase I will focus on funding for the new Stanford Hospital, a \$2 billion construction project that is currently getting started. During Phase I, I am also asking our Development Office to give particular priority to raising funds for graduate education and for innovation funds for basic research, including faculty scholars and professorships for research faculty.

During Phase I, fundraising efforts for core programs in Cancer, Stem Cell Biology & Regenerative Medicine, Cardiovascular Medicine, Immunity-Transplantation-Infection and Neuroscience (focusing on clinical programs) will continue. We will also include in Phase I our programs in predictive medicine (including genomics, imaging and early diagnosis) coupled with our burgeoning efforts in global and population health sciences, including the transformation of health and healthcare delivery along with clinical and translational research (e.g., SPARK [<http://sparkmed.stanford.edu/>]). Highlighting these areas does not mean that other programmatic initiatives will not be pursued but that they will be guided by opportunity assessments. A broad opportunity and initiative assessment will be undertaken when a new dean arrives, and, following that, Phase II of the Campaign for Stanford Medicine will commence and likely continue for the subsequent 5-7 years. As it has in the past, the greatest fundraising successes will come from articulating a bold vision for how Stanford Medicine will transform the future. By doing so, we can build on our past accomplishments and use them to envision and then create the future.

Success in philanthropy is critical to the future success of Stanford Medicine. With the dramatic changes occurring in the support for research, the rising costs for education and the almost certain future declines in healthcare revenues, it is imperative that we protect our faculty as much as possible from the uncertainties of support from the public and private sectors, that we decrease the burden of debt for our students and the school, and support the most innovative and groundbreaking ideas possible. If the past helps predict the future, we have every reason to be optimistic.

“Occupy Medicine” is the Theme for the 21st Annual SUMMA Event

With the Occupy Wall Street Movement that began in Zuccotti Park on September 17, 2011, the word “occupy” has taken on new meaning, including an association with the “we are the 99%

slogan.” In less than six months there have been nearly 3000 “Occupy” communities formed – mostly focused on social and economic inequities around the world. Disparities and inequities have been areas of great concern in medicine as well, and so it is significant that the 21st Annual Premedical Conference sponsored by the Stanford University Minority Medical Alliance (SUMMA) chose “Occupy Medicine” as its banner and theme. It has an important resonance.

SUMMA has become a pillar of excellence in education, advocacy and support at Stanford, and in its annual conference it has brought several hundred high school and college students to campus to become enlightened and better informed and prepared for careers in medicine. Classes and demonstrations provide practical tips to prospective students about applying to medical school, including the value of academic performance, the MCATs and application and interviewing skills. Perhaps even more importantly, I am sure that prospective students are inspired by the intelligence, energy, commitment and dedication of our Stanford University medical students, who spend countless hours and days preparing for the annual SUMMA event.

Special thanks and appreciation goes to Miquell Miller, SMS III, who served as the 2012 SUMMA Coordinator and whose energy and passion are infectious. I am always very appreciative of the incredible effort our students, faculty and staff put into the SUMMA Conference. I am also deeply moved each year by the life journeys of some of our students as they describe the many forces and challenges that have shaped them to date. This year we witnessed the moving personal commentaries of Zachary Hernandez, SMS II, Andre Jamaal Pinesett, SMS I, and Allison Kim Truong, SMS I. I can’t help but imagine that every student in attendance has his or her own personal story – and that we are each also inspired by those told by the “Faces” speakers.

Over the past decades Stanford has made a strong commitment to enhancing the diversity of its students and faculty – and significant progress has been made. We are grateful for the broad diversity of our current students, which enriches our learning environment – and we recognize that much still remains to be accomplished. “Occupy Medicine” is certainly about increasing diversity in medicine but, on another level, it can also symbolize the need to take medicine back from the market-based forces that have so damaged its values and its very moral compass over the past decades. Both are goals we aspire to as we work toward the day when Stanford serves as the model for health and health care locally, nationally and globally. That too is something that will require our commitment and shared efforts as a community of students, faculty and staff.

A Respectful Learning Environment for Our Students

I have written in the past about our commitment to a Respectful Workplace, that is, “a work environment that is conducive to teaching and learning, research, the practice of medicine and patient care” (http://deansnewsletter.stanford.edu/archive/04_05_10.html#4). But, in addition, a respectful learning environment must be one of our highest priorities. Our commitment in this area for medical students is codified in our Standards of Conduct for the Teacher-Learner Relationship, which is published in the MD Program Handbook and Policy Manual (see: http://med.stanford.edu/md/policies/MD%20Program%20Handbook%202010_11.pdf).

I bring these Standards to your attention because of the 2011 results of a survey administered annually by the AAMC to graduating medical students from all US medical schools. Nationally, there are some disturbing trends in the percentage of students who have experienced

mistreatment during their training. “Mistreatment” in the survey includes verbal abuse or belittlement, inappropriate requests to perform personal services, and sexually inappropriate comments. Unfortunately, we are not free from some of these behaviors at Stanford. Among other questions, the survey asks about the learning environment, and students are asked whether they are aware of their schools’ policies regarding mistreatment. It turns out that in 2011 survey less than 70% of our students said they were aware of our policy, cited above. Of greater concern, some students reported mistreatment, particularly during clinical rotations and experiences. These results are cause for concern.

Every medical student and member of the instructional staff in the School of Medicine is expected to follow our policy, which lays out the School’s expectations for the proper treatment of students and the process for raising a concern if a student feels treated in a way inconsistent with our Standards. It is imperative that we have an environment that respects each individual and that promotes learning without fear of mistreatment or retaliation. This must be a priority for each of us, and I ask every member of our community to reflect on his or her behavior with a commitment to respect human dignity in educational and clinical interactions.

Under the leadership of Drs. Charles Prober, Senior Associate Dean for Medical Education, and Clarence Braddock, Associate Dean for Undergraduate and Graduate Medical Education, and Director, Stanford Center for Medical Education Research and Innovation, we are currently conducting an in-depth review of the full results of the 2011 survey, as well as similar surveys conducted of our residents and fellows by the ACGME. We will be communicating the outcome of this review in the months ahead and beginning a larger conversation across our entire medical center about how we can better meet our commitments to a Respectful Workplace and Learning Environment for all.

Because of the importance of this issue, I am copying below our Stanford Policy for your review:

Standards of Conduct for the Teacher-Learner Relationship Stanford School of Medicine

1. STANDARDS

- A. Stanford School of Medicine (SoM) is committed to providing a work and educational environment that is conducive to teaching and learning, research, the practice of medicine and patient care. This includes a shared commitment among all members of the SoM community to respect each person's worth and dignity, and to contribute to a positive learning environment where medical students are enabled and encouraged to excel. *Given their roles in the educational process and their inherently unequal positions vis a vis students, all instructional personnel (including faculty, residents, and other members of the healthcare team) are to treat students with courtesy, civility and respect and with an awareness of the potential impact of their behavior on such students' professional futures.*
- B. Conduct inconsistent with this policy can occur in a variety of forms and may seriously impair learning. In particular, instructional personnel are expected to create an environment in which feedback regarding their performance can be given openly by students without concern for reprisal, and which is free of exploitation, harassment, impermissible discriminatory treatment, humiliation, or

other mistreatment or abuse of medical students. Examples of conduct inconsistent with these standards might include:

- i. Sexual harassment
- ii. Physical or verbal abuse
- iii. Assigning duties as punishment rather than education
- iv. Requiring a student to perform personal services (such as shopping or babysitting)
- v. Unwarranted exclusion from reasonable learning or professional opportunities
- vi. Evaluating or grading on inappropriate criteria (or threatening to do so)
- vii. Harassment or discrimination on the basis of sex, race, age, color, disability, religion, sexual orientation, gender identity, national or ethnic origin, or any other characteristic protected by applicable law.

C. Note: The expectations stated in this policy primarily relate to the standards of conduct for instructional personnel. For their part, medical students are expected to adhere to similar standards of respectful and professional behavior, including (but not limited to) the standards of conduct for students set forth in the MD Program Handbook: Procedures, Policies and Essential Information such as sections 2.9 (School of Medicine Statement of Professionalism), 2.10 (School of Medicine Technical Non-Academic Standards) and 6.2 (Evaluation of Performance in Clinical Clerkships).

2. GUIDELINES FOR APPLICATION

- A. These standards of conduct are applicable to all SoM instructional personnel (including faculty, residents and other members of the healthcare team) in their interactions with Stanford medical students—whether on or off campus and whether in formal educational (such as clinical or classroom) or in social settings.
 - B. In general, a determination of whether specific conduct is inconsistent with this policy will depend on a case-by-case analysis of the particular facts and circumstances, and the use of a "reasonable medical student" standard.
 - C. Students subjected to abuse, discrimination, mistreatment or harassment have a right to seek timely and effective remediation with the full support of the SoM and Stanford University. In addition, retaliation and/or reprisals against an individual who in good faith reports or provides information in an investigation about conduct that may violate this policy is prohibited.
 - D. Conduct inconsistent with this policy may consist of repeated actions or may even arise from a single incident if sufficiently egregious.
 - E. In the review of conduct under this policy, other Stanford University and SoM policies and procedures (such as Stanford's Sexual Harassment and Consensual Sexual or Romantic Relationships Policy) may become relevant.
3. **THE RESPECTFUL EDUCATOR CONDUCT COMMITTEE (RECC)** The Respectful Educator Conduct Committee (RECC) is a standing committee to carry out the purposes and procedures set forth in this policy.

- A. The committee meets quarterly, and on an ad hoc basis if it is deemed necessary by the Chair.
- B. The committee is chaired by the Associate Dean for Medical Student Life Advising, who is hereafter referred to as the Chair.
- C. The composition of the committee includes the following as members:
 - i. The Chair
 - ii. One or more clinical students
 - iii. An Academic Advising Dean
 - iv. The Director of Graduate Medical Education (or designee)
 - v. The Director of Clerkships
 - vi. The Director of Educators for Care
 - vii. A Residency Training Program Director
 - viii. A Resident
 - ix. The Chair of the Physician Wellbeing Committee
- D. The RECC will keep such confidential records of its proceedings as are appropriate to support its purposes of education and concern resolution.

4. PROCEDURES

The following procedures for handling incidents of potential violations of the Standards of Conduct for the Teacher-Learner Relationship place a strong emphasis on resolving complaints informally. The procedures include advising and mediation. It is important to note that the procedures do not preempt other formal or informal channels available within the University. ***It is recommended that students should -- as a first step-- contact the Chair of the RECC to review the various options that are available (on a confidential basis as that status is granted to the Associate Dean for Medical Student Life Advising -- <http://med.stanford.edu/md/student-development/confidentiality.html>). The Chair of the RECC is empowered to explore with the student a plan of action that may include some or all of the steps described below.***

- A. **Informal** - Concern about potential violations may be handled by communication with various individuals, including but not limited to the following:
 - i. Direct discussion (by the student or others) with the alleged offender.
 - ii. Conversation (by the student or others) with individuals such as the chief resident, attending physician, clerkship director, and/or Educator For Care (E4C) faculty.
 - iii. The Chair of the RECC may present the concern to all or a portion of the RECC, and to such third parties that the Chair of the RECC deems appropriate for seeking an informal resolution.
 - iv. The Chair of the RECC also may in his/her discretion refer the matter to an alternate available University process or office, such as an existing

grievance process or the Sexual Harassment Policy Office or the Director of the Diversity and Access Office.

- v. Direct conversation by the student with confidential resources including but not limited to the Ombuds, Counseling and Psychological Services, and the Deans of Religious Life.

Informal solutions to address the problem may be recommended and/or pursued such as (but not limited to) systems changes or educational interventions. The Chair of the RECC will be available throughout the process to discuss with the student the status of the matter, including any potential resolution.

B. Formal -- If no resolution is reached and the student wishes to proceed with a more formal grievance or complaint process, the Chair of the RECC may refer the student to other existing processes or may (in an appropriate case) accept from the student a written grievance or complaint to use the procedure described below.

- i. The student should set forth in writing the substance of the grievance or complaint, the grounds for it and the evidence on which it is based, and the efforts taken to date to resolve the matter. It is at this stage that the matter becomes a formal grievance or complaint.
- ii. The grievance or complaint document should be submitted to the Chair of the RECC. A grievance should be filed in a timely fashion, i.e., normally within thirty days of the end of the academic quarter in which the action that is the subject of the grievance or complaint occurred. A delay in filing may be grounds for rejection of that grievance or complaint.
- iii. The Chair of the RECC will review the grievance or complaint and (if it reflects an appropriate use of the process) will then promptly (within 7 days) transmit the grievance or complaint to the Senior Associate Dean for Medical Education (SADME) for handling.
- iv. The SADME shall promptly initiate a review, which should normally be completed within sixty days. The SADME may attempt to resolve the matter informally, and may refer the matter (or any part of it) to a grievance officer or other designee, who will evaluate and/or address the matter as the SADME directs. The SADME may also, in appropriate cases, remand the matter to the appropriate administrator (including to the administrative level at which the grievance or complaint arose) for further consideration.
- v. In undertaking this review, the SADME (or his or her designee) may request a response to the issues raised in the grievance or complaint from any individuals believed to have information the reviewer considers relevant, including faculty, staff and students.
- vi. The SADME (or his or her designee) shall issue his or her decision in writing, and take steps to initiate such corrective action as is called for (if any). Conduct meriting discipline shall be brought to the attention of the appropriate disciplinary process.
- vii. Appeal
 - a. If the student is dissatisfied with the disposition by the SADME (or his or her designee), he or she may appeal to

the Dean of the School of Medicine. The appeal should be filed in writing with the Dean within ten days of the issuance of the decision by the SADME (or his or her designee); a delay in filing the appeal may be ground for rejection of that appeal.

- b. The Dean may attempt to resolve the matter informally, and may refer the matter (or any part of it) to a grievance appeal officer or other designee, who will review the matter at the Dean's direction. The Dean also may remand the matter to the appropriate administrator (including to the administrative level at which the grievance arose) for further consideration.
- c. The Dean should normally complete his or her review of the appeal and issue his or her decision in writing within forty-five days. That decision is final. It is not subject to further review by any other University process.

viii. General Provisions

- 1. *Time Guidelines* -- The time frames set forth herein are guidelines. They may be extended by the Chair of the RECC, the SADME or the Dean, as applicable, in his or her discretion for good cause (including for reasons relating to breaks in the academic calendar).
- 2. *Advisers* -- A student initiating or participating in a grievance or complaint under this procedure may be accompanied by an adviser in any discussion with the Chair of the RECC, the SADME, the Dean, or their designees (such as a grievance or grievance appeal officer); such adviser must be a current Stanford faculty, staff member or student.
- 3. *Ombuds* -- Students should be aware that the University Ombuds (<http://www.stanford.edu/dept/ocr/ombuds>) is available to discuss and advise on any matters of University concern and frequently helps expedite resolution of such matters. Although it has no decision making authority, the Ombuds' Office has wide powers of inquiry.
- 4. *Sexual Harassment and Disability related issues*- For further information and resources concerning sexual harassment, students should refer to the web page of the Sexual harassment Policy Office at <http://harass.stanford.edu>. For further information and resources concerning accessible education, students should refer to the web page of the Office of Accessible Education at <http://www.stanford.edu/group/DRC/>
- 5. *No retaliation*- Stanford University prohibits retaliation or reprisals against individuals based on their pursuit in good faith of a grievance or complaint under this procedure, or their participation in good faith in the grievance or complaint process.

6. *Standards for Review*- If the grievance or complaint involves a decision that is being challenged, the review by the SADME, as well as the review by the Dean on appeal, usually will be limited to the following considerations:
 - a. Were the proper facts and criteria brought to bear on the decision? Were improper or extraneous facts or criteria brought to bear that substantially affected the decision to the detriment of the grievant?
 - b. Were there any procedural irregularities that substantially affected the outcome of the matter to the detriment of the grievant?
 - c. Given the proper facts, criteria, and procedures, was the decision one which a person in the position of the decision maker might reasonably have made?

5. EDUCATION

The Stanford School of Medicine will provide ongoing education to promote a positive learning environment and discourage violations of the standards of conduct for the teacher-learner relationship. Such education serves several purposes. First, it promotes an environment of respect for each person's worth and dignity. Second, it informs students that there are procedures available for them to register concerns of educator conduct violations, which can be investigated and addressed without fear of retaliation. Third, it informs instructional personnel of the SoM's standards of conduct and procedures for responding to allegations of violations of these standards. This policy will be included in the MD Program, Resident and Faculty handbooks and posted on the medical school website. Educational sessions on this topic will be introduced during the pre-clerkship curriculum and readdressed early in the clerkship curriculum. Educational sessions on this topic will also be presented to educational personnel including but not limited to at forums such as resident orientation, department meetings, and staff meetings. The materials and methods for providing this education will be the responsibility of the Respectful Educator Conduct Committee.

The President's Budget, the NIH Budget and the Health of Our Nation's Investment in Science

President Obama released his FY2013 budget on Monday, February 13th, which for the Department of Health and Human Services (HHS) projects \$941 billion in outlays. Of this, Medicare comprises 56%, Medicaid 30% and other entitlement programs 6%, leaving 8% of the HHS budget for discretionary programs – which includes NIH. We all recognize that there is a long journey of debate and negotiation (or not) ahead as the President's budget goes through the legislative process. But some issues are already notable – even if they become part of the political debate over the months ahead. First, the Obama Administration is proposing significant reductions in Medicare Indirect Medical Education (IME) payments and also a reduction in the support for Children's Hospital Graduate Medical Education (GME) support. Needless to say, the months ahead will almost certainly witness big debates on Medicare and other entitlement programs as the political debate about healthcare reform heats up with the pending Supreme Court hearing on the Affordable Care Act scheduled for this March and the Presidential elections in November.

The FY2013 President's budget proposes freezing the NIH budget at \$30.9 billion. While this is better than it might have been, several issues obtain. First, this proposal will also be subject to debate in the Congress. Second, even if the budget remains flat, the purchasing power of NIH dollars continues to decline. In addition, whatever budget is passed could be subject to a significant reduction (currently forecast at 8%) if the "sequester" goes into effect in January 2013 because of the failure of the so-called Super Committee to address the budget deficit agreement in 2011. This also comes on the heels of the Consolidated Appropriations Act, 2012 that was signed into law on December 23, 2011, which lowered the salary limitation on NIH grants from Executive Level I (\$199,700) to Executive Level II (\$179,700) and which went into a phased-in effect beginning with new grants beginning December 24, 2011 (see: http://grants.nih.gov/grants/policy/fy2012_salary_cap_faqs.htm for more details). This has an impact on faculty and institutions.

Although many details remain to be determined, current forecasts are that in FY13 NIH will discontinue out-year inflationary allowances for competing and continuation grants, reduce non-competing continuation grants by one percent below the FY12 level, and negotiate the budgets of competing grants to avoid growth. A further forecast of approaches to grant management being considered at the NIH are reflected in Dr. Sally Rockey's February 15th communication (<http://nexus.od.nih.gov/all/2012/02/15/president%E2%80%99s-2013-budget-and-nih-research-grants/>), which states that the NIH will continue current policies that allow new investigators to receive grants at rates equal to those of established investigators and will also "establish a process for additional scrutiny and review of awards to any principal investigator with existing grants of \$1.5 million or more in total costs" – a policy that has been in place at the National Institute of General Medical Sciences for some years. As you likely know, the NIH has been floating the idea of managing its grant portfolio by limiting the number of awards per PI, limiting the amount of funds/PI, and reducing or limiting the size of awards. They have already limited salaries of PIs, as noted above.

While it is understood that the continuing economic crisis and still looming deficit have led to these policies and others still to come, it is also clear that these events seriously threaten our nation's leadership and competitiveness in science and innovation. I wrote about this in an Op-Ed that was published in the January 31, 2012 San Jose Mercury News and that I include below in case you missed seeing it (see: http://www.mercurynews.com/opinion/ci_19862392?IADID=Search-www.mercurynews.com-www.mercurynews.com or below)

Budget Super Committee's Failure Puts Medical Research at Risk

Because of our national investment in basic biomedical research through the National Institutes of Health, the United States is the world leader in discoveries in the life sciences. Americans have benefited from new treatments and cures that have improved the health of adults and children and prolonged many lives. Indeed, we are the envy of the world in discovery and innovation.

But we are now on a precipice. As a result of the inability of the so-called congressional Super Committee to deliver a budget proposal, lawmakers are required to make \$1.2 trillion in cuts, half from defense and half from domestic programs, including research sponsored by the

NIH. Reducing our investment in medical research surely would slow the remarkable progress we have made in new fundamental discoveries that can ultimately improve the health of our nation's citizens.

Consider the evidence: The death rates for heart disease and stroke have fallen by 60 percent and 70 percent, respectively, since World War II. Over the past 15 years, the incidence of cancer has fallen by 11.4 percent among women and 19.2 percent among men because of better detection methods and more effective treatments. Today, individuals diagnosed in their 20s with HIV -- once considered a death sentence -- may receive antiretroviral therapy and live to age 70 or beyond. These and other advances in our health have been built on basic scientific research -- work that may not have had a clear application when it was conducted but which opened the way to a better understanding of human biology. This knowledge then was translated into new tools or devices to diagnose, treat and prevent disease.

For instance, today's lifesaving treatments for HIV were built upon advances in a basic understanding of how the immune system works. I witnessed this personally when I began my own work in pediatric AIDS, which would not have been possible without the basic science discoveries about retroviruses that took place more than a decade before HIV was even known. Similarly, at Stanford, work aimed at understanding how immune cells recognize antibodies ultimately led to a groundbreaking treatment for non-Hodgkin's lymphoma, as well as other debilitating conditions.

Innovation and discovery not only improve human health, but they also are vital to jobs and economic recovery. One recent study noted that nearly a half-million jobs across the country were directly or indirectly supported by NIH funding. Overall, NIH funding produced nearly \$70 billion in new economic activity in 2010. Here in California, the effect of this research accounts for \$5.3 billion in economic activity and 35,734 jobs. An additional effect on medical research and jobs in California has taken place because of our residents' investment in stem cell research through Proposition 71, making us the world leader and principal beneficiary of this incredibly important research agenda.

President Barack Obama and Congress need to remember that the U.S. Medical research enterprise is an economic juggernaut and the envy of the rest of the world -- a leadership position that no one wants to lose. More important, both the President and Congress should think about how the health of future generations depends on the basic research being done today. Cuts to our basic biomedical research today may save money in the short run, but it will come at the cost of our most precious resource: the health and well-being of our children and grandchildren.

Clearly the months ahead will be important in clarifying the impact of the NIH budget and other funding sources on our research mission. There is no question that this is a time of increased stress for our faculty and that, despite their enormous talents and accomplishments, the current and almost surely continuing funding environment will impact a number of them quite directly. Certainly we want to do all we can to protect our faculty from these funding challenges, but there are obvious limits to our discretionary resources. That is why raising funds for innovation and for the support of research faculty through faculty scholar awards and professorships is such a high priority for all of us.

Coming in 2013: Liaison Committee on Medical Education Re-accreditation

The Liaison Committee on Medical Education (LCME) is the national body that accredits all medical schools in the United States and Canada; it is jointly sponsored by the Association of American Medical Colleges (AAMC) and the American Medical Association (AMA). Medical schools are required to renew their accreditation with the LCME a minimum of every 8 years. The last accreditation Stanford received from the LCME was in October 2005, and therefore our re-accreditation is due to occur no later than October 2013.

As a part of the re-accreditation process, all schools are required to engage in a comprehensive self-study, followed by a site visit from the LCME. The entire re-accreditation process typically lasts about 18 months. Although activities around the LCME re-accreditation process have already begun, I want to let you know that we will be officially launching our self-study in May 2012, with self-study teams beginning to meet in the Fall.

The self-study process is comprehensive and will require the participation of many of our faculty, staff, and students. In the coming months, we will be appointing several self-study teams, each charged with reviewing specific components of our medical education program. As a part of this process, our students will also undertake an independent (and confidential) self-study that provides an avenue for them to assess their own educational experience.

Although these activities are required for re-accreditation, they do afford the opportunity, using the accreditation standards as benchmarks, to focus on continuous quality improvement of our medical education. Of course, we have been doing continuous improvement even without an immediate LCME review – but we will be able to do this more comprehensively. While it also will appear to many of us that we just completed the LCME review, the reality is that we are now ready for another reaccreditation cycle!

Dr. Charles Prober, Professor of Pediatrics and Senior Associate Dean for Medical Education, will be the faculty lead for the 2013 LCME re-accreditation project. Aarti Porwal, Manager of Strategic Initiatives in Education in the Office of Institutional Planning, will serve as the lead administrative coordinator. I will continue to update you as we progress in our re-accreditation efforts.

The Senate's H.E.L.P. Committee Holds Hearings on Pain in America

On February 14th I had the opportunity to testify before the US Senate H.E.L.P. (Health, Education, Labor and Pensions) Committee led by Senator Tom Harkin (D-IA) on the topic of “Pain in America: Exploring Challenges to Relief.” My testimony reflected the work of the Institute of Medicine’s reported entitled “*Relieving Pain in America: A Blueprint for Transforming Prevention, Care, Education and Research.*” A summary of the testimony I submitted to the Senate H.E.L.P. Committee follows:

Summary of the Presentation of Philip A. Pizzo, Dean of the Stanford University School of Medicine, on the Institute of Medicine Report “*Relieving Pain in America*” to the US Senate H.E.L.P Committee on February 14, 2012

I would like to share with you some of the conclusions and recommendations from the Institute of Medicine Report on *Relieving Pain in America: A Blueprint for Transforming Prevention, Care, Education and Research*. This 2010 Patient Protection and Affordable Care Act required that HHS, through the NIH, charge the IOM to conduct this study. I served as the chair of a 19-

member committee that initiated its work in November 2010 and delivered the final report to the Congress and NIH in June 2011.

We found that the magnitude of pain in the United States is astounding. More than 116 million Americans have pain that persists for weeks to years. That this number does not include children, individuals in nursing homes or chronic care facilities, prisons or the military, makes the impact even more significant. The total cost of pain is \$560-635 billion per year. This is higher than the costs of cancer, cardiovascular diseases and diabetes together. This includes nearly \$100 billion annually from federal and state budgets. The Committee fully recognizes the magnitude of these expenditures and appreciates that more effective and efficient approach to pain management and preventions must consider cost as well as effectiveness.

The Committee was charged to review and quantify the public health significance of pain, identify barriers to pain care, determine special populations impacted by pain, identify the tools and technologies to treat pain and enhance pain research along with public-private partnerships in support of pain research, care and education.

In preparing its report we reviewed the literature, held public meetings and workshops, received testimony and comments from more than 2000 Americans, and commissioned a review on the economic burden of care. We concluded that relieving acute and chronic pain and the resultant suffering will require of cultural transformation in how pain is perceived and judged both by people with pain and by the health care providers who help care for them. The overarching goal of this transformation should be gaining a better understanding of pain of all types and improving efforts to prevent, assess and treat pain. The Committees report offers a blueprint for achieving this transformation that included 16 recommendations that addressed the public health challenges, pain care and management, the education of patients, communities and providers and that addressed research needs and opportunities. To help establish priorities, the IOM Committee recommended that four of its 16 recommendations be implemented by the end of 2012 and that the remaining twelve recommendations be completed before the end of 2015 and then be maintained on an ongoing basis. These recommendations are as follows:

Immediate -- Complete by the end of 2012

- The Secretary of HHS should create a comprehensive population-level strategy for pain prevention, treatment, management and research
- The Secretary of HHS along with other federal, state and private sector entities should develop strategies for reducing barriers to the care of pain -- focusing in particular on populations disproportionately affected by and undertreated for pain
- Through CMS, the VA, DoD, health care providers, insurers and others - support collaboration between pain specialists and primary care clinicians, including referral to pain specialists when appropriate.
- The Director of the NIH should designate a lead institute at the National Institutes of Health that is responsible for moving pain research forward, along with an increase in the support for and scope of the Pain Consortium. This should involve pain advocacy and awareness organizations and should foster public private partnerships

Twelve other recommendations focus on public health, clinical care, education and research issues that should be completed by 2015. Taken together, these recommendations serve the goal of creating a comprehensive, population-level strategy for pain prevention, management and research. The scope of the problems in pain management is daunting, and the limitations in the

knowledge and education of health care professional are glaring. But the medical community must actively engage in the necessary cultural transformation to reduce the pain and suffering of Americans. Importantly the cultural and social transformation needed to alleviate pain in America will require the collaboration of the healthcare provider community with patients and their families who are suffering from pain, including their communities, professional societies and advocacy organizations as well as state and federal government. New public private partnerships and a broad concerted level that addresses pain as a public health initiative as well as an individuals source of suffering will be necessary if we are to make progress in alleviating pain. We must all be part of the dialogue and the solution.

The Senate H.E.L.P. Committee hearings were recorded on C-SPAN (see: <http://www.c-span.org/Events/Senate-HELP-Committee-Looks-at-Medical-Costs-for-Chronic-Pain/10737428332-1/>) and included testimonies from:

- Lawrence Tabak, DDS, PhD, Principal Deputy Director, National Institutes of Health
- Philip Pizzo, MD, Dean, Stanford University School of Medicine
- William Maixner, DDS, PhD, Director, Center for Neurosensory Disorders, University of North Carolina at Chapel Hill
- Christine Veasley, Executive Director, National Vulvodynia Association
- John Sarno, MD, Professor of Clinical Rehabilitation Medicine New York University School of Medicine.

The testimonies and commentaries were far ranging and, not surprisingly, most poignantly expressed through the voices of individuals suffering from chronic pain. Ms Veasley was an articulate spokesperson for patient needs and for research – both basic and clinical.

While not myself a pain expert, I have become increasingly informed about the magnitude of pain in America and the need to address it more fully. Hopefully the IOM Report and its recommendations, coupled with actions by the Congress and the Department of Health and Human Services, will take action on the important needs that have been identified. Fortunately for our own community, we have one of the nation's most articulate and respected leaders in pain medicine and research, Dr. Sean Mackey, Associate Professor and Chief of the Pain Management Division at Stanford. Dr. Mackey was a member of the IOM Committee on Pain in America and contributed significantly to its work and recommendations. His work at Stanford and nationally give hope that progress will be made on this important and under-appreciated problem in the years ahead.

Approved Uses of Stanford University School of Medicine Logo

The Stanford University School of Medicine logo is well-established and familiar to us – we see it every day on our web site (including the home page of this Newsletter), on our buildings and in written materials. But not everyone may be aware that the use of our logo and name is governed by University policy (http://adminguide.stanford.edu/15_5.pdf), and that it is the responsibility of each member of the School of Medicine community to use the logo and Stanford name correctly. The University has assigned responsibility for approving the use of Stanford's name and "marks" used in connection with medical activities to the Dean of the School of Medicine.

I am pleased to announce that we now have a ***“Logo & Name Use Guide”*** online (<http://med.stanford.edu/logo/>) that briefly outlines the guidelines that will assist you when you seek to use the School logo and name, whether on a website or a tote bag. However, it is important to underscore that you may only use the School of Medicine logo in conjunction with academic and research-related events. Moreover, if the logo will appear externally (outside of Stanford), a draft copy showing how the logo will be used needs to be submitted to the Dean’s Office for review. Please direct additional questions regarding the School of Medicine logo to Kristin Goldthorpe, Project Manager in the Dean’s Office. Thanks to Kristin for developing this very useful resource. I urge you to review the Guide and refer to it any time you plan to use the School logo or name for external purposes.

Celebrating Two Dozen Years of Contributions by Dr. Richard Tsien

On Tuesday, January 31st the Department of Molecular and Cellular Physiology celebrated Dr. Richard Tsien’s more than two decades of exceptional contributions to Stanford and the world of science and medicine. Of special significance, Dr. Tsien founded the department in 1988 and served as its first chair. More broadly, his remarkable career has traversed basic and clinical sciences, has touched countless of medical and graduate students, impacted scores of trainees, faculty and staff and has resulted in major insights and discoveries that have brought distinction and many honors and awards. In August 2011 Dr. Tsien became the Inaugural Director of the new Neuroscience Institute at the NYU Langone Medical Center and, since January 2012, the Druckenmiller Professor of Neuroscience there. Until assuming his new leadership position, Dr. Tsien was the George D. Smith Professor at Stanford. Colleagues from throughout the Stanford community joined the celebration to thank Dick Tsien for his exceptional contributions and to wish him, his wife Julia, and their family joy and success in this exciting new chapter in their lives.

Awards and Honors

- **Dr. Norbert Pelc:** On February 9th the National Academy of Engineering announced the election of 66 new members (see: www.nae.edu <http://www.nae.edu>), including Dr. Norbert Pelc. Election to the National Academy of Engineering is among the highest professional distinctions accorded to an engineer. It honors those who have made outstanding contributions to "engineering research, practice, or education, including, where appropriate, significant contributions to the engineering literature," and to the "pioneering of new and developing fields of technology, making major advancements in traditional fields of engineering, or developing/implementing innovative approaches to engineering education." Dr. Pelc is Professor and Associate Chair for research in the Department of Radiology and Professor of Electrical Engineering (by courtesy) at Stanford University. He is cited by the NAE for development of algorithms and technologies for MRI, CT, and hybrid X-ray/MRI imaging.” Please join me in congratulating Dr. Pelc for this major honor.

Appointments and Promotions

Steven Artandi has been promoted to Professor of Medicine, effective 2/1/2012.

Zev D. Bryant has been reappointed to Assistant Professor of Bioengineering, effective 3/1/2012.

Kim R. Butts Pauly has been appointed to Professor of Radiology, effective 2/1/2012.

Annelynn Chang has been appointed to Assistant Professor of Dermatology at the Stanford University Medical Center, effective 2/1/2012.

Christopher H. Contag has been promoted to Professor of Pediatrics and of Microbiology and Immunology and, by courtesy, of Radiology, effective 1/1/2012.

Edward Damrose has been promoted to Associate Professor of Otolaryngology – Head and Neck Surgery, effective 2/1/2012.

Peter Fitzgerald has been reappointed to Professor (Research) of Medicine, effective 2/1/2012.

Garry E. Gold has been promoted to Professor of Radiology and, by courtesy, of Orthopaedic Surgery, effective 2/1/2012.

Edward Graves has been promoted to Associate Professor of Radiation Oncology, effective 2/1/2012.

Henry H. Hsia has been reappointed to Associate Professor of Medicine at the Stanford University Medical Center, effective 2/1/2012.

Jennifer Johns has been appointed to Assistant Professor of Comparative Medicine at the Stanford University Medical Center, effective 2/1/2012.

Gordon Li has been appointed to Assistant Professor of Neurosurgery at the Stanford University Medical Center, effective 2/1/2012.

David H. Liang has been reappointed to Associate Professor of Medicine at the Stanford University Medical Center, effective 3/1/2012.

Claude M. Nagamine has been reappointed to Assistant Professor of Comparative Medicine at the Stanford University Medical Center, effective 2/1/2012.

Harlan Pinto has been reappointed to Associate Professor of Medicine and, by courtesy, of Otolaryngology – Head and Neck Surgery, at the Veterans Affairs Palo Alto Health Care System, effective 3/1/2012.

Aaron Straight has been promoted to Associate Professor of Biochemistry, effective 2/1/2012.

Dean's Newsletter
March 5, 2012

Moving Forward Toward a New Curriculum for Graduate Education

Following the themes articulated at the 2012 Strategic Planning Leadership Retreat, Dr. Dan Herschlag, Professor of Biochemistry and Senior Associate Dean for Graduate Education and Postdoctoral Affairs, held a Town Hall Meeting on Tuesday, February 21st to discuss proposed revisions to the curriculum for graduate student education in the biosciences at Stanford. As noted in previous communications, our mission and philosophy in this area are evolving in ways that include:

- Educating each student to “think like a scientist”
- Training leaders and innovators
- Leaving no graduate student behind, by addressing advising and mentoring and choice of labs to work in
- Encouraging each student to pursue her or his career of choice, regardless of which path that follows (e.g., research, education, industry), and honoring that choice.

Dr. Herschlag outlined some of the key components of the curriculum changes being considered and solicited feedback and engagement – from the students who attended the Town Hall as well as those who were unable to participate but who hopefully will become involved as the process moves forward. Among the innovations being considered is a “biosciences kernel core course” that will foster an interdisciplinary experience and that will be project and not lecture based. A key feature of this course will be small group discussions that emphasize concepts over facts and that promote active learning as well as the acquisition of critical analytic skills in reading and understanding the literature, design of experiments and communication and collaboration. Crucial components will include, first, learning how to develop hypotheses, and, second, determining the right experimental approaches for addressing them. An additional goal is to have the educational process become a multi-year effort that incorporates mini-courses and roundtables that expose students to core concepts as well as leaders in science broadly defined. Included will be interactions with alumni who are pursuing broad career pathways – from academia to industry and beyond.

Providing mentorship is an essential component of our education goals – both for research proficiency and for career development. These two types of mentoring should be performed and coordinated by different individuals. Another key goal is shortening the time to degree, with a goal of accelerating the time students enter destination labs, do qualifying exams and complete all requirements. In total this should be five years or less.

Following an interactive discussion on these and related issues at the Town Hall, several action items were delineated, including:

1. ***Student and Advisor Rights and Responsibilities.*** There was great interest in developing a “Rights and Responsibilities” document for students and advisors. The goal for this document is to engender open, ongoing discussion between students and advisors and to empower students, particularly as a needed and additional resource for their transition from undergraduate to graduate studies. A group will meet to craft this document; additional students and faculty interested in participating this process should contact Melanie Bocanegra, Assistant Dean for Graduate Education (mbocanegra@stanford.edu).

2. **Curriculum.** There was enthusiasm for the proposed curriculum changes delineated above as well as a note of caution, since they will entail a new “experiment” in their own right. In this respect the Town Hall participants felt it was important that the new interdisciplinary course not be required of students, although it is likely that at least several Home Programs will strongly recommend it to their students. It was noted that Drs. Tom Clandinin (Neurobiology), Tim Stearns (Biology) and Aaron Straight (Biochemistry) will be developing an initial syllabus over the next month to share with departments and core courses directors in order to help optimize the timing and format of courses for the coming academic year. In addition, funds have been allocated from the Dean’s Office to help in the development of graduate mini-courses. A call for proposals will go out in March, and faculty, students and postdocs will be encouraged to apply for funding to help revamp and improve existing courses and to develop new mini-courses, with special emphasis on interdisciplinary experiences and short, intensive special topics.
3. **Second Mentor Program.** Students have previously identified the desire for “second mentors” – mentors beyond their advisor and thesis committee who can provide mentoring in a number of ways, including career advice, outside perspectives, and free and nonjudgmental discussion. Louis Fernandes, President of Stanford Biosciences Student Association (SBSA), has initiated a survey of students to nominate faculty members who they feel would be particularly adept in this role. There is additional interest in expanding this program to local alumni. Accordingly, if you know of faculty or alumni who you think would excel in this role, please contact Louis Fernandes (louisf@stanford.edu).
4. **“Career of Choice” and Alumni Forum.** Students often first begin to consider career options outside of academia in their 3rd or 4th year of graduate school. Often when research projects are launched, there is considerable excitement and anticipation. Of course, research is filled with as many frustrations and disappointments (often more) than moments of exhilaration. While students may seek to follow a career outside of research for a number of reasons, sometimes these pursuits grow out of the understandable frustration and disappointment that can accompany pursuit of quite challenging research questions. But it is important that each student, regardless of the nature of his/her particular research experience, explore and search for a career of choice – the career that will bring the most fulfillment and allow that student to ultimately contribute the most to society. Further, as there are many ways to utilize training in science, students should not feel compelled to take one path or be judged for the paths that they choose – or don’t choose.

Indeed, students should recognize from day one in graduate school that part of their journey involves reflection and consideration about their longer-term career goals. To facilitate this process, and to celebrate the great and diverse careers of our alumni, the Graduate Education office will hold an Alumni Forum for all 3rd and 4th year graduate students. More details will follow; everyone was advised that this *May 4th will be a starting point and that an event is planned for that date that will provide an introduction to alumni and career paths, discussions with alumni, and advice from our outstanding Career Center on how to begin the path to one’s career of choice.*

5. **Student/Faculty Focus Groups on Advising, Curriculum and Careers.** The Graduate Education office will host a series of focus group discussions in March and April to seek input for the new biosciences website, new student orientation, proposed workshops and

wellness programs. Your participation and feedback will help shape initiatives that address the holistic development and well-being of our students. Students and faculty interested in joining these efforts should e-mail Dan Herschlag (herschla@stanford.edu).

Even though the attendance of graduate students in this first Town Hall Meeting was somewhat low, the event was a great beginning, and I do feel very confident that interest and participation will continue to grow as new programs are explored and initiated. It is great to see the progress that has been made, and I am grateful to the collaboration among students, staff and faculty that is moving this initiative forward. It is very exciting!

Approval of Principal Investigator Status for Clinician Educators For Research

Two important issues have converged that, as a result, have permitted a decision to expand the opportunity for Clinician Educator faculty in the School of Medicine to serve as principal investigators (PIs) on research studies related to the practice of medicine. The Provost granted approval for this expanded opportunity following a small group meeting with him on February 21st that included Drs. Mark Cullen, Professor of Medicine and Chief of the Division of General Medical Services in the Department of Medicine; Harry Greenberg, Joseph D Grant Professor of Medicine and Senior Associate Dean for Research; Ann Arvin, Lucile Salter Packard Professor of Pediatrics and Vice Provost and Dean of Research; and myself. The underlying premise of the proposal we made to the Provost is that Clinician Educators, who are on the front lines of medical practice, have a unique opportunity to advance new models and methods of medical care delivery – from improving quality and efficiency of medical care to innovative ways of promoting health and treating disease in ambulatory, hospital and community settings.

Until now Clinician Educators have been permitted to be PIs only on multicenter industry sponsored clinical trials on which they served as site director (but not the overall PI). This new opportunity will permit a Clinician Educator to request a PI waiver from her or his division or department chair for studies that relate to the practice of medicine at Stanford. Final approval of a PI waiver request for a Clinician Educator will be granted by the Senior Associate Deans for Research and for Academic Affairs. Waivers could be granted for such projects as studies of therapeutic interventions, innovations in medical practice and healthcare delivery, novel approaches to diagnosis, disease stratification or disease management. Once approved, a research application on which the Clinician Educator is the PI can be submitted to federal or state funding agencies (e.g., NIH, the Agency for Healthcare Research and Quality, the Patient Oriented Outcomes Research Institute) or private foundations.

This new opportunity for Clinician Educators who wish to pursue a research opportunity is timely in light of the major changes underway in healthcare reform and policy in the US – as well as the funding sources addressing quality, patient outcomes, healthcare delivery, etc. It is also timely in light of our burgeoning efforts in developing Population Health Science at Stanford, a topic that is covered in a February 27th article by Krista Conger entitled ***“Population Studies at Heart of Initiative to Improve Health”*** (see: <http://med.stanford.edu/ism/2012/february/population-0227.html>).

I also want to underscore that this additional opportunity for our Clinician Educator faculty is optional and offers an opportunity for members of our community to pursue issues and questions

they deem important. At the same time, it is important to view the primary role of Clinician Educators as providing outstanding patient care and education – missions that are equally important to the success of Stanford as an academic medical center.

Academic Senate Considers Revisions to University Conflict of Interest

The topic of financial conflict of interest has engendered considerable discussion and debate over the past decade, particularly regarding payments or gifts, small and large, from industry to physicians as well as institutions. The Stanford School of Medicine *“Policy and Guidelines for Interactions between the Stanford University School of Medicine, the Stanford Hospital and Clinics, and Lucile Packard Children's Hospital with the Pharmaceutical, Biotech, Medical Device, and Hospital and Research Equipment and Supplies Industries (“Industry”)”* can be found on our website at <http://med.stanford.edu/coi/siip/policy.html>. Thanks to the incredible support of faculty, students and staff, Stanford’s policies have been transparent and are seen as a model of excellence in the nation.

While the potential for conflict of interest in education and patient care is still a very important issue, with rare exception (http://deansnewsletter.stanford.edu/archive/12_13_10.html#4), concerns about conflicts related to these areas have been well managed. And when the Physician Sunshine Act, which mandates public disclosure of industry payments to physicians, was passed as part of the Affordable Care Act in March 2010, Stanford was already ahead of almost every other academic center. Specifically, all payments to faculty from industry above \$5000 that are related to their consulting activities are shown on individual publicly accessible CAP (Community Academic Profile) listings

(http://deansnewsletter.stanford.edu/archive/03_30_09.html#6 and http://deansnewsletter.stanford.edu/archive/08_31_09.html#5). Over the past year or so, our discussions about academic-industry relations have focused increasingly on how we can foster more effective research collaborations that both avoid conflict and promote research activity and technology transfer. This was the topic of a Think Tank held on October 15, 2011 (see: http://deansnewsletter.stanford.edu/archive/10_24_11.html#1) and also a panel at our *Strategic Planning Leadership Retreat* (see: http://deansnewsletter.stanford.edu/archive/01_30_12.html#4).

Against this backdrop, new requirements regarding conflict of interest and commitment in research have been mandated by the National Institutes of Health (<http://www.gpo.gov/fdsys/pkg/FR-2011-08-25/pdf/2011-21633.pdf>). These new requirements, which become effective on August 24, 2012, necessitate revisions in Stanford’s conflict of interest policy on research, which was first approved on April 14, 1994 and modified on December 2, 2004. On February 23, 2012, Professor Peter Michelson, chair of the Academic Senate Committee on Research, presented an overview of the proposed revisions to the “Faculty Policy on Conflict of Commitment and Interest” (RPH4.1) that are needed to make Stanford compliant with the new federal guidelines (see: <http://news.stanford.edu/news/2012/february/faculty-senate-three-022312.html>). The revisions presented followed months of intense work led by Harry Greenberg, Joseph D. Grant Professor of Medicine and Senior Associate Dean for Research, and Ann Arvin, Lucile Salter Packard Professor of Pediatrics and Vice Provost and Dean of Research, who carefully reviewed the federal guidelines and distilled the key issues that Stanford needs to address.

Given the nature of some of the changes that are coming, it seems useful to highlight some of the major revisions that are being mandated by the NIH, as follows:

- The threshold at which a relationship must be managed, if FCOI (Financial Conflict of Interest) is present will be decreased from \$10,000 in the current policy to \$5,000 in the 2012 revision
- Before grant dollars can be spent on PHS awards, institutions must sign an assurance to NIH that they have managed all FCOIs related to the specific project and this assurance needs to be updated annually
- The institution must determine whether a faculty member's outside interests overlap with/are related to their institutional responsibilities and if so, if they are related to their research/scholarship responsibilities (and specifically to PHS funded research. If that is the case the institution must determine whether an FCOI exists, rather than allowing the faculty member to make this determination
- Almost all sponsored travel must be reported to the institution
- The amount of information that must be reported to the NIH if an FCOI exists is significantly increased
- Institutions must make accessible to the public within 5 days all FCOIs overlapping with NIH/PHS funded awards
- A requirement for investigator training before engaging in any PHS-funded research and every four years thereafter
- If noncompliance with regulations found, a series of significant review procedures required to take place

The Academic Senate will vote on the proposed changes to the policy on conflict of commitment and interest at its March 8, 2012 meeting. Further announcements about the revised policies will be made later in the year.

School of Medicine Faculty Fellows Program Begins Seventh Year

On February 21st Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, launched the first meeting of the 2012 School of Medicine Faculty Fellows Leadership Program (<http://med.stanford.edu/diversity/leaders/fellows.html>). This is the 7th year of this highly successful program, which is sponsored by the Office of Diversity and Leadership (ODL). Its purpose is to help mid-level faculty build community and learn about leadership, through monthly dinners with selected Stanford leaders who share and discuss their “leadership journey” as a way of promoting dialogue and discussion. In addition, Faculty Fellows participate in small group mentoring groups as well as personal career development planning. I had the opportunity to be the speaker at the first session and was pleased, once again, to find an exceptional group of faculty who are eager and ready to learn about leadership – and more importantly, to become effective leaders themselves.

The Faculty Fellows Leadership Programs is one of the major initiatives by the Office of Diversity and Leadership (ODL) and is part of a comprehensive effort to further enhance diversity and leadership in the medical school, medical center and university. Dr. Valantine recently offered reflections on the programs she has so ably led in a Podcast available on our

Stanford website (<http://med.stanford.edu/121/2012/valantine.html>). I am very pleased to note that over the years graduates of the Faculty Fellows Leadership Program have taken on important leadership roles in the medical school, university and hospitals. Faculty Fellows are selected through a competitive nomination process. They represent an important investment and resource for the future of Stanford Medicine.

The 2012 Faculty Fellows include:

Dr. Valerie Baker, Assistant Professor, Department of Obstetrics & Gynecology
Dr. Lorinda Chung, Assistant Professor, Department of Medicine
Dr. Brian Hargreaves, Associate Professor, Department of Radiology
Dr. Michael Haberecht, Clinical Associate Professor, Department of Psychiatry
Dr. Charles Hill, Clinical Assistant Professor, Department of Anesthesia
Dr. Jinah Kim, Assistant Professor, Department of Pathology
Dr. Nishita Kothary, Assistant Professor, Department of Radiology
Dr. Marco Lee, Clinical Assistant Professor, Department of Neurosurgery
Dr. Marc Melcher, Assistant Professor, Department of Surgery
Dr. Kari Nadeau, Associate Professor, Department of Pediatrics
Dr. John Oghalai, Associate Professor, Department of Otolaryngology
Dr. Suma Ramzan, Clinical Assistant Professor, Department of Anesthesia
Dr. Kimberly Rhoads, Associate Professor, Department of Surgery
Dr. Juergen Willmann, Assistant Professor, Department of Radiology
Dr. Cynthia Wong, Clinical Assistant Professor, Department of Pediatrics
Dr. Paul Zei, Clinical Associate Professor, Department of Medicine

Although it is disappointing to not have any faculty from a basic science in this group of Faculty Fellows (which we have had in previous groups), I am very pleased by the range of interest, disciplines and career plans in the 2012 Faculty Fellow Leadership Group. We wish them well on this new journey.

Celebrating Diversity: Increasing the Numbers of Women in Science Needs to Start Earlier

As an institution of higher learning we are enriched by the diversity of our community – students, faculty and staff. Because we value diversity we are unabashed in our desire to continue to enrich our community with the widest range of diversity possible. We recognize that it makes the education of our students deeper and prepares them better for the global community in which they will live and work. We appreciate that a more diverse faculty and staff are more likely to engage in research questions and scholarship that are more cognizant of biological and environmental variation and the need to study questions in ways that have broad relevance. We also recognize that the diversity of the patients who seek our care is best addressed by healthcare providers who appreciate the impact of societal and cultural issues on health and healthcare.

On Friday, March 2nd we had the opportunity to celebrate diversity during a lunchtime event for Bioscience Graduate applicants who were visiting Stanford for admission interviews. Dr. Melanie Bocanegra, PhD, a 2003 graduate of Stanford's Cancer Biology Program, and currently Director of Biosciences Diversity Programs and Assistant Dean of Graduate Education (<http://med.stanford.edu/phd/diversity/>), organized and led this important event. Dr. Bocanegra and others spoke about why diversity is so important to our graduate education programs and

missions and also described the wide array of services and organizations that are in place to support and promote diversity (see: <http://med.stanford.edu/phd/diversity/organizations.html>).

Because of the efforts of many faculty, students and staff, Stanford School of Medicine's MD and PhD classes have become increasingly diverse in the numbers of women and minorities underrepresented in medicine. Efforts have also been made to increase the diversity of our faculty, as is well described by Dr. Hannah Valentine, Senior Associate Dean for Diversity and Leadership in her Podcast noted above (<http://med.stanford.edu/121/2012/valantine.html>). Despite progress, which has been slower than any of would like, a sobering study entitled "*Survival Analysis of Faculty Retention in Science and Engineering*" was recently published in the February 17th issue of *Science* by Deborah Kaminski and Cheryl Geisler that raises additional concerns (see: <http://www.sciencemag.org/content/335/6070/864.full.pdf?sid=32301a51-6781-496d-ac0b-96a8b1f61675>). In conducting their study, the authors tracked 2966 science and engineering faculty from 14 universities from the time they were appointed until they left the university. Kaminski and Geisler observe that women left the university at a significantly higher rate than men, most dramatically about 5 years after they were appointed, particularly during the pretenure period.

Attrition of junior faculty, especially women, has been a major concern and is one of the major areas of study and intervention by our Office of Diversity and Leadership. The impact of attrition is incredibly important especially since there is no difference in the success of tenure between men and women nationally (this is true at Stanford as well). However, as Kaminski and Geisler note, "the long span of faculty careers provides considerable inertia in the system". Their conjecture is that *"it would take about 40 years for a department to match the gender composition of the hiring pool because of the long length of faculty careers. Although...data do show an increase in the percentage of women hired, the goal of 50% women may not be achieved until as late as 2050. Thus, if current trends continue, it may take 100 years before women are 50% of the faculty in STEM (science, technology, engineering, medicine) departments."*

While acknowledging the value of such projections, they must compel us to not simply accept their conclusions but to find ways to shorten the timeline to achieving a more diverse faculty. Thankfully, a number of programs to address faculty development and attrition are now in place or will soon be introduced. They deserve our attention and support. Equally, we need to do more to improve the pipeline – by fostering opportunities for more women and minorities to enter graduate programs in science and engineering. This needs to include programs that extend to the high school level or even earlier and that create opportunities for support before and during college as well as during graduate school, postdoctoral training and early faculty appointments. There is unlikely to be one simple solution – but there are a lot of things that can, and must, be done if we are to be more successful. And more successful we must be.

Dr. Margaret Hamburg will be the 2012 School of Medicine Commencement Speaker

I am very pleased to announce that Dr. Margaret Hamburg, Commissioner of the Food and Drug Administration, will be the School of Medicine Commencement Speaker on Saturday, June 16th. I have had the privilege of knowing and working with Dr. Hamburg in a number of different settings and have tremendous respect for her commitment to science and medicine. Dr. Hamburg became the 21st Commissioner of the FDA on May 18, 2009. Her distinguished career began on

the Stanford campus, where her father, David Hamburg, was Chair of the Department of Psychiatry and her mother, Beatrix, was the first African-American woman to attend Vassar College and to earn a degree from the Yale University School of Medicine, which had previously excluded black students.

Peggy Hamburg received an MD degree from Harvard Medical School, trained in internal medicine and did research in neuroscience at the Rockefeller University and NIH. It was when her career embraced research in AIDS that I first interacted with Dr. Hamburg at the NIH. She subsequently became the Commissioner of the New York City Department of Health and Hygiene and had a major impact on public health in NYC and, by extension, globally. She was then appointed Assistant Secretary for Policy and Evaluation in the US Department of Health and Human Services from 2001-2005. She then became founding vice president for biological programs at the Nuclear Threat Initiative, where she also served as senior scientist until her appointment to the FDA.

Dr. Hamburg's remarkable career as a physician and scientist as well as in public health, safety and leadership make her a wonderful choice as our 2012 Commencement speaker.

Awards and Honors

- **Dr. Robert Jackler**, The Edward C. and Amy H. Sewall Professor in Otorhinolaryngology, was recently inducted as an Honorary Fellow of the Royal College of Surgeons of England at a ceremony in London. During his visit, Dr. Jackler gave a graduation oration to the diplomates of the Royal College who had recently completed their surgical training. Congratulations to Dr. Jackler.

Appointments and Promotions

Sherry Beaudreau has been promoted to Clinical Associate Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 4/1/2012.

Lindsay Butler-Kolderup has been promoted to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 4/1/2012.

Michael Joshua Cisco has been reappointed to Clinical Assistant Professor of Pediatrics, effective 7/1/2011.

Amanda Dill has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 3/1/2012.

James Faix has been appointed to Clinical Professor of Pathology, effective 3/1/2012.

Michele Kastelein has been reappointed to Clinical Assistant Professor of Medicine, effective 9/1/2011.

Camilla Kilbane has been appointed to Clinical Assistant Professor of Neurology and Neurological Sciences, effective 9/1/2012.

Sanjay Kurani has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 12/1/2011.

Jason Lifshutz has been promoted to Clinical Associate Professor of Neurosurgery, effective 8/1/2012.

Amen Ness has been promoted to Clinical Associate Professor of Obstetrics and Gynecology, effective 3/1/2012.

Anna J. Park has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 3/1/2012.

Andrea H. Polesky has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2011.

Alan Ringold has been reappointed to Clinical Professor of Psychiatry and Behavioral Sciences, effective 9/1/2011.

Kerstin Rosen has been appointed to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 12/1/2011.

Kamala Shankar has been reappointed to Clinical Associate Professor (Affiliated) of Orthopaedic Surgery, effective 9/1/2011.

Andrew Shin has been reappointed to Clinical Assistant Professor of Pediatrics, effective 7/1/2011.

Carla B. Shnier has been reappointed to Clinical Assistant Professor (Affiliated) of Anesthesia, effective 9/1/2011.

Carly E. Siskind has been promoted to Clinical Assistant Professor (Affiliated) of Neurology and Neurological Science, effective 4/1/2012.

Amy J. Voedisch has been promoted to Clinical Assistant Professor of Obstetrics and Gynecology, effective 3/1/2012.

Doreas C. Yao has been reappointed to Clinical Associate Professor (Affiliated) of Radiology, effective 9/1/2011.

Dean's Newsletter

March 19, 2012

The 2012 Internship Match

Friday, March 16th was “Match Day” for our graduating medical students. This is the day each year when graduating medical students across the country learn, at the exact same moment (9:00 a.m. PDT), where they will do their internships. Match Day is run by the National Residency Match Program (NRMP), which was started 60 years ago to address the intense competition that had emerged among teaching hospitals over the recruitment (and hiring) of interns. Despite a

challenge in the US Supreme Court, the NRMP has been an institution – if not a tradition – in medicine since 1952. Anyone who has participated in the “Match” almost certainly remembers the exact moment and the details that surrounded opening the envelope that would indicate the hospital and program where they would spend the next several years of their life. It’s an indelible experience.

The NRMP uses an algorithm that matches a rank order list of preferences of the applicants for the teaching hospitals and training programs they wish to attend. The process is structured to place the applicant into her or his first choice and, if that is not possible, into her or his second choice and so on until the applicant obtains a “tentative match” or all the applicant’s choices are exhausted. Clearly the goal of the applicant is to achieve the highest preference possible – and to not go unmatched. According to the NRMP, *“matches are ‘tentative’ because an applicant who is matched to a program at one point in the matching process may be removed from the program at some later point, to make room for an applicant more preferred by the program, as described in the second case above. When an applicant is removed from a previously made tentative match, an attempt is made to re-match that applicant, starting from the top of his/her list. This process is carried out for all applicants, until each applicant has either been tentatively matched to the most preferred choice possible, or all choices submitted by the applicant have been exhausted. When all applicants have been considered, The Match is complete and all tentative matches become final.”* There is also a special process for the “couples” match for those who are eligible and chose to commit to it.

According to the NRMP the 2012 Match had more than 95% of the approximately 16,000 graduating seniors of US allopathic schools “match” to a residency program, the highest number in three decades. Overall in the 2012 Match there were 38,377 participants who applied for 26,772 positions. The other applicants included 2360 graduates of osteopathic schools, 4279 US citizens from international medical schools and 6923 non-US citizen/graduates of international medical schools. As in past years, dermatology, orthopaedic surgery, otolaryngology, plastic surgery, thoracic surgery and vascular surgery were the most “competitive” fields for applicants. Even though emergency medicine and anesthesiology programs each added incremental positions, all were filled. For US seniors who matched, 56.5% received their first choice and 81.6% received one of their top three choices. For non-US seniors, nearly 49% went unmatched. Our Stanford students achieved much higher-ranking preferences – but, as Dr. Charles Prober, Senior Associate Dean for Medical Education, pointed out at the Annual Match Day Celebration on Friday evening, what is most important is that the student and teaching hospital are happy with their new association and that each have a great experience during their years together. Each student is unique and virtually every training program offers important education and training opportunities.

All of our 75 Stanford participating students matched in 2012. Although students matched in 16 specialty areas, 23 (31%) matched in internal medicine, 9 (12%) students matched in radiology, 8 (11%) matched in pediatrics and 18 (24%) matched in all surgical specialties combined. There was a clustering of teaching institutions and geography with the three most popular programs being Stanford (22 students), Harvard (12 students) and UCSF (11 students). While graduating students will be distributed to 12 states, two states (California and Massachusetts) will host 55 (73%) of them. Here’s the list of graduating students and the institutions where they will begin their internship.

The Stanford School of Medicine 2012 Match List

<i>Amir, Omar</i>	Brigham & Women's Hosp- MA	Internal Medicine
<i>Anavitarte, Adriana Pamela</i>	Stanford Univ Progs-CA	Pediatrics
<i>Arroyo, Anna Chen</i>	Stanford Univ Progs-CA	Internal Medicine
<i>Arumainayagam, Dinah Lukshani</i>	O'Connor Hospital-CA	Family Medicine
<i>Atmadja, Melanie Alexandra</i>	Stanford Univ Progs-CA	Pediatrics
<i>Badowski, Natalie Janet</i>	Stanford Univ Progs-CA	Emergency Medicine
<i>Barakat, Monique</i>	Stanford Univ Progs-CA	Internal Medicine
<i>Barreto-Chang, Odmara Liz</i>	Stanford Univ Progs-CA U Washington Affil Hosps- WA	Surgery-Preliminary Child Neurology
<i>Bauer Huang, Sarah Louise</i>	Stanford Univ Progs-CA	Pediatrics
<i>Birnie, Krista Lauren Camara-Quintana, Joaquin Q.</i>	Yale-New Haven Hosp-CT San Mateo Behavrl Hlth/Recvry Svcs-CA	Neurological Surgery Psychiatry
<i>Cardenas, Alexander Saul</i>	Stanford Univ Progs-CA Santa Clara Valley Med Ctr- CA	Internal Medicine Transitional
<i>Chen, Christina Ann</i>	Stanford Univ Progs-CA	Radiology-Diagnostic
<i>Chen, Yi-Ren</i>	Stanford Univ Progs-CA Brigham & Women's Hosp- MA	Neurological Surgery Anesthesiology
<i>Chow, Vinca</i>	Oregon Health & Science Univ-OR	Internal Medicine
<i>Chun, Carlene Lihalakha</i>	Stanford Univ Progs-CA	Orthopaedic Surgery
<i>Corcoran-Schwartz, Ian</i>	Yale-New Haven Hosp-CT	Neurological Surgery
<i>Cord, Branden John</i>	Childrens Hospital-Boston- MA	Peds/Childrens Hosp
<i>Czechowicz, Agnieszka Dorota</i>	Stanford Univ Progs-CA Harbor-UCLA Med Ctr-CA U Minnesota Med School- MN	Surgery-Preliminary Radiology-Diagnostic Internal Medicine

<i>Yeh, Judy Y.</i>		
<i>Zhu, Ruo Peng</i>		

In addition to the 75 graduating Stanford medical students who matched at various teaching hospitals, the Stanford Hospital & Clinics and the Lucile Packard Children's Hospital will be receiving new residents from across the country this summer. Based on comments from clinical department chairs and program directors, each discipline was enormously happy with its "match." Overall the match for our graduating students and for incoming ones to SHC and LPCH is outstanding. Congratulations to all.

USNWR Medical School Rankings – An Evolving Process

Another annual "rite of spring" that takes place with varying degrees of anticipation is the US News and World Reports (USNWR) ranking of graduate schools – which primarily means schools of medicine (and in particular the MD program of the school) along with schools of engineering, law, business, education. Graduate programs (i.e., PhD) in the biosciences are

ranked less frequently and are not generally directly part of the “medical school” ranking *per se*. The topic of the USNWR rankings is one that I have written about frequently in the past, focusing primarily on the metrics that have long been employed that gave undue emphasis to size over quality, weighting too heavily the total amount of research funding from the NIH – which can be strongly influenced by the number of faculty. Over the years I have presented corrections to the ranking metrics, including balancing total research funding with the amount of competitive funding per faculty member, as has been done by USNWR in ranking schools of engineering. This and other changes were employed last year as well as this year and have provided some balance to the size and quality assessment. *Based on the metrics used for research medical schools, Stanford School of Medicine is ranked #4 by USNWR for 2012.* Of course each year is a new adventure.

Technology and the Rules on the Practice of Medicine at Stanford: A Reaffirmation

In the May 9, 2011 Dean’s Newsletter, I reported the most recent version of the rules on the “Practice of Medicine” at Stanford as of that date (see:

http://deansnewsletter.stanford.edu/archive/05_09_11.html#9). These rules focused on the sites and approved conditions under which Stanford School of Medicine faculty can practice medicine. However, technology is rapidly changing the practice of medicine, and I asked Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs and Interim Chief Medical Officer at SHC, and Ann James, Senior University Counsel for Stanford University, to provide an update on how faculty can engage with on-line medical consultations. Here are their comments:

With the almost daily discussion of medical information being shared (sometimes appropriately, sometimes not) on Twitter, Facebook, e-mail, blogs and other forms of social media, it is hardly surprising that entrepreneurs are working to develop increasingly more sophisticated systems for communicating medical information online. Several companies are focused on the access for individuals to specialists for a second opinion at a fixed cost. The participation on such panels is attractive to many specialists, including our own faculty, but there are specific reasons why such participation is not permitted. Obviously one of our most valuable assets as an organization is the intellectual capital of our faculty and we cannot surrender it to external commercial entities.

The rules around this are designed to protect the School and two hospitals. Each clinician who is providing patient care services as part of their employment at Stanford is covered by the **Practice Policy for the Physicians and Psychologists in the School of Medicine**

(<http://med.stanford.edu/academicaffairs/documents/rules-of-practice.pdf>). **All income from direct, indirect or consultative patient care services is part of practice income, which every practitioner assigns to either SHC or LPCH upon joining Stanford. There are specific and limited exceptions, which do not include such second opinion services. *Anyone seeking an exception must have the exception reviewed and approved in writing by the relevant Chair and Division Chief, and the Senior Associate Dean for Academic Affairs. Anyone who has a question about a specific arrangement can seek resolution with the Senior Associate Dean for Academic Affairs. And, SUMIT does not provide malpractice coverage for anyone who receives payment for patient care services outside the scope of the practice policy, thus placing anyone who does so participate at personal risk.***

The policy also addresses the specific situation of contact through the Internet, and provides a disclaimer for an answer if deemed appropriate.

We do recognize that this area of interaction is rapidly changing, and the School, in collaboration with LPH and SHC, is actively working to develop a Stanford Medicine brand and online presence. As this new area of patient interaction develops and is launched, we will make sure faculty can fully participate, and do so in a compliant manner. In the interim, please remember the importance of privacy for personal health information, use social media appropriately--and if you have questions, please contact Dr. Norm Rizk (nrizk@stanford.edu) or Dr. David Stevenson (dstevenson@stanford.edu). There will be much more on these issues to come.

Progress on a Proposed Late Career Practitioner Policy

In 2007 I appointed a Senior Transitions Task Force and asked Dr. Gary Schoolnik, Professor of Medicine, to serve as chair of the group (http://deansnewsletter.stanford.edu/archive/07_09_07.html#7). After over a year of data gathering and deliberations, the Task Force presented a set of recommendations to the School of Medicine Executive Committee (see power point presentations at: <http://med.stanford.edu/academicaffairs/senior-faculty/task-force.html>). Among them was the recommendation that a web site be developed that collected on one site School and University information, resources and assistance to faculty who are transitioning in their careers or moving toward retirement (see: <http://med.stanford.edu/academicaffairs/senior-faculty/>).

I can now personally resonate with senior transitions – being both a “senior” and someone who will be transitioning over the next year or so. Each stage of our careers offers new opportunities – some more engaging and exciting than others – but each benefits from some planning and discussion with friends, colleagues and advisors. Given the number of “baby boomers” who will join the ranks of seniors over 65 years of age, as well the increase in longevity in the US and globally, we face numerous challenges as individuals and as communities – both local and global – as was highlighted in a 2008 issue of Stanford Medicine that was devoted to ***“The Long of It: The World Turns Gray”*** (<http://stanmed.stanford.edu/2008spring/>). These demographic changes pose challenges to our medical community as health care providers and eventually for all of us as healthcare recipients (http://deansnewsletter.stanford.edu/archive/04_21_08.html#1).

As we age as physicians (or in any career path) it is important to be cognizant of our proficiency and skills, which will inevitably change for each of us, although the patterns and timing of change will vary in individual ways. While individual variation is likely, for those in some professions, such as commercial airline pilots, mandatory retirement takes place at age 65 (<http://www.leftseat.com/age60.htm>). While the work scope and responsibilities are clearly different for doctors compared to commercial pilots, medicine is also a life-and-death profession. However, there are no similar mandatory age limits to medical practice. Given the wide range of roles and responsibilities of physicians, which can include incredibly complex and intricate technical proficiency and the need for significant cognitive recall and reasoning, it seems reasonable for each of us to reflect on when – or if – it is time to transition from some or all of our clinical practice responsibilities.

Currently, including at Stanford, this transition decision is an individual one, although it is coupled with certification by local medical boards and credentialing committees. Certainly each of us will want to make a decision to retire from medical practice when we believe “the time is right” and especially when there is a concern about patient safety. However, I would quickly add

that the boundaries around such decisions could become blurry. We also want career transitions to occur at a time that is respectful of the dignity and well-being of the individual physician and, ideally, that avoids having such a decision imposed. Given our ever-increasing longevity, the coming dramatic increase in Americans who will cross the age-threshold to 65 years and older (I am one of them), it is not surprising that many physicians wish to continue meaningful work and contributions beyond age 65. Also, the current economic conditions may lead individuals to work longer into their senior years than they might have previously forecast or anticipated. Thus, it seems prudent to address planning for late career physicians in a thoughtful and proactive manner that is respectful to individual physicians and to the communities they serve.

Current estimates are that 20% of physicians nationwide are greater than 65 years old. While longitudinal data on physicians specifically are limited, it is clear that virtually all aspects of measurable cognitive functions (including inductive reasoning, spatial orientation, perceptual speed, numeric ability, verbal memory) decline after the age of 60 – a pattern that continues thereafter. While it might be argued that the pattern or rate of cognitive decline might be less steep or even more delayed in physicians, this would be a generalization that assumes that doctors have a different aging process than the general population – which is not likely. Moreover, it has already been reported that surgical complications occur at a higher frequency when performed by physicians older than 60 years of age and that medical boards tended to more frequently discipline physicians who were 40 or more years since graduation from medical school compared to those who were 10 or less years post training (6.6% versus 1.3%).

With this in mind, I appointed a Task Force in April 2011 to determine whether Stanford should develop a more formal policy for late career physicians and if so, how it should be formulated and implemented. Just as this Task Force was beginning its work, it was learned that the Medical Staff at Lucile Packard Children's Hospital (LPCH), under the chair of its President, Dr. Janesta Noland, was pursuing a policy in this area that was based on one prepared for several community-based children's hospitals. Given the integration of our faculty between LPCH and Stanford Hospital & Clinics (SHC) we agreed to work toward a shared policy that could be approved by the Medical Staff of each hospital (SHC and LPCH). The Task Force consisted of a multidisciplinary group that included:

- **Dr. Ann Weinacker**, Chief of Staff at SHC and Professor of Medicine, Chair of the Task Force
- *Dr. Kathy Gillam*, Senior Advisor to the Dean, Staff to the Task Force
- *Dr. Brian Bohman*, Associate Medical Officer and former Chief of Staff at SHC
- *Dr. Karl Blume*, Professor of Medicine Emeritus
- *Dr. Rusty Hoffman*, Chief of Interventional Radiology and Associate Professor of Radiology
- *Dr. Rob Jackler*, Sewall Professor and Chair, Department of Otolaryngology: Head and Neck Surgery
- *Dr. Ann James*, General Counsel
- *Dr. Tom Krummel*, Emile Holman Professor and Chair, Department of Surgery
- *Dr. Frank Longo*, George E and Lucy Becker Professor and Chair, Department of Neurology
- *Dr. James Mark*, Johnson and Johnson Professor of Surgery, Emeritus
- *Dr. Janesta Noland*, Chair, Medical Staff at LPCH and Adjunct Assistant Professor of Pediatrics

- *Dr. Kathy Renschler*, Community Physician and former Member, Board of Directors, SHC
- *Dr. Norm Rizk*, Senior Associate Dean for Clinical Affairs and Berthold and Belle N. Guggenheimer Professor of Medicine; Interim Chief Medical Officer at SHC
- *Dr. Gary Schoonik*, Professor of Medicine and of Microbiology and Immunology
- *Dr. Penelope Zeifert*, Clinical Associate Professor of Neurology

The Task Force reviewed all available literature and examined related policies that have been developed to date at other hospitals and institutions. It determined that Stanford should take a lead in developing a formal policy for late career physicians that provided guidance and credentialing oversight regarding their medical practice. A draft policy, which was intended to apply to all members of the Medical Staffs of both LPCH and SHC, was reviewed and approved by the leadership of the School of Medicine in November 2011. The Medical Executive Committee of the SHC Medical Board reviewed the policy on Wednesday, March 7th. It received conceptual approval with the expectation that the final policy would be implemented once all the details were refined. The policy is currently under review within the LPCH Medical Staff.

Having decided that a policy should be put into place, the Task Force and Medical Staff review committees had considerable discussion about what the age threshold should be. It is also important to note that this policy does not preclude the need to be attentive to younger physicians about whom concerns for fitness of duty are raised and who would need to be considered on an individual basis through the Credentials Committee. The most appropriate age for beginning mandatory routine examination of late stage physicians is not fully defined by existing data, and the Task Force determined that they would begin with physicians aged 75 and older. This decision was partly influenced by the fact that Alzheimer's disease, the most common cognitive disease of aging, is more likely to occur in individuals aged 75 and older. At this time only a minority of the active medical staff are age 75 or older— although this number will likely increase given the reasons mentioned above. The Task Force also recognized that the age criterion could be changed in time as experience and data on the use of the policy accrued – making this more of a pilot policy at this juncture.

With all this in mind, the **SUMC Late Career Practitioner Policy**, assuming final approvals, will apply to all members of, and applicants to, the medical staffs of SHC and LPCH who are 74.5 years of age and older. For these practitioners, medical staff credentialing privileges (not employment) will be based on a peer assessment of clinical performance, a physical examination and cognitive screening. These evaluations must indicate that the practitioner has no detected physical or cognitive problem that might interfere with the safe and effective provision of care under his or her current privileges (for current members of the medical staff) or those being requested by new applicants to the medical staff. As currently conceptually envisioned:

- **Three qualified members of the medical staff members will perform a peer-assessment of the practitioner or applicant. The Stanford University School of Medicine Clinical Excellence Core Competency Evaluation will be used for this purpose.**
- **A complete history and physical assessment by an approved physician examiner.**
- **A cognitive screening will be performed by an approved examiner**

The review and examinations would be carried out with strict confidentiality, and the outcomes would serve to guide the credentialing process and well as the scope and duration of clinical privileges. For physicians aged 75 and older, this three-part evaluation would take place every two years. The date that this policy will go into effect remains to be determined but, assuming final approvals, it will be in the 2012 calendar year.

The Task Force and the Medical Executive Committees recognize that adopting this policy opens a number of questions and would set a standard that is not part of medical credentialing at most institutions across the United States. Developing this policy was undertaken with concern for patients who seek medical care at SUMC and for physicians who practice on our medical staff.

I want to thank the members of the Task Force and, in particular the leadership of Dr. Ann Weinacker along with the outstanding support of Dr. Kathy Gillam, for their thoughtful and comprehensive review of this important and challenging issue and recommendations they have brought forth. I also want to thank Dr. Janesta Noland for her leadership at LPCH and for the collaboration of the Medical Staff leadership at SUMC, both that of LPCH and of SHC. The date of implementation of an approved policy will be announced in a subsequent newsletter.

More Discussions About Bicycle Safety On Campus

I have written all too frequently about bicycle safety on campus and my concerns for those in our community of students, faculty and staff who take personal risk by not wearing bike helmets, or who engage in other unsafe behaviors, or who endanger others by not obeying traffic safety rules. In fact, for what it's worth, I have contributed nearly 20 articles and pleas about bike safety in the Dean's Newsletter alone over the past decade. In part this is because there are hundreds of bike collisions (involving bikes, cars and pedestrians) each year and because a number of these collisions result in serious injury (including head trauma, fractures, etc). There are now more than 13,000 bicyclists on campus each day. This is good news since it means that car trips are being reduced as a source of campus transportation.

At the same time virtually everyone I have spoken with reports personally observing unsafe riding behavior by faculty, students and staff. It's not just the absence of bike helmets that is of concern. Increasingly cyclists are "multi-tasking" – including talking on cell phones, texting, eating or drinking – sometimes engaging in more than one of these unsafe behaviors at the same time. Equally worrisome is the lack of attention to traffic laws – not stopping at stop signs, failing to yield when making turns, driving at unsafe speeds and, especially concerning, not using any lights or reflective gear when riding at night – including on the public roads on the campus. While obviously subject to sample bias, every night when I drive from the medical school to my residence on campus, I make it a habit to count the number of bikers who wear helmets or who have lights or obey safety laws. Unfortunately that number has **not** changed over nearly a decade – and is still about 1 in 10 riders. Interestingly, similar informal "personal surveys" by others come amazingly close to my tallies.

The unsafe cycling practice on campus is not just by students – it is also carried out by faculty and staff. And it occurs at the medical school – where one would like to think there would be a higher awareness and attention to personal safety. After all, a serious fall and injury can be life and career changing.

Amazingly, unsafe bicycle safety continues despite enormous – even heroic – efforts by the University Bicycle Safety Program (http://transportation.stanford.edu/alt_transportation/BikingAtStanford.shtml). Over a number of years significant efforts have been undertaken in education, engineering, encouragement and enforcement. The importance of bike safety is part of the orientation of incoming Stanford students – and which results in 85% of freshman students learning about bike safety and literally thousands of free bike lights being given to students each year. Safety classes abound, competition (with prizes) to foster greater bike safety between undergraduate dorms are popular - but without a sustaining impact on helmet and light use or attention to traffic rules. In fact, while nearly all students admit they have learned something new from bicycle safety classes, few actually practice the lessons in their daily riding activities. Over the past years the University has put efforts into creating safer bike circulation routes on campus and has tried to make the campus as friendly as possible to bikers. In fact, Stanford has been designated the first and only Platinum Level Bicycle Friendly University by the League of American Bicyclists through 2012. But bicycle “friendly” is not the same as “bicycle safe.” Unfortunately, not paying attention to safety rules also occurs despite increased efforts by the Stanford Public Safety (aka the police) to enforce safety and traffic rules.

How about bike safety among our medical school students? I reported in the August 29th DNL (http://transportation.stanford.edu/alt_transportation/BikingAtStanford.shtml) that three of our SMS 2 students, Anthony Kaveh, Sneha Shrestha and Nancy Yerkes, worked collaboratively with Ariadne Scott, Stanford’s Bicycle Safety Coordinator, to promote the use of helmets and lights by all incoming MD students in 2011 (also see: http://deansnewsletter.stanford.edu/archive/05_09_11.html#10). As part of this program every medical student was given a helmet, bike light and safety instructions. All signed a pledge to wear the helmet and use the light. You might ask, what has happened as a result of these good deeds and intentions? A student sponsored and led survey was sent to each of these same medical students in January 2012 – just 4 months after the orientation program and student safety affirmation noted above. The survey had a 100% response rate but observed that 57% of the first year medical students reported that they “always” wore a helmet and 49% said that they “always” used bike lights at night. While it is true that an additional number of students indicated that they “almost always” used helmets or lights, the “always” percentage is really the important metric. Based on other experiences, even these results are likely to deteriorate over time.

Clearly we need to do more to achieve bicycle safety at Stanford. Surely more education helps, but we also need to work collaboratively to ensure that there is greater compliance and enforcement with safety to traffic rules, lights, helmets and safe riding habits. We all need to be advocates for safety and to take note when our colleagues and friends are being unsafe – and whenever possible provide counseling and more. I would hope that the medical school community could play more of a leadership role in modeling bicycle safety. We would all hate to see bike safety come to heightened attention because of a serious injury to one of our students, co-workers, friends or colleagues.

Seed Grants Promote Innovation and Interdisciplinary Research

Over the past decade both the Medical School and University as a whole have developed a number of programs that provide competitive seed grants to faculty who are addressing new research themes, especially if they are interdisciplinary and/or create bridges between basic and clinical faculty (http://deansnewsletter.stanford.edu/archive/09_26_11.html#3; http://deansnewsletter.stanford.edu/archive/11_23_09.html#3). The School of Medicine seed grant programs, which are based largely in our Institutes of Medicine, Strategic Centers and Spectrum, share in common their support for novel and innovative research and the prospect for bringing new teams of faculty together to engage in research that might not otherwise have happened. Some, especially in recent years, have focused on seed grants to junior faculty. In addition, Bio-X has a significant seed grant program, as does the Beckman Center for Molecular and Genetic Medicine, the Children's Health Research Institute and the Stanford-Coulter Translational Research Grants Program, among others.

Over the past 5 years the School of Medicine has allocated over \$15 million to Institutes and Centers for seed grant programs. Most all of the grants are modest in size but nearly all have an important and significant leveraging impact. A total of 220 seed grants have been awarded over the past 5 years, and, to date, 140 publications and 81 successful follow-on funding proposals have resulted. While it is hard to say with certainty that the seed grants accounted for successful competition for larger sponsored research awards, there seems little doubt that they have created a greater climate of collaboration, interaction and innovation throughout the Stanford community. These funds are best viewed as an investment in the future of our research mission, from basic research through translational to clinical research, and I encourage faculty to apply for them. The School's Research Management Group maintains an extensive list of seed grant opportunities (<http://med.stanford.edu/rmg/funding/internalfunding.html>) for this purpose and I hope you will take advantage of the information available there.

Baxter Foundation Visits Stanford for the 52nd Time

Just a year after the School of Medicine was relocated from San Francisco to Palo Alto in 1959, the Baxter Foundation began making investments in Stanford to support medical and graduate student education, faculty scholar awards and capital support. The Foundation was established in 1959 by Delia Baxter in memory of her husband, Donald, a distinguished physician, engineer, and scientist who pioneered the commercial formulation of intravenous solutions based on his experiences as an Army doctor during World War I. The Baxter Foundation has no ties to the company and is committed to making annual gifts to selected medical research and education initiatives and institutions.

Stanford has been one of the longest beneficiaries of these gifts. The trustees of the foundation, Don Haake, Dick and Martha Haake, and Jim and Jane Russell, have not only been responsible for the annual gift decisions but have been personally invested in the students and faculty receiving the awards. Indeed, over the years they have spent time visiting with potential recipients, learning about the work being conducted and making the Baxter Foundation personally meaningful to each of its annual awardees.

This year the Foundation also celebrated the 10th Anniversary of the Donald E. and Delia B. Baxter Foundation Laboratory in Stem Cell Biology, which was established in 2002 and which has been ably led by Dr. Helen Blau, who is also the Donald E. and Delia B. Baxter Foundation Professor at Stanford. Based on the comments of Don Haake, who spoke for the Foundation at a ceremony in the Lorry Lokey Stem Cell Research Building, the Foundation is deeply

appreciative and admiring of the work that has been done over the past decade in the Baxter Lab and also of the many students and faculty the Foundation has supported over the past 52 consecutive years. This is quite an incredible partnership for which we are deeply appreciative.

Upcoming Events

The Department of Chemical and Systems Biology, through its Sterling Visiting Professorship Program, cordially invites you to attend two lectures by Alyson Shotz, this year's visiting artist from March 26-30, 2012. These lectures are free and open to the public.

Alyson Shotz is an artist whose work frequently intersects art and science. She has exhibited around the world and her work is in the collections of many museums including the Solomon R. Guggenheim Museum, the Museum of Modern Art, San Francisco and The Hirshhorn Museum, among others.

During her residence, Ms. Shotz plans to investigate the relationship between empirical research, observation and experimentation in art and science as a means to new discoveries. The students will join her in producing a series of experiments in hot glass and microscopic photography.

For more info on the artist's background please visit:

http://www.derekeller.com/alysonshotz_work.html

Monday, March 26 at 11:00am

“The Ethereal Invisible: an Overview of the Artists work“

Munzer Auditorium

Friday, March 30 at 2:30pm

“Looking for Undiscovered Realities: Finding and/or Failing, followed by a presentation of the student collaboration”

Munzer Auditorium

The Friday lecture will be followed with a reception in CCSR (outside 3130) at 4:00pm.

For more info on the artist's background please visit:

http://www.derekeller.com/alysonshotz_work.html

If you have questions or need more information, please contact Stuart L. Jeung @650.736.2999 or stuartj7@stanford.edu

Awards and Honors

The recipients of the 2011 School of Medicine SPIRIT Award and the Inspiring Change Award were recently announced and will be formally celebrated (along with our valued staff) at the Dean's Staff Recognition Program celebration on Thursday, March 29, 2012 in the Li Ka Shing Center for Learning and Knowledge from 4:00-6:30 p.m. This year the SPIRIT Award recipients include:

- **Ross Colvin**, Department of Neurosciences-IDP
- **Kerry Garcia**, Department of Obstetrics/Gynecology

The winner of the Inspiring Change Leadership Award is:

- **Felicia Gentile**, Department of Comparative Medicine/Veterinary Service Center

Congratulations to each of these winners!!

Dean's Newsletter

April 9, 2012

Investment in Science is Great for the Future and for the Economy

There should be no question that investments in basic science research are among the most important and impactful that a nation can make. For example, the investments made over the past 50-60 years, largely by the National Institutes of Health (NIH) and other federal agencies, have made the US the world leader in the life sciences. Unfortunately, that investment is now at risk due in large part to the flat funding by the NIH over the past several years, which has resulted in decreased purchasing power for investigators. It is further compromised by the somewhat confusing message that the NIH leadership projects about its investment, saying on the one hand that it values basic research and on the other (often more loudly and persistently) that it seeks to overcome limitations in drug development by making NCATS (the recently formed National Center for Translational Sciences) its highest priority.

Of course, the connections between basic science and clinical and translational research, in all of its many dimensions, are essential for our future as a nation. But the mission of the NIH should focus on research and not become deflected – directly or by implication – to an attempt to overcome the deficiencies of the drug pipeline, which is the responsibility of industry. Rather, the NIH and our nation should make clear that drug development should be an industry expectation and priority – it is, after all, their business model. Suggesting or implying that the NIH will take a leading role in bringing new drugs to patients could confuse the public as well as NIH's congressional constituency, with potentially inadvertent consequences. This was a message I conveyed in a recent op-ed piece entitled “*Budget Super Committee's Failure Puts Medical Research at Risk*” (see: http://deansnewsletter.stanford.edu/archive/02_20_12.html#4).

The case for support for basic science research by the NIH was recently eloquently made by Dr. Suzanne Pfeffer, Professor of Biochemistry, who testified before the US House of Representatives Subcommittee of Labor, Health and Human Services of the Committee on Appropriations, in her capacity as President of the American Society of Biochemistry and Molecular Biology (ASBMB). In her testimony Professor Pfeffer presented illustrations of the incredible progress that has been accomplished in science and medicine over the past decades but also commented that “*Unfortunately, in the decade since these aforementioned funding increases, Congress has funded the NIH at essentially flat levels. Consequently, the purchasing power of these funds has significantly decreased relative to the biomedical research and development price index (BRDPI) - the industry's standard measurement for inflation. As members of this subcommittee heard from the NIH Director during last week's NIH appropriations hearing, the prices for equipment, supplies and staff have increased by 18% over*

the past decade. In constant dollars, the FY 2012 budget and the President's proposal for FY 2013 are \$4 billion lower than the peak year (FY 2003) and at the lowest level since FY 2001. The number of research project grants funded by NIH has declined every year since 2004. This decline is projected to continue in FY 2013 and beyond, when NIH will fund 3,100 fewer grants than in FY 2004. In FY2010, NIH made 8,765 new and competing renewal awards, 1,600 fewer than in FY 2003. Success rates have fallen more than 14 percentage points in the past decade and are projected to decline even further in FY 2012 and 2013. The NIH's investment in basic research has suffered as well.

When setting budgetary priorities, it is important to remember that technological innovation will be a key component for our future economic security and international competitiveness. More than 80% of the investment this Congress makes in the NIH leaves the Bethesda campus and funds academic researchers across the country. Each NIH grant – on average – supports approximately seven high-tech, high-paying jobs. These are precisely the type of jobs each member of this committee would want to have in their own district. These are also the kind of jobs that contribute to a 21st century, technology and information- based economy. Additionally, analysis of the economic impact of your NIH investments indicates that for every \$1 invested in the NIH, the economy derives a \$2 return. Finally, investment in research will continue to modernize our nation's research laboratories and facilities, spur innovation, and provide an immediate boost in employment for our nation's workforce."

The economic impact of biomedical research is clear and well documented in a number of sources, including a May 2011 report from United for Medical Research entitled "*An Economic Engine: NIH, Research, Employment, and the Future of the Medical Innovation Sector*" (see: http://deansnewsletter.stanford.edu/archive/08_29_11.html#5 and http://deansnewsletter.stanford.edu/archive/11_15_11.html#1). A recent update from United for Medical Research observed that, based on Department of Commerce 2011 data, NIH invested \$23.7 billion in extramural support to 50 states (down from the 2010 level of \$26.6 billion, which contained ARRA support). This support directly and indirectly supported 432,094 jobs. Notably, in California alone this funding created 63,196 new jobs. Clearly, whether measured by the creation of new knowledge, translation of new discoveries, or creation of new jobs and stimulation of the economy, investments in NIH and sponsored research are meritorious and important for our communities and our nation. We need the NIH to remain focused on its primary mission.

2012 Employee Recognition: Our Staff Make Stanford Great

I suspect that we have all had a similar experience. You pass someone in the hall or on a walkway, perhaps wave a greeting, but you know little about the individual with whom you just made contact. Just a gesture of friendliness in our Stanford community. Or, you make a judgment, sometimes admittedly stereotyping, about the life experience of someone who has followed a different career path – becoming an administrator or a laboratory technician or a grants manager or any of the hundreds of positions that comprise a complex institution like Stanford School of Medicine. What amazes me is how superficial one's assumptions can sometimes be and how much richness, depth and knowledge one finds in individuals when we get better acquainted with those who have pursued different career paths. That is one of the reasons why I find the Employee Recognition Program so valuable and important. Each year (and as a consequence many times in the intervening days, weeks and months) I am amazed by the extraordinary range of knowledge, skills and experiences that our outstanding staff provide to Stanford Medicine.

In 2011, the School of Medicine had 2707 non-academic staff members, of which 2416 were in full-time positions, from administration to communications to facilities to healthcare services to human resources to information technology services to research to student services and many more. It turns out that the composition of our staff is largely women (2019 of the 2707) and that the average years of service number 7.7 years. Our staff works in basic and clinical science departments, institutes and centers and central administrative units. Together they contribute enormously and deeply to our missions in education, research, patient care, community service and beyond. Staff provides the foundation of what makes Stanford such a great institution - offering long-term stability, intellectual contributions and dedication to all that we do and have accomplished. While faculty and students are featured in the public arena for their exceptional contributions and discoveries – each well deserved – almost none of these successes would have been possible without the thoughtful contributions of staff members in research laboratories, classrooms, clinical settings and in the countless array of positions that comprise what we affectionately call a “research intensive academic medical center.”

On March 29th we had the opportunity to thank staff who have worked at the School of Medicine (or elsewhere at the University) for five or more years – including six individuals who have been with Stanford for 35 years. As we have done over the past couple of years, an “Employee Recognition” website has been constructed to feature all of our staff celebrating an anniversary year of employment (from 5 to 35 years) as well as the Spirit and Inspiring Change Leadership Awards (see: <http://med.stanford.edu/employeeerecognition/>). I was deeply impressed by the experiences and contributions of staff who have been part of Stanford for the past three and more decades and, in particular, by the important roles each has played in the institutional excellence we share and celebrate today. The six staff members celebrating their 35th Anniversary are highlighted on the website. They are:

Barbara Meehan, Stanford Blood Center
Wayne Moore, Herzenberg Lab, Department of Genetics
Hung Pham, Laboratory Manager (currently for the James Chang lab)
Diane Rapacchietta, Department of Radiation Oncology
Sergio Raygoza, Veterinary Service Center
Yin-Gail Yee, Division of Nephrology, Department of Medicine

I also want to thank and acknowledge each of our staff – and especially those who have been part of the Stanford Medicine community **for 25 or more years**. Our appreciation and gratitude is deeply felt to all but I list here those with 25 years of employee service to Stanford:

Ruth Burns, Department of Comparative Medicine
Phyllis Bussey, Department of Medicine/Oncology
Debra Czerwinski, Department of Medicine, Oncology
Mayling Dixon, Department of Pathology
Madelleine Garcia, Department of Neurology
Anne Gordon, Department of Microbiology & Immunology
Debra Hiraki, Department of Pathology/Blood Center
Diana Laurent, Department of Medicine and Immunology & Rheumatology
Ellen Lewanda, Department of Obstetrics & Gynecology
Pauline Luu, Department of Psychiatry

Abera Metaferia, Department of Educational Programs and Services
Siv Modler, Department of Pediatrics
Christine Scholberg, Department of Medicine/ Prevention Research Center
Sheila Siegel, Department of Medicine/Family & Community Medicine
Patty Winningham, Department of Pathology
Margaret Wootton, Department of Medicine

In addition I want to offer congratulations to our employees with 30 years of service:

Pamela Bernstein, Department of Dermatology
Susan Bryson, Department of Psychiatry
Marita Grudzen, Department of Medicine, Family & Community Medicine
Joan Heberg, Department of Genetics
Robin Holbrook, Department of Microbiology & Immunology
Mahmonir Keyhan, Department of Microbiology & Immunology
Nancy Lennartsson, Department of Medicine/Biomedical informatics Research
Margaret Malone, Department of Communications & Public Affairs
Karen Mulkey, Department of Research Management Group
David O'Brien, Department of Institutional Planning
David Parks, Department of Genetics
William Roden, Department of Informational Resources & Technology
Georgette Stratos, Department of Medicine
James Taskett, Department of Visual Art Services
Eva Vasquez, Department of Educational Programs and Services
Claudia Weber, Department of Genetics

At Employee Recognition event we also had the opportunity to acknowledge the recipients of the **School of Medicine Spirit Award**. This is the 12th year this award has been given. Each year it has recognized two individuals who give evidence of consistent dedication, initiative, motivation, a positive attitude and exemplary service, support and interactions. This year's Spirit Award winners are (see also <http://med.stanford.edu/employeeRecognition/awards/2011-spirit.html>)

Ross Colvin, Program Administrator, Neurosciences Interdisciplinary Program
Kerry Garcia, Administrative Assistant, Department of Obstetrics-Gynecology.

We also had the opportunity the **School of Medicine Inspiring Leadership Award** (see: <http://med.stanford.edu/employeeRecognition/awards/2011-inspiring-change-leadership.html>)
The 2011 recipient is:

Felicia Gentile, Project Manager, Department of Comparative Medicine- Veterinary Service Center

Please join me in congratulating our award winners and also our staff employees who contribute, each day, to making Stanford such an extraordinary institution. I have been deeply honored to get to meet so many wonderful staff during my tenure as dean and have deep respect for their wonderful contributions.

Medical Education: Change is in the Wind

Changes and sometimes “relative” revolutions (albeit really more gradual evolutions) in medical education are commonplace and are really part of an ongoing process – but they are also steeped in tradition and, at times, limited in their creativity by certification requirements and accreditation bodies. In many ways medical education is not a seamless process but a loosely interconnected array of education and training experiences that begins with premedical requirements - a number of which have quite limited relevance to medical education and can be quite limiting in making opportunities available to students to explore when they are in college. (We are considering doing something significant about these.)

College is followed by medical school, which traditionally follows two minimally connected components affectionately referred to as preclinical and clinical, each two years long and both relatively unchanged, at least conceptually, in more than a century. The Liaison Committee on Medical Education (the LCME) oversees all aspects of medical school education programs. Stanford had its last LCME review in 2005 and is beginning preparations for its next major review, which will occur in 2013 (see:

http://deansnewsletter.stanford.edu/archive/02_20_12.html#5). A separate oversight organization, the *Accreditation Council on Graduate Medical Education (ACGME)* and its specialty based *Residency Review Committees (RRC)* establish the criteria for training, accreditation of programs and certification of residents and fellows. Each program has proscribed lengths of training, required rotations, etc. In recent years we have witnessed some flexibility in RRC requirements, including at Stanford, where residency programs in cardiovascular surgery, vascular surgery and others have changed thanks to the vision and endurance of their leaders.

Still, the end result is a quite long duration of education and training – the merits of which (including each component) have advocates and detractors. A number of individuals, organizations and institutions have advocated for better alignment among the premedical, undergraduate medical and graduate medical components of medical education – focusing on ways of reducing the overall duration and better integrating its various components. This was one of the major themes that emerged from our Think Tank on Transforming Medical Education that we held in August 2010 (see: http://deansnewsletter.stanford.edu/archive/09_13_10.html#1) and that was further discussed at our Annual Strategic Planning Leadership Retreats in 2011 (see: http://deansnewsletter.stanford.edu/archive/01_24_11.html#1) and 2012 (see: http://deansnewsletter.stanford.edu/archive/01_30_12.html#4). The prospects for shortening the duration of medical training from 14 to 10 years was also recently covered in an interesting Viewpoint article by Zeke Emmanuel and Victor Fuchs in the March 21st issue of the *Journal of the American Medical Association* (see: <http://jama.ama-assn.org.laneproxy.stanford.edu/content/307/11/1143.full.pdf+html>).

In his annual address to the Medical School Senate on March 21st, Dr. Charles Prober, Senior Associate Dean for Medical Education and Professor of Pediatrics, reviewed the ongoing progress in further revising our current medical student curriculum. The last major revision of our MD curriculum began in 2003 (see: http://deansnewsletter.stanford.edu/archive/09_02_03.html), and it has shaped the education and training of a generation of Stanford Medical Students. While many schools certainly make this claim, I think that it is true that Stanford’s approach to medical education is unique in that it

fosters scholarship and research in tandem with the foundations in preclinical and clinical education. In fact, nearly 70% of Stanford medical students take 5 or more years to graduate – although nearly all do so with a rich and deep experience in Scholarly Concentrations, Med Scholars or combined degree programs. Of course this lengthens the duration of training and does raise the important question of where economies of scale might be achieved.

With this question in mind as well as a clear goal of developing education modalities that are more suitable and appropriate for the learners of today and tomorrow, Dr. Prober and his colleagues are addressing a series of themes to further “revolutionize” medical education. The overarching guiding principle is to produce graduates who are outstanding clinicians, physician scholars and future leaders in medicine. One of the themes being pursued is making education milestones competency-based, in tandem with defining the fundamental knowledge and skills that would allow students and learners to then differentiate along variegated pathways. A major goal is to use and refine emerging learning technologies, which will likely reduce or even eliminate lectures while promoting more interactive learning environments in science, in clinical medicine and in their integration.

Hopefully these new tools, technologies and interactive learning environments will blur the lines between college, undergraduate and graduate medical education. They should also promote early differentiation, since our goal is to produce students with unique skills and knowledge – and to avoid developing a single program or, worse, creating a “trade school mentality.” Quite the opposite: it is important that science, innovation, discovery and evidence-based analytic thinking serve as the underpinnings for our medical students – and that this approach continue into graduate, post graduate and continuing life learning.

The case for change in medical education cannot simply be about its duration or in developing a standard approach to teaching and learning. For Stanford it must be about educating and training physicians who will be truly transformative in science and clinical medicine as well as in a wide spectrum of career paths. That does require time – but it also requires a careful examination of how to more effectively coordinate and integrate education across the continuum of knowledge acquisition. I fully expect that we will be leaders in this important quest.

Continuing Medical Education: The Funding Profile Continues to Change

On October 1, 2006 we published the *Policy and Guidelines for Interactions between the Stanford University School of Medicine, the Stanford Hospital and Clinics, and Lucile Packard Children's Hospital with the Pharmaceutical, Biotech, Medical Device, and Hospital and Research Equipment and Supplies Industries ("Industry")* (see <http://med.stanford.edu/coi/siip/policy.html>). This policy, which was revised most recently on July 22, 2010, has had a major impact on our education and clinical care programs at Stanford and has helped to shape the impact of industry marketing on the education of students and trainees across the US. It cast a bright light on the difference between faculty engagements with industry for the purpose of promoting research (which we strongly endorse) and faculty participation, knowingly or unwittingly, in marketing for industry (which we do not permit). With this policy Stanford was an early leader in what has become a transformation in eliminating gifts, meals and financial influence on our medical community for teaching as well as clinical practice.

Whereas industry once spent nearly \$20 billion annually on marketing to doctors and hospitals, and while a very large majority of physicians in practice or on the faculty of academic medical centers have admitted receiving industry gifts and inducements, in recent years the situation has changed dramatically – at least at medical schools such as Stanford and many others across the US. The public scrutiny of the not infrequent damaging news reports about large industry payments to physicians has had other consequences. For instance, the Physician Sunshine Act, which mandates that all industry report payments to doctors annually on publicly searchable databases, was included in the Affordable Care Act of March 2010. Even before that, faculty at a number of major medical schools, including Stanford, began reporting their financial relationships with industry to their institutions (see <http://med.stanford.edu/coi/>) and, at Stanford, in the public domain in Community Academic Profiles (CAP) system– (see: <http://med.stanford.edu/profiles/>).

These policies appear to be having an impact, as seen in a reduction in industry’s “drug rep” sales force and even a decrease in expenditures on “free drug samples” (really a marketing strategy) from \$8.4 billion in 2007 to \$6.3 billion in 2011. There are a variety of complex interrelated factors contributing to these changes, including the financial challenges many pharmaceutical industries are experiencing, the fact that many blockbuster drugs are now going off patent and a changing culture inside the pharmaceutical industry. Overall this is some progress – to which we contributed.

In September 2008 Stanford introduced new policies on industry support for Continuing Medical Education or CME (see: <http://cme.stanford.edu/policies/commercialsupport.html>), and once again we were a national leader and pacesetter in the important area of industry interactions. While limiting gifts, meals and financial inducements from industry was embraced by faculty and students, the restrictions on how industry support could be received and used for CME was more contentious – although they are now very much a part of accepted practice at Stanford. This is not necessarily the case at peer institutions, where rules regarding CME are still quite lax. That said, industry support for CME is also changing, as reported recently in a Perspective article by Michael Steinman, Seth Landefeld and Robert Baron in the March 22nd New England Journal of Medicine (see: <http://www.nejm.org/doi/full/10.1056/NEJMp1114776>) entitled “*Industry Support of CME – Are We at the Tipping Point.*”

These authors note that industry support for CME grew significantly from 1998 to 2007, from \$301 million to \$1.2 billion per year, accounting for 59% of the revenues of CME providers (if advertising and exhibit payments are included). By 2008 (interestingly, the year Stanford’s policies on CME became official), industry support began to decline and by 2010 it had fallen 31% from its peak three years earlier. Again, there are many contributing factors – including institutional policies (which for CME include relatively few institutions) and moves away from resort hotels to academic institutions as venues for CME programs and courses (something we are increasingly doing at Stanford). Also, faculty are increasingly aware that participating in industry funded CME requires public reporting and, as a result, carries the risk of potential embarrassment.

At the same time, because marketing to doctors has proven so beneficial to industry (in drugs sales, changes in prescribing practice, use of devices) it is clear that other venues will be sought – including nonaccredited medical education venues and satellite symposia at professional meetings. The story is far from over, and it is important that we define the principles guiding

interaction with industry for education and training and also that we educate and guide our physicians, students and trainees. This will be a continuing education process in its own right. It is also plausible that new venues for education, including novel IT based systems, could disrupt traditional CME as we know it today into a whole new arena.

Indeed, the very model of learning at medical conferences is open to question, as was recently shown in a “Viewpoint” article by John Ioannidis, Director, Stanford Prevention Research Center and C. F. Rehnberg Professor in Disease Prevention in the School of Medicine and Professor of Health Research and Policy and, by courtesy, of Statistics in the April 4th issue of JAMA entitled “*Are Medical Conferences Useful? And for Whom?*” (see: <http://jama.ama-assn.org/content/307/12/1257.full.pdf+html>). Dr. Ioannidis offers provocative and appropriate questions about the benefits and costs of medical conferences, including the motivations of industry to fund many of them. He too notes that new and rapidly evolving information technologies can provide new venues for education that will be less expensive, more convenient and likely more informative. These are exciting possibilities, but they will likely occur more slowly than desired given the stakeholders and financial interests that are engaged. But change is inevitable – and Stanford has helped to catalyze some of the changes to improve the value of education and enhance the public trust in medicine as a profession.

Marching Toward the Launch of the Campaign for Stanford Medicine

I previously commented on the upcoming Campaign for Stanford Medicine, the first phase of which will be formally launched during the week of May 7th with the three events described below. This phase of the Campaign will last approximately two years. The second phase will be organized when a new dean arrives and has the opportunity to carry out an additional needs assessment for Stanford Medicine in collaboration with our colleagues at Stanford Hospital & Clinics. The launch events are as follows:

Monday, May 7: Campaign Launch Reception for donors, volunteers, and Stanford leadership to celebrate the official launch of the campaign and to announce a major fundraising goal. President John Hennessy will lead this event, along with Amir Dan Rubin, CEO of Stanford Hospital and Clinics, and myself. It will be held on the Alumni Green in front of the LKSC under a “big tent.”

Thursday, May 10: Partners in Medicine: a lecture and dinner that I will host along with Amir Rubin. We will be joined by Drs. Abraham Verghese and Beverly Mitchell for a panel discussion, moderated by Paul Costello, entitled *The Promise, the Hope, the Challenge: Creating the Future of Health Care*. Guests invited to this event include volunteers and donors to Stanford Medicine.

Saturday, May 12: Healing Matters: an open house from 8:00 am – 1:00 pm. This event will provide attendees an opportunity to learn about Stanford’s leadership in clinical care and to hear about the latest breakthroughs in biomedical research. After the opening plenary by Ron Johnson, Stanford Trustee and CEO of J. C. Penney, attendees will have the opportunity to go to breakout lectures or take walking tours of new buildings on the medical center campus, all presented by School of Medicine faculty. Amir Rubin and I will lead the closing plenary, *The Time Machine: Our Health Care in 2018*. Please see below for details.

Opening Plenary:

Stanford Medicine + You = Hope Ron Johnson will lead the opening plenary session and engage the audience in a joint exercise of imagining future health care for our community. In addition, we will show a video in which Amir Rubin and I share our vision for Stanford Medicine.

Breakout Session One:

Transforming 300 Billion Points of Data into Diagnostics, Therapeutics, and New Insights into Disease

Atul Butte, MD, PhD

The Coming Epidemic of Dementia and How It Can be Diagnosed, Treated, and Prevented

Frank Longo, MD, PhD

Breast Cancer in the Genomic Age

Mark Pegram, MD

Clinical Trials at Stanford: A Walking Tour of the Jill and John Freidenrich Center for Translational Research

Beverly Mitchell, MD

Breakout Session Two:

Movement Disorders and What Can Be Done About Them

Helen Bronte-Stewart, MD

Sensing and Diagnosing Cancer Before It Becomes a Disease

Sam Gambhir, MD, PhD

Can Stem Cells Be Used to Repair Damaged Hearts?

Robert C. Robbins, MD

The Stanford Women's Cancer Center: A Walking Tour of the New Facility at Blake Wilbur

Jonathan Berek, MD

Closing Plenary:

The Time Machine: Our Health Care in 2018. Amir Rubin and I will lead a discussion on what the patient can expect when visiting Stanford Hospital in 2018 and how Stanford is navigating the economic and political challenges of health care delivery with the promises of technology, genetics, and biomedical innovation. The presentation will also feature a virtual “fly-through” tour of the new hospital.

To attend Healing Matters or for more information please contact Kim Armstrong, karm@stanford.edu. I hope to see you there.

Upcoming Event: Medicine and the Muse 2012

I am very pleased to announce the upcoming annual Medicine and the Muse: An Arts, Humanities and Medicine Symposium. This is a highly regarded and much celebrated event that features wonderful presentations by leaders and artists – including our very talented students.

This year's Medicine and the Muse will be held on Wednesday April 11th beginning at 5:30pm in Berg Hall at the Li Ka Shing Center for Learning and Knowledge. The featured speaker will be Medical School alumna, Dr. Sherri Fink, who received an MD and PhD at Stanford and who is a celebrated Pulitzer Prize winning journalist in investigative reporting. Dr. Fink's presentation is entitled "*Reporting in an Emergency: The Complex Trauma Narrative in the Age of the Tweet.*"

In addition, this year's Medicine and the Muse will feature music, art and presentations by Stanford medical students. Also, the winners of the student Global Health Writing Contest will be announced at the event.

This event is free and open to the public. There will be a reception following the presentations to which you are invited. If you would like additional information please visit <http://bioethics.stanford.edu/arts/>

Educators-4-CARE Program

The Educators-4-CARE (E4C) program is now accepting applications for faculty positions. Introduced in 2008, the E4C program was established to enhance the development of medical students as skilled and compassionate physicians. E4C provides a formal curriculum aimed to foster the development of some of our core values – Compassion, Advocacy, Responsibility, and Empathy – from the beginning and throughout medical school. The E4C faculty will serve as a teacher, mentor and colleague for the duration of the student's time at the School of Medicine. Each E4C faculty is assigned five to six students per class year with the current average load being 24-30 medical students (including MD/PhD and other expanded students).

Faculty applications and additional program information including teaching responsibilities and other activities can be found at <http://med.stanford.edu/e4c/e4capplication.html>. If you have additional questions regarding the program please contact Dr. Lars Osterberg (larso@stanford.edu) or Bahij Austin (bahij@stanford.edu). Applications and all supplemental materials are due on Monday, April 30.

Canary Center Open House

You are cordially invited to an open house and reception at the Canary Center at Stanford, part of the Department of Radiology, where you will be able to tour the facility, learn about current research and meet center faculty and staff.

When: April 30th 5 – 7pm

Where: 1501 S. California Ave, Palo Alto

The Canary Center at Stanford is dedicated to early cancer detection research programs. The mission of the Center is to foster research leading to the development of blood tests and molecular imaging approaches to detect and localize early cancers.

Refreshments will be served. Please RSVP at: <http://www.surveymonkey.com/s/ZRGBRJH>

Awards and Honors

- **Dr. Mark Blumenkranz**, Chair of the Department of Ophthalmology has been named the inaugural holder of the HJ Smead Professorship. A celebratory event to commemorate this wonderful new professorship was held on March 22nd. This new professorship is in memory of the late Harold (Joe) Smead and is made possible through the generosity of the Smead family and the continuing support of Joe's wife Ann Becher Smead. Please join me in thanking the Smead family and in congratulating Dr. Blumenkranz for this lovely honor.

Appointments and Promotions

Neiha Arora has been promoted to Clinical Assistant Professor of Medicine, effective 4/1/2012.

Vinod Bhutani has been reappointed to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 3/1/2012.

Richard Bland has been reappointed to Professor (Research) of Pediatrics, effective 6/1/2012.

Todd J. Brinton has been promoted to Clinical Associate Professor of Medicine, effective 4/1/2012.

James D. Brooks has been promoted to Professor of Urology, effective 4/1/2012.

Helen Bronte-Stewart has been promoted to Professor of Neurology and Neurological Sciences and, by courtesy, of Neurosurgery, at the Stanford University Medical Center effective 4/1/2012.

Ann M. Chen has been reappointed as Clinical Assistant Professor of Medicine, effective 1/1/2012.

Chang-Zheng Chen has been reappointed to Assistant Professor of Microbiology and Immunology, effective 2/1/2012.

Yoon-Jae Cho has been appointed to Assistant Professor of Neurology at the Stanford University Medical Center, effective 3/1/2012.

Benjamin I. Chung has been reappointed to Assistant Professor of Urology at the Stanford University Medical Center, effective 5/1/2012.

Alexander D. Colevas has been reappointed to Associate Professor of Medicine and, by courtesy, of Otolaryngology – Head and Neck Surgery at the Stanford University Medical Center, effective 6/1/2012.

Manisha Desai has been appointed to Associate Professor (Research) of Medicine, effective 3/1/2012.

Jorina Elbers has been appointed to Assistant Professor of Neurology at the Lucile Salter Packard Children's Hospital, effective 3/1/2012.

Michael P. Fischbein has been reappointed to Assistant Professor of Cardiothoracic Surgery at the Stanford University Medical Center, effective 3/1/2012.

Grace Gengoux has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 4/1/2012.

Scott Hall has been reappointed to Assistant Professor (Research) of Psychiatry and Behavioral Sciences, effective 6/1/2012.

Kimberly S. Harney has been promoted to Clinical Associate Professor of Obstetrics and Gynecology, effective 4/1/2012.

Vanessa L. Hsieh-Park has been promotion to Clinical Assistant Professor (Affiliated) of Surgery, effective 4/1/2012.

Yi-Chao Huang has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 12/1/2011

David J. Kennedy has been appointed to Clinical Assistant Professor of Orthopaedic Surgery, effective 5/14/2012.

Kathleen Kenny has been promoted to Clinical Associate Professor of Medicine, effective 5/1/2012.

Alaina Kipps has been appointed to Clinical Assistant Professor of Pediatrics, effective 3/26/2012.

Sirisha Komakula has been reappointed as Clinical Assistant Professor of Radiology, effective April 14, 2012.

Albert Kuo has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 4/1/2012.

Leslie H. Lee has been promoted to Clinical Associate Professor of Neurology and Neurological Sciences, effective 7/1/2012.

Christopher Longhurst has been promoted to Clinical Associate Professor of Pediatrics, effective 4/1/2012.

Nathan Luna has been promoted to Clinical Assistant Professor of Pediatrics, effective 4/1/2012.

N. Grant Miller has been promoted to Associate Professor of Medicine, effective 4/1/2012.

Karen J. Parker has been reappointed to Assistant Professor (Research) of Psychiatry and Behavioral Sciences, effective 5/1/2012.

Lynn Peng has been reappointed as Clinical Assistant Professor of Pediatrics, effective 12/15/2011

Edward Plowey has been appointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 3/1/2012.

Stephen Ruoss has been promoted to Professor of Medicine at the Stanford University Medical Center, effective 3/1/2012.

Kathleen Sakamoto has been appointed to Professor of Pediatrics, effective 3/1/2012.

Christina Smolke has been promoted to Professor of Urology, effective 4/1/2012.

Simon Tan has been reappointed as Clinical Assistant Professor (Affiliated) of Neurology and Neurological Sciences, effective 8/1/2012.

Andrea Tom has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine, effective 12/1/2011

Glyn D. Williams has been promoted to Professor of Anesthesia at the Stanford University Medical Center, effective 3/1/2012.

Greg Zaharchuk has been promoted to Associate Professor of Radiology, effective 3/1/2012.

Dean's Newsletter

April 23, 2012

Medical Student Admit Weekend 2012

A record number of students participated in “*Admit Weekend 2012*,” which took place from Thursday, April 12th through Saturday, April 14th. Over a hundred students, all admitted to the Stanford MD or MSTP program, visited campus to help solidify their decision about where to attend medical school. I am very appreciative of the Office of MD Admissions staff, the Center of Excellence in Diversity in Medical Education, the Stanford University Medical Center Alumni Association and the many faculty, staff and students who worked diligently and enthusiastically to make this a great experience for our visiting students. We are so very fortunate to have so many outstanding applicants to our medical school, and we are privileged that so many of the students who have been admitted are considering matriculation in the class entering in 2012. Without question the remarkably talented students who join our community play a unique role in what makes Stanford such a unique place.

We are well aware that the students admitted to Stanford have other outstanding options available to them. We further recognize that many factors contribute to each student's decision matrix. While we are certainly biased, we also recognize that Stanford provides resources,

opportunities and a learning environment that are not available at other institutions. Our comparatively small class and overall school size offer a more intimate setting for students to interact with each other and with outstanding faculty and staff. The close physical connection between the medical school and our two major teaching hospitals as well as the close physical proximity of the medical center to all of Stanford University provide seamless and unparalleled opportunities for interdisciplinary education and research.

With over 135 allopathic schools of medicine in the US, students have many different opportunities to consider. Some schools have large class sizes (the University of Illinois tops the list) while others, like Stanford, have less than a hundred students per class. Most every medical school has as its primary mission the education and training of future physicians, although they vary in their focus on primary care opportunities and training environments in rural or urban centers. Certainly Stanford is committed to the education and training of outstanding clinicians. But it is unique among medical schools in its additional focus on educating and developing future physician-scholars, scientists and leaders. Equally importantly, Stanford embraces the entirety of the University to achieve its education and training opportunities. It thus moves beyond the boundary of health science *per se* to create an educational environment more akin to a research university, in which there are numerous interdisciplinary opportunities encompassing medicine, science, engineering, law, education and beyond. For students who are interested in a multifaceted career path, the opportunities at Stanford are truly exceptional (see: <http://med.stanford.edu/education/>) and, as I outlined in my April 9th Dean's Newsletter (see: <http://deansnewsletter.stanford.edu/#3>), constantly evolving.

During Admit Weekend 2012 prospective students were exposed to various facets of the life of a Stanford medical student. They participated in discussions about some of the unique features that set us apart from other schools, including our Scholarly Concentration Program, Joint Degree Programs, MD/PhD (MSTP) Program, the numerous education and support programs that enrich learning and career development (e.g., Academic Advisors, Educators for Care) and our important programs in financial aid and support. Prospective students had the opportunity to tour our unique learning environments, clinical programs, community sites and special programs. And perhaps most importantly they had time to interact with each other and with current Stanford medical students, residents, faculty and staff. We celebrate the incredible contributions being made to improve the education and life development of our students and trainees – and look forward to the beginning of new journeys this August. Of course it is important to recognize and acknowledge that we also have much work to do in the years ahead to further refine the educational experiences for our students (see below), and we are committed to doing that.

Changing Expectations for Medical School Students

Changes in medical school education – and in the educational experiences students had prior to coming to medical school – do change over time, but in a more evolutionary than revolutionary manner. As previously discussed, most medical schools still follow the preclinical and clinical division of the four year curriculum that came into being following the Flexner Report of 1910 (see: http://www.carnegiefoundation.org/sites/default/files/elibrary/Carnegie_Flexner_Report.pdf) and the review by Molly Cooke et al entitled “American Medical Education 100 Years after the Flexner Report” that was published in the New England Journal of Medicine (see: <http://www.nejm.org/doi/full/10.1056/NEJMra055445>). It is true that medical schools, including

Stanford, have sought ways of better integrating clinical and preclinical education and training – but, for the most part, these remain discrete and even separate experiences.

In a similar vein, the “premedical education requirements” have also changed relatively little – even from the time when I applied to medical school some decades ago. It is important to note that a baccalaureate degree is not required for entry to medical school in many other parts of the world (where medical school follows high school) but that this has been a tradition in the US (with the exception of several schools that have tried to shorten the college-medical school curriculum to six years by consolidating various courses and requirements). While the major reason that US schools continue with a bachelor’s degree prior to medical school is to foster a “broad educational experience,” the reality is that most students wind up concentrating in variations on human biology rather than pursuing studies in the humanities or the social sciences. And the required courses, even though relatively few in number, do take up precious time, although some have questionable relevance for modern medical education.

Some schools, the University of Pennsylvania being an excellent example, offer suggested areas for undergraduate study as an alternative to “requirements” (see: <http://www.med.upenn.edu/>). I believe this is an area needing further discussion and we will be examining whether we should move to a similar “recommendation” model at Stanford. As someone who concentrated in philosophy as an undergraduate (like a number of my colleagues who have spent their subsequent careers steeped in science) I do believe that students should have an opportunity to explore broadly and deeply in many different disciplines before entering medical school. But this will require some further discussion – since many students are still concerned about deviating from the tried and true path to medical school, which remains traditional and somewhat limiting if not inflexible.

This dialogue will be further catalyzed by the recently approved changes to the Medical College Admission Test (MCAT), which will become operative in 2015. I have forecast some of the planned changes in prior Newsletters (see: http://deansnewsletter.stanford.edu/archive/03_07_11.html#3), and they are now being communicated more broadly through the Association of American Medical Colleges (see: <https://www.aamc.org/newsroom/reporter/march2012/276772/word.html> and <https://www.aamc.org/initiatives/mr5/>). A recent Perspective article in the April 5, 2012 issue of the New England Journal of Medicine by R Kaplan et al entitled “*Building a Better Physician – The Case for the New MCAT*” (see: <http://www.nejm.org/doi/full/10.1056/NEJMp1113274>) highlights the changes and some of the factors that guided them.

For perspective, the MCATs have been administered for 80 years, and the last major change in their format was in 1991. The new MCAT exam that will go into effect in 2015 will be the fifth version of this exam; this new version represents the work of dozens of academic leaders and educators over the past several years. As the headliner, the 2015 MCAT will have four components and will include a new section on behavioral and social sciences. This addition signals an expectation that the social sciences are an important part of the practice and science of medicine – but also that there is a strong movement to make future physicians more enlightened and engaged in the social determinants of disease in addition to their biological and physical science underpinnings. There is also a goal of selecting and educating future doctors who will espouse humanistic knowledge and professionalism and that these may be enhanced by more exposure to behavioral and social science education.

More specifically, here is the outline of the proposed MCAT5 as reported from the Committee (see: <https://www.aamc.org/download/273766/data/finalmr5recommendations.pdf>)

1. **The MCAT5 committee's recommendations describe four test sections:**
 - a. Biological and Biochemical Foundations of Living Systems
 - b. Chemical and Physical Foundations of Biological Systems
 - c. Psychological, Social, and Biological Foundations of Behavior
 - d. Critical Analysis and Reasoning Skills
2. **For the natural sciences sections, the proposed exam will:**
 - a. Test introductory biology, organic and inorganic chemistry, and physics concepts,
 - b. Test highly-rated biochemistry concepts at the level taught in most first-semester biochemistry courses,
 - c. Test cellular/molecular biology topics at the level taught in most introductory biology sequences,
 - d. Target basic research methods and statistics concepts described by many baccalaureate faculty as important to success in introductory science courses, and
 - e. Ask examinees to use their knowledge of natural sciences concepts to demonstrate skill in scientific inquiry and reasoning, research methods, and statistics.
3. **For the social and behavioral sciences, the proposed exam will:**
 - a. Test examinees' knowledge and use of concepts in psychology, sociology, and biology that provide a solid foundation for learning in medical school about the behavioral and socio-cultural determinants of health,
 - b. Target concepts taught at most colleges and universities in one-semester introductory psychology and one-semester introductory sociology courses, and
 - c. Require examinees to use knowledge of social and behavioral sciences concepts to demonstrate skill in scientific inquiry and reasoning, research methods, and statistics.
4. **The proposed exam eliminates the Writing Sample section and replaces it with a Critical Analysis and Reasoning Skills** section will test examinees' reasoning by asking them to critically analyze information provided by passages from a wide range of social and behavioral sciences and humanities disciplines. This section will not require specific knowledge in these disciplines but, by calling them out, may prompt students to read broadly as they prepare for medical school. Along with many others, passages about ethics and philosophy, cross-cultural studies and population health will be included.

It is likely that over the next several years a number of changes in undergraduate education and medical school requirements will take place. This is an opportunity for Stanford to assume a leadership role and to seek ways to create better links between college and medical school education and, equally importantly, to better prepare future physicians, scientists, scholars and leaders for the career opportunities that will unfold in the future. These and the related changes underway could further evolve to become more revolutionary – which would be good.

More Thoughts About Our Learning Environment

Since I commented on a “Respectful Learning Environment for our Students” in the February 20, 2012 issue of the Dean’s Newsletter (see: http://deansnewsletter.stanford.edu/archive/02_20_12.html#3), I have had numerous further discussions with leaders in medical education, faculty, students and staff. From the numerous discussions and forums I have participated in, it seems clear that student mistreatment that is based on sex harassment or gender or racial bias is exceedingly rare at Stanford. But then again, this should **never** take place in any education setting or in any part of our workplace. Behavior represented as sexual or gender harassment is unacceptable and intolerable. Any evidence of this kind of behavior impacting students and trainees should be brought to the attention of our Ombudsperson, the Associate Dean for Student Life or my office directly. Such complaints would be carefully investigated in a confidential manner that is designed to protect against any form of retaliation. There is zero tolerance for such behavior.

I have also learned that concerns about the learning environment in medical education are being expressed at medical schools across the nation and they focus on experiences of public humiliation, concerns about physical harm and requests for personal services. Clearly these are different experiences and require different assessments and outcomes. From what I have learned since my February communication, experiences of public humiliation are not infrequent. At a minimum they represent a clash between, on one hand, previously accepted approaches to pedagogy or perspectives on medical education and the training of doctors, and, on the other, what any of us should consider acceptable methods of teaching in the 21st century. While some of these approaches may be well intentioned and often are referred to as the “Socratic Method” of education, it is also clear that this style of education, especially in clinical settings, is too frequently associated with feelings of “humiliation” – both perceived and real. Encounters experienced as humiliation occur almost exclusively in clinical settings and result from student interactions with faculty, residents, nurses, fellow students – and even patients.

I recognize that we all experience human interactions differently and with different feelings and perceptions. I also recognize that some encounters experienced as “humiliation” were not intended to be such – but that in other situations the humiliation was intended and purposeful, regardless of the motivation. While it is not unlikely that the more serious incidences of “humiliation” are experienced by a subset of our community – the reality is that many students have had an encounter that has raised concern. While we certainly need to better prepare students for some of the events and challenges they will encounter in clinical settings, we also need to raise the awareness of our broader community – faculty, residents, nurses, students, staff – that some intended teaching and educational encounters are being experienced negatively.

My intention in this communication is not to assign blame or to overstate or understate the issue of student mistreatment. It is to convey that the problems and perceptions about mistreatment experienced as public humiliation are real and that we need to address them as a community. Over the next months we will be gathering additional data and engaging in various discussions and dialogues with students, trainees, faculty and staff. I am certainly cognizant that some members of our community have expressed a concern that too much public discourse might inadvertently increase reporting of perceived or real mistreatment. It is true that when issues once repressed become more public, there can be an increase in reportable events. But it seems far better for our community to be forthright and transparent – and to be willing to learn and help each other better understand the scope and nature of factors or interactions that are negatively

impacting our learning environment. Then we will be able to deal with them responsibly and honestly. This will require engagement by all of us.

Medicine and the Muse 2012

The symposium on Medicine and the Muse has become a deeply valued experience and tradition at Stanford. I have had the opportunity to attend virtually every one of these events over the last decade – but unfortunately I was away when the 11th Annual Medicine and the Muse Symposium was held this April. I heard from many members of our community that it was an outstanding event. Since I couldn't share an update with you based on my own experiences, I asked Dr. Audrey Shafer, Professor of Anesthesia and Co-Director, Biomedical Ethics and Humanities Scholarly Concentration, to prepare a summary of the symposium. I am pleased to share it with you here.

The 11th annual *Medicine and the Muse Symposium*, hosted by the Arts, Humanities and Medicine Program, Stanford Center for Biomedical Ethics, and the Center for Innovation in Global Health, welcomed an audience of 200 to LKSC on April 11, 2012 to celebrate the artistic creativity of our students and to focus on the role of journalism in global health.

Organized by first year medical student Meghan Galligan, who directed an enthusiastic team (Anna Do, MSI; Prajakta Jaju, MSI; Rachel Lee, MSI; Gloria Yiu, MSIV and Bonnie Chien, MSI) under the theme of "Transcendence," the event featured an original composition for violin by Ben Robison, MSI, inspired by the deep relationship of health and culture as expressed in the music of the Sicangu Lakota tribe and Brazilian avant-garde; belly dancing by Patricia Ortiz-Tello, MSTP IV; a group poem on the body by the Creative Writing class; an original composition for voice and guitar written for the Family Medicine Clerkship module on end-of-life issues -- entitled Ode to Advance Directives by Nicole D'Arcy, MSIV and Anna Krawitz, MSIV; and a reading by Shervin Wang, MSI, on the importance of respecting the fears of a pediatric patient and what can be learned from an equine class on communication and teamwork. Senior Associate Dean Prober opened with remarks on the remarkable dedication to the arts and humanities by members of the medical school, and Senior Associate Dean Michele Barry emphasized the importance of communication literacy in global health and the launch of the fellowship on global health and the media. Audrey Shafer, MD, awarded prizes to the winners of the first Medicine and the Muse Global Health student writing contest to runners up Amrapali Maitra, MSII and Pria Anand, MSII and to the first place recipient, Laura Saucier, MSI, who read her essay on the value of putting a face on the otherwise benumbing statistics of global AIDS deaths.

Another first for Medicine and the Muse was the delivery of the keynote speech by an alum of the medical school: Sheri Fink, MD, PhD, a Pulitzer prize winning journalist for her article on Memorial Hospital in the aftermath of Katrina and the author of a book on the desperate work by physicians and health care workers during the Bosnian War. Fink spoke on the power of the word, the ethical obligations to be cognizant of that power, the separate roles of reporter and aid worker (she has also done humanitarian work), and the importance of exhaustive fact checking and obtaining as complete a story as possible even in the current age of sound bite journalism. The symposium closed with an exhibit displaying the amazing array of visual arts talent at the medical school and center.

The National Advisory Council Visits the School of Medicine

Today, April 23rd, is the annual visit of the School of Medicine's National Advisory Council (NAC). The NAC is comprised of outstanding national leaders in medicine and science who review high-level strategic initiatives taking place at Stanford and report their observations and recommendations to the President and Provost. NAC members include:

- **Dr. Ed Benz**, President, Dana Farber Cancer Institute, Harvard University. Dr. Benz serves as chair of the NAC.
- **Dr. Huda Akil**, Co-Director and Research Professor, Molecular and Behavioral Neuroscience Institute, University of Michigan
- **Dr. Tom Boat**, Vice President for Health Affairs and Dean, University of Cincinnati College of Medicine
- **Dr. Jennifer Rubin Grandis**, Vice Chair of Research and Professor, Department of Otolaryngology, University of Pittsburgh School of Medicine
- **Dr. Helen Hobbs**, Director, McDermott Center for Human Growth and Development and Professor of Medicine and Molecular Genetics, UT-Southwestern Medical Center
- **Dr. Larry Kaiser**, Senior Executive Vice President for Health Sciences and Dean, School of Medicine, Temple University School of Medicine
- **Dr. Dan Lowenstein**, Professor of Neurology and Director of Physician Scientist and Education Programs, UCSF School of Medicine
- **Dr. Trudy Mackay**, Professor of Genetics, North Carolina State University
- **Dr. Elizabeth Nabel**, President, Brigham & Women's Hospital, Harvard Medical School
- **Dr. Arthur Rubenstein**, Past Dean and Professor of Medicine, University of Pennsylvania
- **Dr. Bill Stead**, Director of the Informatics Center and Associate Vice Chancellor for Health Affairs, Vanderbilt University Medical Center

This year's meeting has a different perspective, given the leadership transitions that will take place in the School over the next couple of years (obviously including my own). With that in mind, this year's NAC is focused on some of the major ongoing challenges we face in the immediate future. The NAC meeting begins with my "State of the School Update", some of which is gleaned from the issues I summarized in my January 9, 2012 DNL entitled "What Comes Next" (see: http://deansnewsletter.stanford.edu/archive/01_09_12.html#1). The internal and external forces impacting medical schools, including Stanford, are notable and include the challenges of funding for research, especially from the NIH, the continuing impact of economic decline, the uncertain changes that will emerge from healthcare reform – or at a minimum, the reductions in healthcare payments overall as well as how payments are formulated.

This is a time that requires institutions to be clear minded about their missions and goals and focused on how to assure their integrity during challenging times. Given this reality, we will be sharing a review of the integrated clinical planning underway with SHC and LPCH and how we are preparing for the future in this domain. We will review the major capital projects underway in the Medical Center and how they will be supported and coordinated. This is a time of major and remarkable facilities growth and transformation. We will also discuss how new technologies are transforming education and how we will prepare medical students and graduate students for successful futures. Enriching the diversity of our faculty has been a major initiative and an update on this work in progress will be shared with the NAC. Finally, the evolving initiative in precision medicine and population health sciences will be a topic for review and discussion.

Needless to say, there are major other initiatives underway that we will be discussing with the NAC – all of course aimed at making Stanford an ever better school of medicine.

Stanford Medicine Features the Future of Psychiatry

Once again *Stanford Medicine*, the award-winning publication of our Office of Communication and Public Affairs, has succeed in addressing an important issue with thoughtful exposition. The spring issue addresses the Future of Psychiatry and offers a number of important and provocative stories and reports. *Stanford Medicine* is available on line at <http://med.stanford.edu/ism/2012/april/magazine.html>. Once again I want to thank Rosanne Spector, Paul Costello and the team in the Office of Communications and Public Affairs for another compelling report.

Upcoming Event: 29th Annual Medical Student Research Symposium, May 3rd

On Thursday, May 3rd, the **29th Annual Medical Student Research Symposium** will be held in the LKSC Ballroom from 3:00-6:00 pm. Close to 50 MD and MD/PhD students will present their original research ranging from: *Maternal glucose response to betamethasone administration to Nanomedicine at the forefront of medical diagnostics*.

Students will be available at their posters for informal discussion from 3:00-5:30 pm. Following closing remarks the event will culminate at 5:45 pm with the announcement of student awards by the Stanford Medical Center Alumni Association. This promises to be a terrific event and I hope you will join our students for this year's Student Research Symposium.

Awards and Honors

- **Dr. Garry Nolan**, Rachford and Carlota Harris Professor, Baxter Laboratory, Department of Microbiology and Immunology, is the winner of the highly competitive Teal Innovation Award from the Department of Defense. The funds will be used to apply single cell technology developed by the Nolan Lab to ovarian cancer.
- **Dr. Gabriel Garcia**, Professor of Medicine and co-founder of a program that trains Stanford undergraduates to serve as volunteers in local health clinics, will receive the 2012 Miriam Aaron Roland Volunteer Service Prize at an awards luncheon this week.
- **Dr. Oxana Palesh**, Assistant Professor of Psychiatry & Behavioral Sciences, has been selected by the American Psychological Association's Socioeconomic Status Related Cancer Disparities Program (SESRCDD) to serve as a Behavioral Social Science Volunteer (BSSV) Awardee to assist regional cancer serving organizations to address health disparities in cancer.
- Of the 220 individuals elected to the *American Academy of Arts and Sciences*, nine are members of the Stanford faculty, including three in the School of Medicine. They are:
 - **Ann Margaret Arvin**, Vice Provost and Dean of Research, Lucile Salter Packard Professor of Pediatrics and Professor of Microbiology and Immunology
 - **Ben A. Barres**, Professor of Neurobiology, Developmental Biology, and Neurology and Neurological Sciences
 - **Stuart K. Kim**, Professor of Developmental Biology and of Genetics

Congratulations to Drs. Arvin, Barres and Kim.

Dean's Newsletter

May 8, 2012

Launch of the Campaign for Stanford Medicine

Last evening, at a reception held on the Alumni Lawn in front of the Li Ka Shing Center for Learning and Knowledge, President John Hennessy announced the launch of the Campaign for Stanford Medicine (<http://med.stanford.edu/ism/2012/may/campaign.html>). This new campaign follows the highly successful Stanford Challenge, which was completed at the end of December 2011 (<http://thestanfordchallenge.stanford.edu/highlights-by-school/school-of-medicine/>). It will focus on the Stanford University Medical Center (SUMC) and specifically on the Stanford Hospital & Clinics (SHC) and the School of Medicine (SoM). The Campaign for Stanford Medicine has a fundraising target of \$1 billion over the next 2-3 years. The major emphasis of the Campaign will be to seek gifts to help support the new Stanford Hospital, a nearly \$2 billion construction project that began at the end of 2011.

The Lucile Packard Children's Hospital, also an integral member of the SUMC, is currently completing its \$500 million campaign, "*Breaking New Ground*," which will permit the expansion of LPPH by adding approximately 150 additional private patient rooms, along with surgical, diagnostic and treatment areas and wonderful new gardens for children and families. The *Breaking New Ground* Campaign has also raised financial support for School of Medicine academic programs and has been a collaborative effort between the leadership of the Lucile Packard Children's Hospital and the Stanford School of Medicine.

The Campaign for Stanford Medicine marks the initiation of an integrated and coordinated effort among the leadership and Offices of Medical Development of SHC, SoM and Stanford University. As noted by President Hennessy, the Campaign will seek \$700 million for new hospital construction and \$300 million for the education and research missions of the School of Medicine.

While an immediate fundraising target of \$1 billion over the next 2-3 years is obviously quite ambitious, the wonderful news that President Hennessy announced is that the medical center is already halfway to achieving this goal, with \$500 million recorded in pledges and expectancies. This includes \$50 million gifts each from Anne and Robert Bass, John and Tashia Morgridge, and the Redlich family that will name three of the four pavilions. Needless to say, each of these is an extraordinary gift and is evidence of the deep respect and commitment to Stanford Medicine and Stanford Hospital & Clinics of highly respected leaders in our local and global community. In addition to these incredible individual gifts, President Hennessy announced that seven companies have committed \$175 million for the new hospital project through the Stanford Hospital Corporate Partners Program. Included among these corporate partners are Apple, eBay, Hewlett-Packard, NVIDIA, Intel, Intuit and Oracle. This generosity exemplifies the community support for the new Stanford Hospital, which will be completed in 2017.

Academic Medical Centers across the nation have played a critical role in transforming medicine through their missions in education, research, patient care and service to the community. Stanford University Medical Center is one of the nation's premier centers of excellence but, like its peers across the nation, faces major challenges as funding for research declines and the cost for healthcare delivery continues to rise to levels that are not sustainable without major changes and transformations. These challenges make the role of Stanford Medicine even more vital as we seek new solutions and serve as a model of excellence committed to improving the health of our communities. We envision four interconnecting pillars that will support and transform Stanford Medicine in a continuous cycle of discovery and innovation. These are:

1. ***Fostering Innovation and Discovery to Create New Knowledge and Shape the Future of Health and Healthcare.*** This will include fundamental research to create the building blocks for new insights into human biology along with innovations that will be coupled with novel ways of accelerating discoveries from the laboratory to the patient.
2. ***Promoting Health by Defining and Determining the Risks to Health on a Personal Level and Using Precision Medicine Along with Population Health Sciences to Transform the Health of Our Community.*** This will utilize the rapidly evolving technologies that reveal our fundamental biologic make-up and the ways in which it interacts with environmental forces to shape health and the risks for disease. The ability to utilize and analyze large databases along with novel and rapidly evolving information technologies will shape how, when and where healthcare is delivered with the highest quality and value to individuals and communities.
3. ***Translating Discoveries to Address Major Health Challenges through the Stanford Institutes of Medicine*** and through the efforts of Interdisciplinary Centers, Departments and faculty working through novel and integrated collaborations between the School of Medicine and Stanford Hospital & Clinics.
4. ***Educating and Training the Future Leaders of Science and Medicine to Transform the Future and Create a Continuous Cycle of Renewal, Innovation and Discovery.***

These integrated goals build on the advances that have been achieved over the past decade (see "What Comes Next" in http://deansnewsletter.stanford.edu/archive/01_09_12.html). Importantly, these and related efforts will be further refined, defined and expanded over the next couple of years when a new Dean for the School of Medicine is appointed and creates new visions for a future of excellence. While campaigns often have defining starts and completion dates along with targets and accomplishments, the future of institutions like Stanford is not marked by boundaries but by an exponential march toward continued excellence. This is a journey that builds on our past but that aims to create a new future.

You will shortly be receiving via email the current issue of "Inside Stanford Medicine," which includes additional coverage of the Campaign.

Alumni Reunion 2012: Looking Backward Helps Define Looking Forward

A high point of each year is the opportunity to welcome alumni from the Stanford University Medical Center back to The Farm. We are, in so many ways, the beneficiaries of their work – whether it was done in San Francisco or Palo Alto, in the classroom, research laboratory or

clinical setting. While one of the most important purposes of an alumni reunion is the opportunity to reconnect with colleagues, teachers and friends, it is also a time to relive memories of time spent together at Stanford.

A University and medical school are certainly defined physically by their buildings and facilities – many of which evoke memories and emotions that run wide and deep and that harken back to the formative stages of one's life and career. Of course, most buildings are transient and, except for a few iconic ones, go through renewal and sometimes obsolescence and rebuilding. This is true for education and research buildings – as well as for clinical facilities. We are living through this every day as Project Renewal moves forward for the building of a new Stanford Hospital and a major addition to the Lucile Packard Children's Hospital. Of course, some give special significance to the buildings being replaced (e.g., the original 1959 ED Stone Buildings) based on personal memories and experiences that recall different times, needs and expectations. Today, most of those working in clinical settings at Stanford recognize that these buildings, now more than 50 years old, are seismically challenged and no longer matched to the purposes they were designed for in education, research and patient care.

For example, the new Li Ka Shing Center for Learning and Knowledge replaces the Alway education facilities and makes the latter seem quite obsolete. That said, there are many in our community – including a number of our alumni who visited Stanford this past weekend – who have wonderful memories of these facilities and feel some sadness that they no longer feature prominently in the minds of current students and trainees. This is part of our cycle – like the memories evoked by family pictures in albums that sit on shelves gathering the dust of time or the photos that come and go from our screen savers or that are snapped and put into cyberspace from our cellphones. Different times and different memories.

It is easy for those with no personal memories or recollections of a facility to misunderstand or even to be unaware of memories associated with it that are cherished by prior generations. This can have consequences, as was recently exemplified by the demolition of the Anatomy Building, which was used for medical student education from 1910 through the Loma Prieta earthquake in 1989. This building had been vacated and mothballed for more than two decades - long before I arrived at Stanford. But even though it was empty and all of its vital components had been collected more than a decade ago, when it was taken down by the University to make way for a new Art Building, a "home" for many of our alumni was lost. That this loss was not acknowledged and addressed is unfortunate. Similar feelings were evoked when the Fairchild Auditorium, on which the current LKSC now sits, was demolished several years ago to make way for the future.

Without question, this cycle of demolition and renewal will occur many times in the future – and will be both mourned and celebrated, depending on which side of the memory divide one sits. That said, activities allowing us to sustain memories need to be more hardwired into our future. This can come in different ways – pictures, stories or memorabilia. Thanks to the foresight of Dr. Don Prolo, MD'61, and the concern and dedication of Dr. Linda Hawes Clever, MD'65, Associate Dean for Alumni Affairs, a number of "bricks" from the Anatomy Building have been retrieved, gathered and stored. The Alumni Office will develop ways of "sharing" some of these memorabilia over the next months.

Honoring the past of Stanford Medicine was also celebrated at Alumni Day by the dedication of the Discovery Walk project, which I commissioned when the planning began for the Li Ka Shing Center for Learning and Knowledge (see <http://med.stanford.edu/ism/2012/april/artwalk-0423.html>). I have long observed that Stanford is unique in its emphasis on looking forward rather than paying homage to the past – which almost certainly contributes to its spirit of discovery and innovation. Missing are the all too officious portraits of institutional leaders, often monotonously featured in hallways, lecture rooms and conference centers at more traditional east coast institutions. That style seemed inappropriate for Stanford. The “history project” that can be found in the Discovery Walk consists of narratives that have been laser etched into black granite quarried in Mongolia and that adorn the planters along Discovery Walk, telling the history of Stanford Medicine in a unique way.

The Discovery Walk is the work of Susan Schwartzberg, a photographer and visual artist who conceptualized and then developed the project with a team that included Leah Elamin, Gayle Laird, Gabe Meil and Akiko Ono. The project was coordinated at Stanford by Maggie Saunders and presently includes 347 granite panels. The narratives etched onto their surfaces are based on conversations with over 200 Stanford scientists, alumni, faculty, students and staff. Special thanks also go to Dr. Ross Bright, former Associate Dean for Alumni Affairs. I hope that this visual journey, which captures the transition of Cooper Medical College to the Stanford University School of Medicine and its Medical Center, is meaningful to alumni past and present. I also hope that current members of our Stanford community will take time now and then to stop along the way and learn more about Stanford history and how it has shaped who we are today.

It is often said that history is a prologue to the future. But that simple truth may be about to be turned on its head – or “flipped,” as the current phrase goes. This too has relevance to our alumni as well as our current and future students. To be more specific – when the Li Ka Shing Center for Learning and Knowledge (LKSC) opened in 2010 it represented one of the most advanced centers for medical education in the world. I am happy to say it still does - but it seems likely that it will be used in ways that were only barely foreseen when it was being conceptualized and developed. Certainly a cornerstone of the LKSC is its flexibility and advanced technologies. But we recognized even as we moved into the new facility that these state of the art technologies were rapidly changing. The number of wireless devices far exceeded expectations, and the early planning of the LKSC didn’t foresee that iPads, laptops and other mobile devices would be used in very novel ways – with increased need for broadband and flexible change. So even though we did our best to make the LKSC the educational facility of the future, even the most advanced technologies become dated with remarkable speed – the future of technology all too rapidly becomes a prologue to the past.

And while Stanford has had streaming videos of medical school lectures available to students for decades, the world of education and learning technologies is at the cusp of change that will be transformative and likely disruptive. Change is happening at Stanford and throughout the US. Recently, two new companies have emerged from Stanford’s School of Engineering that are changing the face of on-line education. One of these is Coursera, founded by Computer Science professors Andrew Ng and Daphne Koller (see <http://www.nytimes.com/2012/04/18/technology/coursera-plans-to-announce-university-partners-for-online-classes.html>). In a similar vein, for over a year, Dr. Charles Prober, Senior Associate Dean for Medical Education and Professor of Pediatrics, has been developing a collaboration with Sal Khan, founder of the Khan Academy (see:

<http://www.khanacademy.org/>), that has the prospect of transforming medical education using the same remarkable tools that the Khan Academy is providing to primary and secondary education (and beyond) – for free and on a global basis. Indeed, the goal of the Khan Academy is to change education for the better by providing a free world-class education to anyone anywhere.

The ways that new learning technologies will change education has been likened to “*The Campus Tsunami*” by David Brooks in his May 4th opinion piece in the *New York Times* (<http://www.nytimes.com/2012/05/04/opinion/brooks-the-campus-tsunami.html?ref=opinion>) – referring to a quote by President John Hennessy in a April 30th article by Ken Auletta in the *New Yorker Magazine* (see: http://www.newyorker.com/reporting/2012/04/30/120430fa_fact_auletta). The title of that article, “Get Rich U,” is somewhat misleading since the article is otherwise interesting and even thoughtfully provocative. While these reports focus on undergraduate college and university education, the concepts are highly relevant to medical education and learning as was thoughtfully reviewed by Charles Prober and Chip Heath, in a Perspective article entitled “*Lecture Halls without Lectures – A Proposal for Medical Education*” in the May 3rd issue of the *New England Journal of Medicine* (see: <http://www.nejm.org/doi/full/10.1056/NEJMp1202451>). For additional details you can listen to his recent interview with Paul Costello, Chief Communications Officer for the School, on the award-winning 1:2:1 podcast series (see: <http://med.stanford.edu/121/2012/prober.html>).

I shared some of these coming changes with our alumni during my address to them during Alumni Weekend. The world around us is changing rapidly and it is good to know that Stanford Medicine is helping to lead these changes – which will affect all of our learning environments in the future.

So while alumni return today to a visible spot – with its history and memories – it is plausible that alumni of the future will never leave Stanford, since Stanford will instead accompany them to their homes in cities and nations globally. This digital transformation is occurring not just in education, but also in research, where ever-larger databases require new computation modalities and algorithms to organize and make sense of a rapidly digitizing world. This digitation is also rapidly evolving in clinical medicine and will almost certainly change the interactions among doctors and patients, institutions and communities. A forecast of some of these changes is described in Eric Topel’s recent book entitled “*The Creative Destruction of Medicine: How the Digital Revolution Will Create Better Healthcare*” (Basic Books: New York, 2012). But even this provocative look at the future will likely miss the dramatic changes that will unfold in the years and decades ahead – almost certainly in ways that we don’t even know about today. And while these changes unfold, it will be essential that we not lose the human connections that define and connect us – as alumni, as colleagues, as doctors, patients, friends and communities.

Medical Student Research Day 2012: A Tradition Continues

On May 3, 2012 the 29th Annual Medical Student Research Symposium was held in the Paul and Mildred Berg Hall in the Li Ka Shing Center for Learning and Knowledge. This highly anticipated annual event was hosted by the Stanford University Medical Center Alumni Association (<http://med.stanford.edu/alumni/>) and Drs. Joan Lombardi, MD’83, President, and Linda Hawes Clever, MD’65, Associate Dean for Alumni Affairs. I also want to thank this year’s Planning Committee, which included Dr. Loren Baker, Director of Medical Student Research &

Scholarship and Professor of Health Research and Policy, along with Mara Violanti, Assistant Director of Medical Student Research & Scholarship, and Joan Menees, Medical Scholars Program Coordinator. I also want to thank the 2012 Student Committee comprised of Joel Bronstein, James Chen, Tyler Hillman, Kim Kukurba, Joshua Lee, Rachel Lee, Desiree Li, Nayna Lodhia, David Nguyen, and Edward Pham. Their collective efforts made this year's research day incredibly successful.

This year's Research Symposium featured nearly 50 poster presentations, representing 12 Scholarly Concentrations as well as the MSTP (Medical Science Training Program). Projects included everything from Biomedical Ethics and Humanities to Molecular Basis of Medicine, from Health Services and Policy Research to Clinical Research, and Cancer Biology to Global Health.

Research is an integral component of the education and curriculum of Stanford Medical Students and plays a key role in shaping each individual's career development – whether that eventually will be in clinical or in academic medicine. The skills acquired through a research experience shape critical and analytic thinking and provide the opportunity for future physicians to learn to “think like a scientist” – an incredibly important asset for a life journey in medicine and science.

It has also become a tradition for a portion of the presentations to be selected as award winners by a panel of judges. It is important to underscore that simply conducting research and presenting one's work at the Symposium is grounds for an award. But I do want to acknowledge the students whose work was selected as particularly meritorious. I want to thank all of the judges who carefully evaluated the posters and presentations. This year's winners are:

Student	Mentor	Project Title
<i>Shah Ali</i>	Irving Weissman	<i>Cardiomyocytes undergo division postnatally to generate new cardiomyocytes in mouse models of aging and cardiac injury</i>
<i>Adriana Anavitarte</i>	Alan Cheng	<i>The effect of unilateral hearing loss on speech and language development</i>
<i>Ehte Bahiru</i>	Corinna Haberland	<i>Analysis of the most prevalent opportunistic infections, causes of mortality and characteristics of the inpatient HIV/AIDS patient population admitted in 2008</i>
<i>Jocelyn Chin</i>	Michael Fischbein	<i>Effects of TGF-β1 on Marfan vascular smooth muscle cells reflect pathophysiology of early aortic root aneurysm</i>
<i>Richard Gaster</i>	Shan Wang	<i>Nanomedicine at the forefront of medical diagnostics</i>
<i>Jia Luo</i>	Matthew Scott	<i>Regulation of development and tumorigenesis by the NFI family of transcription factors: convergence with hedgehog signaling</i>

Aaron Ring	K. Christopher Garcia	<i>Molecular engineering of SIRPα: A new strategy in cancer immunotherapy</i>
Mark Sellmyer	Tom Wandless	<i>Visualizing cellular interactions with a generalized proximity repoter</i>
Luz Silverio	Emilie Cheung	<i>Patient adherence with post-operative restrictions after rotator cuff repair</i>
Kipp Weiskopf	Irving Weissman	<i>Evolving high affinity SIRPα variants as immune-based therapies for cancer</i>

Please join me in congratulating all the students who presented their research findings at the 29th Annual Medical Student Research Symposium and to the ten students whose work was designated as highly meritorious. I want to also thank their mentors and all who made their research experience so meaningful and important.

Annual Department of Pediatrics Research Retreat

Dr. Hugh O'Brodovich, the Arline and Peter Harman Professor and Chair of the Department of Pediatrics, shared an update on the recent departmental research retreat that I am pleased to share with you. Here is his summary:

The Department of Pediatrics held the Third Annual Pediatric Research Retreat on Friday, April 20th at the Li Ka Shing Center for Learning & Knowledge. The Retreat was preceded by the Pediatric Grand Rounds speaker Dr. Gabriel Haddad, Chair of Pediatrics at UCSD whose lecture was entitled "*Can human tissues tolerate hypoxia: new insights from flies and people.*" Dr. O'Brodovich then welcomed the Research participants and Chris Dawes, CEO of LPCH, outlined his support for the academic mission of the Department. Two hundred attendees, including faculty, fellows, postdoctoral scholars, residents, research staff and guests, gathered to listen to 12 faculty talks and 4 trainee and Instructor talks, selected by the Retreat Committee. Nearly 80 abstract posters illustrated some of the basic, translational, clinical and educational research ongoing throughout the Department. Prizes were awarded for outstanding abstract, poster, and mug design, which were featured on the souvenir coffee mugs given to attendees. The winners selected to give talks based on their abstracts were Aimee Grace, MD (Resident), Charles Gawad, MD, (Fellow), Bethsaida Nieves, PhD (Postdoctoral Scholar), Valerie Chock, MD (Instructor). Winners for the best posters were Paul Valdmanis, PhD, (Postdoctoral Scholar), Shayna Gaman-Bean, MD (Fellow), Chirag Patel (Postdoctoral Scholar), Narendiran Rajasekaren, PhD (Postdoctoral Scholar) and Anne Hsii, MD, Fellow. The winning mug designs were submitted by Gia Oh, MD, and Manish Butte, MD, PhD.

In addition to the research presentations and posters, Resource Tables during the lunch and poster session provided attendees an opportunity to learn more about the available resources to researchers in the Department, with representatives from Spectrum Child Health Services, CHRI Trainee Grant Support Programs, RMG, LPFCH, the Thrasher Foundation, Stanford Center for Clinical Informatics, the Human Immune Monitoring core, the Research Management Group and Study Facilitator Services.

Awards and Honors

- The past several months have witnessed a number of important awards and recognitions for **Dr. Karl Deisseroth**, Associate Professor of Bioengineering and of Psychiatry and Behavioral Medicine, for his seminal discoveries in the new field of optogenetics. Included in them is the Record Neuroscience Award that he received in February, the Perl/UNC Award that he will receive in May (along with two of his former students, Feng Zhang and Ed Boyden, (both now at MIT) and the Zuelch Prize from the Max Planck Society, that will be shared with algal biologists Peter Hegemann, Georg Nagel, and Ernst Bamberg. And to top it all off, on Tuesday, May 1st, Dr. Deisseroth was elected to the National Academy of Sciences – an incredible accomplishment at this stage of his career!
- **The National Academy of Sciences** announced the election of two other Stanford School of Medicine faculty members in addition to **Dr. Karl Deisseroth** (see above). Also receiving this exceptional honor and recognition by election to the NAS are:
 - **Dr. K. Chris Garcia**, Professor of Molecular and Cellular Physiology and of Structural Biology
 - **Dr. Rob Tibirishiani**, Professor of Health Research and Policy (Biostatistics) and of Statistics
- **Dr. Jeff Norton**, The Robert L. and Mary Ellenburg Professor, received the Flance-Karl Award, the highest recognition of a sustained scientific and clinical contributions. The Awards Committee commented “Dr Norton has made a lifetime of seminal contributions in our understanding of tumor and cytokine interactions and in the immunotherapy of cancer. His translational studies have fundamentally altered the surgical therapy of a number of malignancies”
- **Dr. Sharon Hunt**, Professor of Medicine, is the recipient of the 2012 Lifetime Achievement Award from the International Society for Heart and Lung Transplantation (ISHLT). This is only the fourth time that the ISHLT has conveyed its Lifetime Achievement Award during the Society’s 31-year history.
- An Investiture Ceremony celebrating **Dr. Brian Kobilka’s** appointment as the first incumbent of the Helene Irwin Fagan Professorship was held on Tuesday May 1st. Dr. Kobilka is professor and chair of the Department of Molecular and Cellular Physiology.
- **Dr. H. Peter Lorenz**, Professor of Plastic & Reconstructive Surgery, has been elected as a member into the American Surgical Association – a most prestigious society with only a total of 360 members.
- **Scope Medical Blog** has received the GIA Award for Excellence, the highest honor in its category, from the AAMC Group for Institutional Advancement (GIA). Scope is a group-authored medical blog staffed by our communications and public affairs office offering external audiences a curated source of biomedical news and conversation.

Congratulations to all!

Appointments and Promotions

Caroline Buckway has been reappointed to Clinical Associate Professor of Pediatrics, effective 1/1/2012.

Cynthia J. Campen has been appointed to Clinical Assistant Professor of Neurology and Neurological Sciences, effective 7/1/2012.

Abanti Chaudhuri has been promoted to Clinical Assistant Professor of Pediatrics, effective 5/1/2012.

Katrin Chua has been promoted to Associate Professor of Medicine, effective 5/01/2012.

Shelley Day has been appointed to Clinical Assistant Professor (Affiliated) of Ophthalmology, effective 9/1/2011.

Tri Do has been reappointed to Clinical Assistant Professor (Affiliated) of Radiation Oncology, effective 2/1/2012.

Ann Caroline Fisher promoted to Clinical Assistant Professor of Ophthalmology, effective 4/16/2012.

Linda Foppiano has been reappointed to Clinical Associate Professor of Anesthesia, effective 3/18/2012.

Neil Gesundheit has been promoted to Professor (Teaching) of Medicine, effective 7/01/2012.

Michael Greicius has been reappointed to Assistant Professor of Neurology and Neurological Sciences, effective 6/01/2012.

Cathleen Hebson has been reappointed to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 2/1/2012.

Kyle Hinman has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 6/1/2012.

Seth Hollander has been appointed to Clinical Assistant Professor of Pediatrics, effective 7/1/2012.

Ninad Karandikar has been appointed to Clinical Assistant Professor (Affiliated) of Orthopaedic Surgery, effective 4/1/2012.

Vista Khosravi Soroush has been reappointed to Clinical Assistant Professor (Affiliated) of Dermatology, effective 3/1/2012.

Malathy Kuppuswamy has been reappointed to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 9/1/2011.

Christopher Lee-Messer has been appointed to Clinical Assistant Professor of Neurology and Neurological Sciences, effective 7/1/2012.

Michael S. Leong has been promoted to Clinical Associate Professor of Anesthesia, effective 5/1/2012.

Beth Martin-Kool has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 1/1/2012.

Julianne M. Mendoza has been promoted to Clinical Assistant Professor of Anesthesia, effective 5/1/2012.

Kristina E. Milan has been appointed to Clinical Assistant Professor of Obstetrics and Gynecology, effective 8/15/2012.

Manchula Navaratnam has been promoted to Clinical Assistant Professor of Anesthesia, effective 5/1/2012.

Albert John Popp has been appointed to Clinical Professor of Neurosurgery and by courtesy of Neurology and Neurological Sciences, effective 7/1/2012.

Brian Scottoline has been promoted to Clinical Assistant Professor of Pediatrics, effective 5/1/2012.

Martin Vazquez has been reappointed to Clinical Assistant Professor (Affiliated) of Dermatology, effective 3/1/2012.

Hong Yu has been reappointed to Clinical Assistant Professor of Neurosurgery, effective 8/1/2012.

Gary Zhao has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2010.

Dean's Newsletter

May 29, 2012

Dr. Norbert Pelc Will Become Next Chair of the Department of Bioengineering

At the beginning of the academic year, Dr. Russ Altman, Professor and Chair of the Department of Bioengineering and Professor of Medicine and of Genetics, informed Dr. Jim Plummer, Dean of the School of Engineering, and me that he wished to step down as chair at the completion of his current term. Dr. Altman has played a major role in leading the department since 2007, and we are deeply indebted to him and to the co-leadership provided by Dr. Steve Quake, Lee Otterson Professor of Bioengineering and of Applied Physics. Thanks to their leadership the department has continued to grow, thrive and become one of the leading departments of bioengineering in the nation. The most important achievement has been the continued recruitment of truly outstanding faculty. Today the department is at the cusp of incredible new opportunities, with an exciting undergraduate program now complementing a terrific graduate program, a new facility under construction that will complete the Science and Engineering Quad

in 2014, outstanding new recruitments and amazing research accomplishments. Jim Plummer and I hope you will join us in thanking Russ for his leadership as Chair.

Over the past months we have met with the faculty in the department and heard comments from institutional leaders inside and outside of Stanford about the future of the Department of Bioengineering and its leadership. We are very pleased to announce that Dr. Norbert Pelc has accepted our invitation to serve as the next Chair of Bioengineering and will begin his responsibilities on July 1st. Dr. Pelc has been an instrumental member of the department since its inception and is highly valued for his many contributions as a researcher, mentor and leader. He joined the Stanford community over two decades ago as an Associate Professor of Radiology. Before joining Stanford he was a Senior Physicist and Manager in the Applied Science Laboratory at GE Medical Systems. His contributions have intersected numerous fields and disciplines, as was highlighted in his election to the National Academy of Engineering in 2011 – one of the highest honors in the field of engineering.

Dr. Pelc has played an instrumental role in enhancing the scientific excellence of the Department of Radiology in the School of Medicine, and he will continue to play an important advisory role for that department in the future. His major focus will be to help lead the Department of Bioengineering through its next critical phase of growth and maturation – a task he is uniquely qualified for. The future years will be an exciting time for Bioengineering – a department that has created much deeper connections and bridges between the Schools of Engineering and Medicine than existed prior to its establishment. Indeed, this is one of the most distinguishing features and opportunities of our two schools, and we are pleased that Dr. Pelc, who has served at Stanford with appointments in both Medicine and Engineering, will help faculty and students create unique new fields of endeavor and collaboration.

Stanford Medical School Beginnings and Buildings: A Coincidental Convergence

It is always interesting when unexpected events or sources of information converge in one's mind and evoke memories of the past, present and even future. Such a coincidence occurred for me in the past week when I first received an email reminding me of the origin of the Stanford University School of Medicine and then, quite separately, when I came across a review entitled "Behind the Screen" in the June 7, 2012 issue of The New York Review of Books.

The email came from the grandson of Professor Ophüls, who played a critical role in the formation of Stanford Medical School and in the debate about whether it would be a research program or a "medical school." Professor Ophüls, who became the second dean of the Medical School, serving from 1916 to 1933, was a senior faculty member of Cooper Medical College in 1906. He engaged in extensive correspondence with Stanford President David Starr Jordan concerning Stanford's proposal to acquire the Cooper Medical College. This correspondence, which is preserved in John L. Wilson's history of the School of Medicine (see: <http://elane.stanford.edu/wilson/index.html>), tells a story that could have turned out quite different for Stanford Medicine as we know it today.

At the risk of providing too much information, I am sharing some of the text and letter exchanges from this history – which tells an informative story about our beginnings and what they might tell us about our future. Like all history it has some surprises.

"Consolidation with Stanford University 1906 - 1912

As early as 1901 Dr. Lane and President Jordan met several times on terms of mutual respect to discuss the feasibility of consolidation of Cooper Medical College with Stanford University. These discussions were followed by Dr. Lane's decision in 1902, just prior to his death, to remove all legal impediments to such a course. Indeed, during the last few years of his life Dr. Lane saw that there was no acceptable alternative to union with Stanford. He became convinced that the survival of freestanding propriety American medical schools such as his depended upon merging with a university. Since union with the University of California was, in view of his past experience, unthinkable, the availability of Stanford as an alternative was a godsend.

During Dr. Ellinwood's stormy tenure from 1902 to 1907 in the presidency of Cooper Medical College, growing interest in joining Stanford culminated in a strong consensus among the faculty in its favor. President Jordan was also favorably disposed to a merger of the institutions but before serious negotiations could begin he was obliged to resolve two major issues - the nature of the educational program to be adopted and the source of funds to support it.

February 1906: A Graduate School of Medical Research

On 20 February 1906 Dr. Jordan wrote to Professor Ophüls commenting on Stanford's financial dilemma and asking his advice on establishing a graduate school of medical research in the Cooper premises. [1]

20 February 1906

Dear Dr. Ophüls:

The great difficulty with us - and it tends to grow larger as we get nearer to it - is the question as to whether the University will be able to maintain the Medical School as it ought to be maintained without cramping the Engineering School and the Library, and other departments already established. . .

Would the proposition to devote the property (of Cooper Medical College) to the establishment of a graduate school of medical research, beginning with a few departments and extending them as gifts were received or as funds were acquired, be favorably considered by the Trustees of the Cooper Medical College?

Dr. Ophüls responded on 22 February to President Jordan's letter of the 20th. [2]

22 February 1906

Dear President Jordan:

I received your kind letter of February the 20th today. We understand your misgivings about the financial outlook of the undertaking, still we believe that by proper management any undue expense to the University can be avoided. If you will permit us we should like to submit more detailed plans as to the way in which the change might be best effected, and about the expenses which we would consider necessary to make a creditable beginning. We do not believe that it would be advisable to start on too large a scale but to begin with a working nucleus of good men who would be willing to spend the necessary time and energy without immediate large recompensation in gradually building up a Department which by the prestige given to it by its

connection with the University and by its own efforts would soon develop successfully and if necessary attract endowment.

As the only competing Medical College on the Pacific Coast has already raised its entrance requirements to very nearly the desired level we could hope to attract a sufficient number of students to make such a Medical Department self-supporting.

In regard to your question we feel that the graduate research school should be looked upon as the highest development to be reached eventually. A substratum of several successive student generations of academic culture is necessary to evolve the desire and the capacity for research work of a higher order. From my own experience I know that at present very few men are available who are at all fitted to undertake such work in Medicine and who could successfully support by their work an institution of the kind that you suggest.

We feel that we have to make certain provisions for the coming semester, several important positions should be filled within a reasonable time in justice to our students, still our hands are tied as long as we are uncertain about the future development of our School. On this account it would be desirable from our standpoint to arrive at least at a general understanding within the near future.

Dr. Ophüls advised against establishment of a graduate school of medical research and outlined a process whereby Cooper Medical College's traditional program could be upgraded to university standards at modest cost - an eminently practical approach, but not sufficiently "scholarly" for Dr. Jordan who, in a letter on 24 February, again asked Dr. Ophüls to give his opinion of the graduate school proposal [3]

24 February 1906

Dear Dr. Ophüls:

I have received your kind letter of the 22nd. . . The question as to whether we should engage in elementary medical education is a very large one. . . It would seem to me desirable, if it were possible, that the two medical colleges in the city should be united, either in the name of Stanford or of the University of California (now under the presidency of Benjamin Ide Wheeler). My idea of the research school would be, not to make it dependent at all on the fees or the men who might work in it. . . .

My own feeling at present is in favor of the research idea - of beginning the work without granting the medical degree or any degree other than those now granted by the University. This would mean the development in Stanford University of certain research professorships to be located in the building of the Cooper Medical College and in connection with the Lane Hospital. This college would then become the Department of Medical Research of the University.

I do not wish to put forward this opinion as one which cannot be changed, but at present I am inclined toward it as the most available way of managing the matter on our part. I feel more drawn to the development of a great school of medical research than to the development of a great medical college granting the degree of M. D.

On 5 March 1906, Dr. Jordan pressed Dr. Ophüls further for an opinion on establishing a graduate school of medical research.[4]

5 March 1906

Dear Dr. Ophüls:

Referring to the possibility of developing a school of medical research on the Cooper College

Foundation, I would like to know personally what you think of it; and, if you are in favor of it, I would like to know if you could suggest a workable plan by which such an institution could begin in a small way and rise to an expenditure of fifty or sixty thousand dollars or more a year. I see a good many difficulties in the way, even if the people of the Cooper Medical College were willing to have the property used in that way.

To Dr. Jordan's second appeal for his advice on a graduate school of medical research, Dr. Ophüls again firmly advised against it, this time in considerable detail: [5]

7 March 1906

Dear President Jordan:

. . . Although in many ways it may seem desirable to have only one large Medical School in San Francisco, the practical difficulties in the way of accomplishing this end seem to me insurmountable. On the other hand, comparatively small classes are rather an advantage in a technical school because the instruction can then be a more personal one. This is for instance one of the greatest attractions in the small German Universities. It would also seem probable that two rival schools would advance more rapidly and would do better work on account of the competition between them.

Possibly on account of my education in Germany I cannot even well imagine a Medical Educational Institution which does not embrace undergraduate and graduate instruction and research. A school without research cannot survive, but I also feel that it will hardly do to separate certain features of the research work from the rest. From the research worker the students get their best inspiration and the teaching of the fundamentals of his science may be troublesome to the advanced worker, still it is very good mental exercise which constantly drives him back to essentials. . . .

I am afraid also that an attempt of developing a great School of purely Medical Research on the Pacific Coast now might be a little premature. We have no unusual opportunities in Medicine here that would attract workers from other parts of the world, such as we have them in Biology, for example. We would have to start with our own men largely and they are hardly ready. We will have to develop them from our undergraduate students. This seems to me a strong reason why the beginning could be made more advantageous with undergraduate instruction.

Another difficulty which I see is this, that if an attempt is made to start with too few departments the research faculty might suffer seriously through their isolation. The most important results can only be expected through cooperation.

If the College should stop undergraduate instruction it will almost surely lose the most valuable part of its clinical and pathological material at the City and County Hospital, because the material is offered for the express purpose of instructing students.

The Johns Hopkins Hospital Medical School was started somewhat in the same way as you sugges - as a Research Institution. In that case the plan was feasible on account of the large endowment which was sufficient to cover the expenses for clinical material, excellent teachers and workers in the Clinical Departments. Apart from that there was enough left to run a first class Pathological Department. In our case the means would hardly suffice for such an undertaking.

*Very respectfully,
Wm. Ophüls*

"Dr. Jordan's attraction to the concept of "a graduate school of medical research" is traceable to the advice he received from Dr. Clarence J. Blake, Professor of Otology at Harvard. Dr. Jordan had consulted Dr. Blake as early as 1902 regarding the program to be developed on the premises of Cooper Medical College, should they be ceded to the University. In a letter to President Jordan dated 17 September 1902, Dr. Blake commented enthusiastically on the news that Stanford might fall heir to Cooper Medical College. He cited all the good reasons why proprietary schools like Cooper should be absorbed by universities like Stanford for the betterment of American medicine. He did not then propose establishing a graduate school of medical research in the Cooper facilities. That advice came later and was then, as we have seen, supported by President Jordan. [6]

Dr. Blake attended the Lawrence Scientific School at Harvard and then the Harvard Medical School where he received an M. D. degree in 1865. He was interested in diseases of the ear. Finding no place in the United States to take advanced training in this field, he studied under Dr. Politzer at the Vienna Krankenhaus. Although a busy clinician in Boston he was also active in research in his specialty. [7]

Dr. Blake cited no American graduate schools devoted exclusively medical research which could serve as successful examples of the type of program he strongly recommended for Cooper Medical College, nor did he take account of the state of development of medicine on the Pacific Coast, as did Dr. Ophüls. On the whole, Dr. Blake's advice seemed more theoretical than practical. In a letter to President Jordan on 18 March 1906, he summarized his visionary plan as follows: [8]

The plan I have in mind, and for the success of which there are, I believe, reasonable grounds, begins with the establishment, by your University, of a medical department, not of undergraduate instruction, but one devoted exclusively to the teaching of graduates in medicine and to medical research, and continues, by subsequent collaboration with the University of California, in the formation of a joint medical school, or department, insuring the command of medical education upon the Pacific Coast under university control.

The time for duplication of medical schools in this country has passed, and the demand for concentration, and for unification and advance, of educational standards, as part of the general University system, is imperative because of the rapid progress of medical education, along strictly scientific lines, and the correspondingly larger sociological opportunities of the medical profession.

In spite of Dr. Ophüls' championing of enhancement of the existing program at Cooper Medical College as the course to be followed after merger with Stanford, a position shared by Dr. Ray Lyman Wilbur, President Jordan continued to favor the plan outlined by Dr. Blake. On 2 May 1906, two weeks after the great earthquake and fire, the President made a report to the Stanford Trustees advising union with the Cooper Medical College on the basis of the Blake plan. [9] [10]

Later in the month (20 May 1906) Dr. Jordan wrote to Dr. Ophüls saying that he had advised the Trustees to adopt the (Blake) plan for a graduate school of medical research, but that the Directors of Cooper Medical College did not approve of the proposal: [11]"

20 May 1906

Dear Dr. Ophüls:

I have recommended to our Board of Trustees the acceptance of the Cooper Medical College property on condition that we could use it, at least for the present, as a school of medical

research. . . . Mr. Horace Davis, President of the Stanford Board of Trustees, tells me that the authorities of the Cooper Medical College do not approve. . . . The case then remains a matter of financial ability. . . . If it would result in crippling the instruction at Palo Alto, then it would be something we could not afford to undertake. . . . The action of the Board will probably depend upon the reports made by the Finance Committee when the matter is ready for final decision. . .
On 29 May 1906 Dr. Ophüls, who was vacationing in Brooklyn, New York at the time, responded as follows to President Jordan's letter of 20 May: [12]

Brooklyn , N. Y. , 29 May 1906

Dear President Jordan:

I received your kind letter of May 20th yesterday. I was glad to hear that you favor so strongly the proposed union of Cooper College with Stanford University. I still believe that even without any large endowment the University could develop a first class Medical School and an institution for Medical Research from the present assets of Cooper Medical College. As long as the spirit is the right one from the beginning, the scope of the work can easily be enlarged in the future as means become available. . .

Clearly without the persistence and leadership of Dr. Ophüls, Stanford Medical School could have proceeded down a very different pathway. That said, the debate and question of whether Stanford should be more of a research institute than a medical school has continued to the present era – with various champions and detractors. While there is no doubt that excellence in research is what distinguishes Stanford from its peers, we also recognize that it is the interconnection of our missions in education, research and patient care that will define our future.

The connection between research and clinical care was also a focus of attention when the medical school moved from San Francisco to the Palo Alto campus in 1959. This connection was forged by the design of the Stanford University Medical Center by the architect Edward Durell Stone. Here is the second coincidence. I admit to be a regular reader of the New York Review of Books (NYRB) and took note of the article by Martin Filler entitled “Behind the Screen” that offers commentary on a new book about ED Stone “*A Son’s Untold Story of a Legendary Architect*” by his son Hicks Stone (Rizolli, 2011). While the original medical school and hospital complex (referred to locally as the “Stone buildings”) did have the unique advantage of physically connecting the medical school and hospitals, there have been lots of reactions – and indeed emotional responses– to the façade of the buildings (even before their functionality became an issue).

As it turns out, the façade is a characteristic of nearly all of Stone’s work and is a source of not inconsiderable criticism. As noted in the NYRB, “Even architects who saw good qualities beneath the froufrou surface of Stone’s postwar work were exasperated by his constant reiteration of patterned screens” or “...what lay behind the grilles was not particularly interesting, and without those seductive peekaboo veils it became all too obvious that the exposed volumes of his unadorned work lacked both the raw power of Brutalism and the understated rigor of Minimalism, the two dominant architectural trends of the 1960s and 1970s. Stone’s simpler late-career structures, almost always clad in white masonry deployed vertical strips, exude the denuded and forlorn air of freshly shorn sheep.”

Today, now just over 50 years since the Stone complex was erected at Stanford, we look forward to the time when we can replace these buildings with more functional facilities – both in the New Stanford Hospital and in the Foundations in Medicine Buildings.

Clearly history has a way of reflecting both positively and negatively on individuals and institutions. We don't want to fall into the trap of being revisionist. But it is important to be cognizant of those who have changed our history in often untold ways (as is the case with Dr. Ophüls) or those whose history we are seeking to revise and replace over time. None of us escapes the critical impact of rear view vision – which is why we need to spend more time looking forward.

Assessing the U.S. International Competitiveness in Biomedical Research

I have written frequently about the importance of basic scientific research and its importance to our nation (see: http://deansnewsletter.stanford.edu/archive/11_15_11.html). In the February 21st issue of the Dean's Newsletter. I also reflected on the President's budget, the NIH budget and the Health of Nation's Investment in Science (http://deansnewsletter.stanford.edu/archive/02_20_12.html#4) – which is also the topic of an op-ed piece in the San Jose Mercury News (see: http://www.mercurynews.com/opinion/ci_19862392?IADID=Search-www.mercurynews.com-www.mercurynews.com). Beyond the US, the global impact of the decreasing support for biomedical research is well delineated in a new report entitled *"Leadership in Decline: Assessing U.S. International Competitiveness in Biomedical Research."* Published jointly by United for Medical Research and the Informational Technology and Innovation Foundation, the report, along with a related Congressional briefing, presents compelling data that the NIH funding stagnation and potential cuts due to sequestration are contributing to an erosion of our national lead in life sciences research. Data that other nations are expanding their research investments are also highlighted in the report. The authors of the report conclude that sequestration cuts would be a disaster for NIH and that Congress should aim to provide NIH with consistent funding at a level representing at least 0.25 percent of GDP. <http://tinyurl.com/6o9ynf8>. This is a report worth reviewing and I call it to your attention.

Stanford University Medical Center Alumni Association Celebrates 2012 Awardees

Stanford's reputation and success today are built on the accomplishments of its students and graduates of the past. In tandem, being recognized as a valued alumnus or alumna of one's alma mater is one of the most important honors and recognitions that can be achieved in life. Stanford Medical School has long recognized the accomplishments of its MD degree graduates through the JE Wallace Sterling "Muleshoe" Lifetime Achievement Award- first awarded in 1983. Appropriately, two years ago the Stanford Medical Center Alumni Association (SUMCAA) instituted the Arthur Kornberg and Paul Berg Lifetime Achievement Award in Biomedical Sciences. This was a timely and appropriate decision that aligned the School of Medicine with its historical connections as well as its mission. It was President Wallace Sterling who, with the University Trustees, made the decision in 1953 to relocate the medical school from its then home in San Francisco to the Stanford campus.

When the move to Palo Alto took place in 1959, among the very first faculty to be recruited to the new Stanford Medical Center was Dr. Arthur Kornberg, who founded the department of

Biochemistry and who brought with him a number of remarkable faculty members, including Paul Berg. In a number of important ways, it was the incredible accomplishments of Kornberg, Berg and the other remarkable faculty whom they helped recruit over the years that allowed Stanford to achieve its current level of distinction and recognition. Celebrating the Sterling Award in tandem with the Kornberg-Berg Award brings together our tradition of excellence in medicine and science. These missions are interlinked and thus so should our students and alumni be. We recognize and celebrate both. Just as the alumni were recognized for the lifetime contributions, it is wonderful that the student winners of the 2012 Student Research Day have been similarly recognized (see: <http://deansnewsletter.stanford.edu/#3>).

The 2012 winners of the JE Wallace Sterling “Muleshoe” Lifetime Alumni Achievement Award are:

- **Dr. Fernando Mendoza, MD’75, MPH**, is Professor of Pediatrics and Chief of the Division of General Pediatrics in the Department of Pediatrics. Dr. Mendoza joined the Stanford faculty in 1981 and since 1992 has served as the Principal Investigator of the US department of Health and Human Services Health Resources and Services Administration Center of Excellence grant. Through this and many other means, Dr. Mendoza has played a critical role in enhancing the diversity of Stanford Medicine and our community. He received the Distinguished Service Award from the Association of American Medical Colleges for his work on improving the diversity of our nation’s medical workforce. He has received numerous other awards and is a highly distinguished alumnus and leader.
- **Dr. Jose I. Santos, MSc, MD’76** is currently Professor and Head of the Infectious Diseases Unit in the Department of Experimental Medicine at the Facultad de Medicina, Universidad Nacional Autonoma de Mexico. Dr. Santos has been a national and international expert in child health and pediatric infectious diseases. He served as the director of Mexico’s National Infant and Adolescent Health and Immunization Program from 1997-2004. He then became the Director of the Hospital Infantil de Mexico Federico Gomez, the oldest and one of the foremost pediatric academic institutions in the Americas. Dr. Santos has had a broad and powerful impact on pediatrics and public health and is most deserving to be a Sterling Awardee.

The 2012 winners of the Arthur Kornberg and Paul Berg Lifetime Achievement Award in Biomedical Sciences are:

- **Dr. Fred Alt, PhD’77** is the Charles A. Janeway Professor of Pediatrics and Professor of Genetics at Harvard Medical School. Dr. Alt is an Investigator in the Howard Hughes Medical Institute and is President of the Immune Disease Institute and Director of the Program in Cellular and Molecular Therapy at the Children’s Hospital Boston. Dr. Alt’s distinguished career has focused on the mechanisms that generate and suppress genome instability in cancer and the role of gene rearrangements and mutations in the immune system. His work intersects cancer biology and immunology and has resulted in a number of seminal and important findings and contributions.
- **Dr. James Spudich, PhD’68** is the Douglass M. and Nola Leishman Professor in the Department of Biochemistry at Stanford. During his distinguished career he has

elucidated molecular motors, and his work has led to seminal findings that will impact the future treatment of muscle myopathies. In addition to being a world-renowned scientist, Dr. Spudich played a seminal role in the ideation and creation of BioX at Stanford. He also served as the past chair of the Departments of Biochemistry and of Structural Biology. He has won many important awards and accolades during his illustrious career.

Congratulations to Drs. Mendoza, Santos, Alt and Spudich for their distinguished contributions to medicine and science and for helping to bring distinction to Stanford Medicine.

Notable Events and Public Issues

- ***Ludwig Scientific Conference.*** On May 22-24th, Stanford hosted a scientific gathering and conference for national and international members of the Ludwig Institutes, Trust Centers (that include Stanford), Ludwig Professors and the scientific advisors and members of the Ludwig Foundation Board of Directors. Dr. Irv Weissman, Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine and the Virginia & D.K. Ludwig Professor in the department of Pathology and Professor of Developmental Biology and, by courtesy, of Biology, led the Conference and worked closely with Dr. Robert Strausberg, Ludwig Institute for Collaborative Research and Sciences, to make it a great event. Special thanks also go to Ms. Stephanie Witte, Senior Associate Director, and Joy Morimoto, Director of Corporate Relations and Foundation Relations, Office of Medical Center Development. This conference offered an excellent opportunity to share knowledge and discoveries and to create new interactions and collaborations between the Ludwig Foundation and its national and international partners and members.
- ***Tobacco and Health.*** In August 2007 the School of Medicine instituted policies to make its campus smoke free (see: http://deansnewsletter.stanford.edu/archive/07_09_07.html#6). The smoke free policies were extended across the Stanford University Medical Center in 2008 but have not yet been instituted across the university. Hopefully that day will come. In the meantime, tobacco use remains a major cause of morbidity and mortality in the US and around the world and remains an issue confused by debate and marketing. Teenagers, women and developing nations are major targets for marketing and are often the most susceptible to its impact. This story has been told from many different perspectives in the lay press, visual media, scientific journals and texts. The story of the tobacco industry has been critically delineated by Harvard Professor Allan Brandt in his 2007 book entitled *The Cigarette Century: "The Rise, Fall and Deadly Persistence of the Product that Defined America"* (published by Basic Books) and, more recently, by Stanford Professor Robert Proctor in his 2011 book entitled *"Golden Holocaust: Origins of the Cigarette and the Case for Abolition"* (published by the University of California press).

I recognize that these books, and others, tell a story that impugns the motivation of the tobacco industry – but the data supporting the adverse impacts of tobacco use on human health is unassailable. This has not halted the debate that continues to rage in the US and more recently in California as citizens prepare to go to the polls on June 5 to vote on a measure regarding tobacco and research. While I have personal opinions about the information being conveyed I will not share my own views in this newsletter – other than

to stress the need for critical thinking and assessment by each of us in the way information is shared and, importantly how the information that is presented is paid for. Clearly this is a time for critical reflection on how and what information is presented to us – which certainly is an issue that transcends tobacco per se but which also is exemplified by it.

- ***Best Pharmaceuticals for Children Act*** and the Pediatric Research Equity Act have played a critical role in assuring that pediatric research and also drugs and medications get to children that could be beneficial for the health. Special thanks goes to Congresswoman Anna Eshoo (D-CA), who first led this important effort in 1997 and who has recently introduced bipartisan legislation to reauthorize these programs. These have been successful and important programs, and we are appreciative for the leadership and advocacy of Congresswoman Eshoo.
- ***At the ICOC (Independent Citizens Oversight Committee) for CIRM (the California Institute for Regenerative Medicine)*** on May 24th, 21 Early Translational Awards were carefully reviewed and awarded. Of these, three Stanford faculty (Professors Helen Blau, Joseph Wu and Rene Reijo Pera) were among the awardees – see: <http://med.stanford.edu/ism/2012/may/CIRM.html>). With these new awards Stanford continues as the top-funded institution by CIRM, having received 68 awards and \$210,412,068 since funding began in 2006 (even though CIRM was approved by the legislature in November 2004). In addition to the review of awards, updates on the CIRM Strategic Plan were also given at the ICOC meeting – which are of critical importance given the prospect that CIRM will cease funding in 2017. It is amazing to witness the incredible contributions that have been made by faculty and institutions across California since the state first invested in stem cell research by voting for Proposition 71 in 2004. CIRM support has been transformative and has allowed this incredibly important research to move forward, making California the engine for discovery in stem cell biology and regenerative medicine and an economic resource for the state and our communities.

Notice of LKSC Closure on June 23

On Saturday, June 23, 2012, Stanford Hospital and Lucile Packard Children's Hospital will conduct an emergency exercise utilizing the ground floor of the Li Ka Shing Center for Learning and Knowledge (LKSC). Please note that LKSC will be closed to all non-exercise personnel from 6:00 am to 7:00 pm. This closure is applicable to all School of Medicine faculty, staff, students and visitors not participating in the exercise.

In addition to the LKSC closure, the L-15 parking lot south of LKSC on Campus Drive will be closed and reserved for emergency response vehicles from Stanford, Palo Alto and Santa Clara County from Friday, June 22 at 10:00 pm to Saturday, June 23rd at 7:00 pm.

We strongly recommend avoiding the areas near LKSC for the duration of the exercise. The impacted areas will be identified with caution tape and monitored by exercise volunteers.

If you have any questions regarding the emergency exercise at LKSC, please contact David Silberman, Director of the Health and Safety Programs Office, at silberman@stanford.edu or 650-723-6336.

The Visual Arts Service Center Comes to an End

I was asked to share the following announcement with you regarding the closing of the Visual Arts Center – which has been operating at Stanford since the Medical School first relocated to the Stanford campus. This is truly the end of an era – a part of broader transition in technology and information services. Here's the announcement.

It is with much sadness that we announce the end of an era. Due to intense pressure to create/carve out additional academic and research space on campus for the growing cadre of faculty, researchers, and academic programs, we have determined that the time has come to disband the Visual Arts Service Center effective Aug 31st, 2012. The space currently occupied by this Center in MSOB has been programmed for other purposes that via a domino effect similar to the relocation of other central Dean's units to offsite locations will allow for growth/consolidation of other key academic programs into that space.

Despite intense efforts to identify alternate locations for this service center both on and off campus, within the School and alternately as part of the central University, these many efforts did not prove successful. The additional reality is that as time passes and technology continues to evolve more and more of the Visual Arts services have become accessible and competitively so through external vendors. The historical archives of images maintained by Visual Arts Service Center will be transferred to another location, which will be announced at a later date.

Visual Art Services was organized in 1958 offering imaging services to Stanford. As new technology emerged, Visual Arts Services incorporated those new technologies into a comprehensive set of high quality services including Photography, Electronic Imaging, Graphic Art, Medical Illustration, Design, Printing support, Training programs and Workshops to the benefit of the entire University.

The Visual Art Services team consists of six talented and highly specialized individuals to whom we owe much appreciation for their many contributions to the School and University over these many years. Jim Taskett is the Director of Visual Art Services and has been working at Stanford University for over 30 years. Jim Day is the Business and Operations Manager and has been with Stanford for 28 years and in 2007, received the School of Medicine Dean's Spirit Award. Steve Gladfelter, Photographer, has been working at Stanford University for 25 years. Karen Johnson, Graphic Artist, has been working at Stanford University for over 20 years. MaryAnn Wijtman, Digital Imaging Specialist, has been working at Stanford for 20 years. John LeSchofs, Photographer, has been working at Stanford University for 19 years. To each we express our gratitude and best wishes as they explore other opportunities.

Although the Visual Art Service Center will cease operations at the end of this fiscal year, in the interim they remain open for business and are eager to continue to help you with your needs. The leadership of the Visual Arts Service Center in collaboration with Stanford University's Associate Vice President and Chief Procurement Officer are working diligently to identify alternate vendors and these will be announced at a later date. We recognize that by losing the expertise of the Visual Arts Service Center staff and thus requiring a transition to new vendors, it

will require additional forethought and planning on your part to ensure that you are able to obtain the highest quality result that will meet your needs.

Provost and Acting President Celebrates Faculty Receiving Major Awards in 2011-2012 Academic Year

On May 23, Provost and Acting President John Etchemendy held a reception at the Meyer-Buck House to acknowledge and celebrate university faculty who have won major academic awards and honors during the 2011-2012 academic year. Ultimately the success of an institution is measured by the accomplishments of the individuals who comprise it, and this is one of the areas where Stanford University clearly excels. In total 118 major faculty awards and honors were bestowed on university faculty, 41 of whom have primary appointments in the School of Medicine. While I have listed the majority of these awards and honors in past issues of the Dean's Newsletter, it is wonderful to be able to share them in the aggregate at this time. The medical school faculty who have received major awards, election to prestigious societies and other honors include (and are likely not limited to):

- **Dr. Arash Alizadeh**, Assistant Professor of Medicine (Oncology); *Doris Duke Clinical Scientist Development Award, Doris Duke Charitable Foundation*
- **Dr. Ann Arvin**, Vice Provost and Dean of Research, Lucile Salter Packard Professor of Pediatrics and Professor of Microbiology and Immunology; *Election to American Academy of Arts and Sciences*
- **Dr. Ben Barres**, Professor of Neurobiology, Developmental Biology and Neurology and Neurological Sciences and, by courtesy, of Ophthalmology; *Election to American Academy of Arts and Sciences; American Association for the Advancement of Science*
- **Dr. Philip Beachy**, The Ernest and Amelia Gallo Professor in the School of Medicine and Professor of Developmental Biology; *Keio Medical Science Prize, Keio University*
- **Dr. Kwabena Boahen**, Associate Professor of Bioengineering; *NIH Transformative Research Project Award*
- **Dr. Scott Boyd**, Assistant Professor of Pathology at the Stanford University Medical Center; *Ellison Medical Foundation New Scholar in Aging*
- **Dr. Anne Brunet**, Associate Professor of Genetics; *Vincent Cristofalo Rising Star Award in Aging Research, American Federation for Aging Research*
- **Dr. James Chang**, Professor of Surgery (Plastic & Reconstructive Surgery) at the PAVAHCS and, by courtesy, of Orthopaedic Surgery; *Andrew J. Weiland Medal for Outstanding Research in Hand Surgery, American Society for Surgery of the Hand*
- **Dr. Kenneth Cox**, Senior Associate Dean for Pediatric and Obstetric Clinical Affairs and Professor of Pediatrics at the Lucile Salter Packard Children's Hospital; *Salute to Excellence Award, American Liver Foundation*
- **Dr. Ronald Davis**, Professor of Biochemistry and Genetics; *Gruber Genetics Prize, The Peter and Patricia Gruber Foundation*
- **Dr. Karl Deisseroth**, Associate Professor of Bioengineering and of Psychiatry and Behavioral Sciences; *W. Alden Spencer Lecture and Award, Columbia University College of Physicians and Surgeons, Department of Neuroscience, Kavli Institute; Election to National Academy of Sciences*
- **Dr. Scott Delp**, Clark Professor in the School of Engineering and Professor of Bioengineering and, by courtesy, of Orthopaedic Surgery; *Borelli Award, American Society of Biomechanics*

- **Dr William Fowkes**, Professor of Medicine (Family and Community Medicine) at the San Jose Medical Center, Emeritus; *John W. Gardner Visionary Award, Pathways Hospice Foundation*
- **Dr. Michael Fredericson**, Professor of Orthopaedic Surgery at Stanford University Medical Center; *Psychiatric Association of Spine, Sports, and Occupational Rehabilitation (PASSOR) Legacy Award and Lectureship, American Academy of Physical Medicine and Rehabilitation*
- **Dr. Margaret Fuller**, Reed-Hodgson Professor in Human Biology and Professor of Genetics; *Election to Institute of Medicine*
- **Dr. K. Christopher Garcia**, Professor of Molecular and Cellular Physiology and of Structural Biology; *Election to National Academy of Sciences*
- **Dr. Stuart Goodman**, The Robert L. and Mary Ellenburg Professor in Surgery; *Election to College of Fellows, American Institute for Medical and Biological Engineering (AIMBE)*
- **Dr. Ralph Greco**, Johnson and Johnson Professor of Surgery; *John C. Gienapp Award, Accreditation Committee on Graduate Medical Education (ACGME)*
- **Dr. Geoffrey Gurtner**, Professor of Surgery at the Stanford University Medical Center and, by courtesy, of Materials Science and Engineering; *Award for Outstanding Achievement in Basic and Translational Research, Plastic Surgery Foundation*
- **Dr. Stuart Kim**, Professor of Developmental Biology and of Genetics and, by courtesy, of Chemical and Systems Biology, *Election to American Academy of Arts and Sciences*
- **Dr. Philip Lavori**, Professor of Health Research and Policy and, by courtesy, of Statistics; *Harvard Award in Psychiatric Epidemiology and Biostatistics*
- **Dr. Quynh Le**, Katharine Dexter McCormick and Stanley McCormick Memorial Professor and Professor, by courtesy, of Otolaryngology-Head and Neck Surgery; *Election to American College of Radiology (ACR)*
- **Dr. Michael Lin**, Assistant Professor of Pediatrics and Bioengineering; *Rita Allen Foundation Scholar*
- **Dr. Michael Longaker**, Deane P. and Louise Mitchell Professor in the School of Medicine and Professor, by courtesy, of Bioengineering and Materials Science and Engineering; *Flance-Karl Award, American Surgical Association*
- **Dr. Liqun Luo**, Professor of Biology; *Election to American Academy of Arts and Sciences; American Association for the Advancement of Science; National Academy of Sciences*
- **Dr. Michael Marmor**, Professor of Ophthalmology; *Award of Merit in Retina Research, The Retina Society*
- **Dr. Maxence Nachury**, Assistant Professor of Molecular and Cellular Physiology; *Early Career Life Scientist Award, American Society for Cell Biology*
- **Dr. Norbert Pelc**, Professor of Radiology and Bioengineering; *Election to National Academy Engineering*
- **Dr. Philip Pizzo**, Dean of the School of Medicine and The Carl and Elizabeth Naumann Professor of Pediatrics and of Microbiology and Immunology; *John Howland Medal, American Pediatric Society*
- **Dr. John Pringle**, Professor of Genetics; *American Association for the Advancement of Science*
- **Dr. Joseph Puglisi**, Professor of Structural Biology; *NIH Transformative Research Project Award*

- **Dr. David Relman**, Thomas C. and Joan M. Merigan Professor and Professor of Microbiology and Immunology; *Election to Institute of Medicine*
- **Dr. J. Kenneth Salisbury**, Professor (Research) of Computer Science and of Surgery and, by courtesy, of Mechanical Engineering; *Inaba Technical Award for Innovation Leading to Production, Institute of Electrical and Electronics Engineers Robotics and Automation Society (IEEE RAS)*
- **Dr. David Schneider**, Associate Professor of Microbiology and Immunology; *NIH Director's Pioneer Award*
- **Dr. Carla Shatz**, Sapp Family Provostial Professor and Director, Bio-X and Professor of Biology and Neurobiology; *Election, Foreign Member, Royal Society*
- **Dr. Justin Sonnenburg**, Assistant Professor of Microbiology and Immunology; *Investigators in the Pathogenesis of Infectious Disease Award, Burroughs Wellcome Fund*
- **Dr James Spudich**, Douglass M. and Nola Leishman Professor of Cardiovascular Disease Wiley; *Wiley Prize in Biomedical Sciences, Wiley Foundation*
- **Dr. David Stevenson**, Vice Dean and Senior Associate and Dean for Academic Affairs, the Harold K. Faber Professor of Pediatrics and Professor, by courtesy, of Obstetrics and Gynecology; *Jonas Salk Award for Leadership in Prematurity Prevention, March of Dimes*
- **Dr. Robert Tibshirani**, Professor of Health Research and Policy (Biostatistics) and of Statistics; *Election to National Academy of Sciences*
- **Dr. Abraham Verghese**, Professor of Medicine; *Election to Institute of Medicine*
- **Dr. Fan Yang**, Assistant Professor of Orthopaedic Surgery and Bioengineering; *2011 "35 Innovators Under 35" list, MIT's Technology Review*

Congratulations to each of these individuals and apologies to anyone who was not included in this list. These are very impressive accomplishments.

Awards and Honors

The following were among the winners of the Burroughs-Wellcome Fund Career Awards at the Scientific Interface for 2012:

- **Kwanghun Chung, Ph.D.**, Post Doctoral Scholar, Neurobiology
- **Maureen E. Hillenmeyer, Ph.D.**, Post Doctoral Scholar, Biochemistry
- **Heather J. Kulik, Ph.D.**, Post Doctoral Scholar, Chemistry

Appointments and Promotions

Oliver O. Aalami has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 6/1/2012.

Sheena K. Aurora has been appointed to Clinical Associate Professor of Neurology & Neurological Sciences, effective 8/1/2012.

Michael W. Brook has been reappointed to Clinical Assistant Professor of Anesthesia, effective 4/16/2012.

Stéphan Busque has been promoted to Professor of Surgery at the Stanford University Medical Center, effective 4/01/12.

Kiki D. Chang has been promoted to Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 4/01/12.

Stephen D. Coleman has been reappointed to Clinical Assistant Professor of Anesthesia, effective 7/1/2012.

Sarah A. Copeland has been appointed to Clinical Assistant Professor (Affiliated) of Neurology & Neurological Sciences, effective 5/1/2012.

Alexis Davis has been appointed to Clinical Assistant Professor of Pediatrics, effective 7/1/2012.

John Day has been appointed to Professor of Neurology at the Stanford University Medical Center, effective 4/01/2012.

Anthony R. Dubose has been appointed to Clinical Associate Professor of Medicine, effective 6/1/2012.

Sarah Eitzman has been reappointed to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 9/1/2011

Julie Fuchs has been promoted to Clinical Associate Professor of Surgery, effective 6/1/2012.

Neville Golden has been reappointed to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 4/01/12.

Neelam Goyal has been appointed to Clinical Assistant Professor of Neurology & Neurological Sciences, effective 9/1/2012.

Paul C. Grimm has been reappointed to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 4/01/12.

Scott A. Hoffinger has been appointed to Clinical Associate Professor of Orthopaedic Surgery, effective 5/1/2012.

Lynne C. Huffman has been appointed to Associate Professor (Teaching) of Pediatrics, effective 5/01/12.

Reza Kafi has been reappointed to Clinical Assistant Professor (Affiliated) of Dermatology, effective 3/1/2012.

Laura Lazzeroni has been reappointed to Associate Professor (Research) of Psychiatry and Behavioral Sciences, effective 10/01/12.

Scheherezade Le has been appointed to Clinical Assistant Professor of Neurology & Neurological Sciences, effective 11/1/2012.

Jason T. Lee has been promoted to Associate Professor of Surgery at the Stanford University Medical Center, effective 4/01/12.

Nicholas Leeper has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 4/01/12.

Albert Lin has been promoted to Clinical Professor (Affiliated) of Medicine, effective 6/1/2012.

Sami Mazbar has been reappointed to Clinical Associate Professor (Affiliated) of Medicine, effective 9/1/2012.

Philippe Mourrain has been appointed to Associate Professor (Research) of Psychiatry and Behavioral Sciences, effective 5/01/12.

Nirav K. Pandya has been appointed to Clinical Assistant Professor of Orthopaedic Surgery, effective 5/1/2012.

Bina Pulkit Patel has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 6/1/2012.

James F. Policy has been appointed to Clinical Assistant Professor of Orthopaedic Surgery, effective 5/1/2012.

Peter Poulos has been promoted to Clinical Assistant Professor of Radiology and Medicine, effective 6/1/2012.

John Ratliff has been appointed to Associate Professor of Neurosurgery at the Stanford University Medical Center, effective 4/01/12.

Cybele Renault has been reappointed to Clinical Assistant Professor of Medicine, effective 6/1/2012.

Kerri Rieger has been appointed to Clinical Assistant Professor of pathology and Dermatology, effective 7/1/2012.

Hamed Sajjadi has been reappointed to Clinical Associate Professor (Affiliated) of Otolaryngology – Head & Neck Surgery, effective 5/1/2012.

Avni Shah has been promoted to Clinical Assistant Professor of Pediatrics, effective 6/1/2012.

Simran Singh has been reappointed to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 9/1/2011

Robert Steele has been appointed to Clinical Associate Professor of Surgery, effective 5/16/2012.

Xinnan Wang has been appointed to Assistant Professor of Neurosurgery, effective 5/01/12.

Vasyl Warvariv has been promoted to Clinical Associate Professor of Medicine, effective 7/1/2012.

Dean Winslow has been reappointed to Clinical Professor (Affiliated) of Medicine and Pediatrics, effective 9/1/2011

Phillip C. Yang has been promoted to Associate Professor of Medicine at the Stanford University Medical Center, effective 4/01/12.

Roham T. Zamanian has been reappointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 7/01/12.

Karl Zheng has been promoted to Clinical Assistant Professor of Anesthesia, effective 6/1/2012.

Dean's Newsletter

June 20, 2012

Commencement 2012

The Stanford University School of Medicine was founded in 1908 when the Cooper Medical College became part of Stanford University – a topic I featured in my May 29, 2012 Dean's Newsletter (see: <http://deansnewsletter.stanford.edu/#2>). Based on the history recorded by Dr. John Wilson (<http://elane.stanford.edu/wilson/index.html>), 1912 marked the last class to receive a degree from Cooper Medical College, and those graduating in 1913 were the first class of Stanford University's Department of Medicine. A hundred years later, on Saturday, June 16th, we celebrated the graduation of 212 students, 52 receiving Master of Science degrees, 85 Doctor of Philosophy degrees, 75 Doctor of Medicine (13 medical students also received a PhD degree and 2 received a MS degree). Although the temperature was truly "hot" during our Medical School Commencement ceremony under the large tent on Alumni Green, surrounded by the Clark Center, Fairchild Science Building, Li Ka Shing Center for Learning and Knowledge, and the Lorry Lokey Stem Cell Science Building, the celebratory feelings of our graduates and their families, colleagues and friends were even warmer. While the majority of students have spent about 5 years at Stanford, a few have been on their degree path for up to 10 years – giving new meaning to graduation!

The excitement of our graduates is inversely matched by the uncertainty of the times: a challenged economy both in the US and globally as well as uncertainty about the future of US healthcare (with the decision from the Supreme Court about the constitutional legality of the Affordable Care Act expected with the next couple of weeks and the political contest of healthcare reform likely to be among the center stage issues in the upcoming presidential debates and election this November). More certain but of deep concern is the flat to declining funding for research from the NIH and other federal agencies and the impact this might have on our

investment and even prominence in being world leaders in the biosciences. Clearly our graduates will face new and uncharted waters, although it is our hope that they have been well educated and trained for a new world order. The wonderful thing about the Stanford community is that challenges are nearly always reframed as opportunities – and I am confident that this will be the case for our new graduates. Indeed, it is our hope that they will also lead the transformation of healthcare and science into the future – both of which will have a positive impact on the economy of our nation as well.

I have made it a tradition to have the Newsletter following commencement include the names of our graduates as well as the texts of our student and commencement speakers. I am grateful to each of them for providing an important and unique perspective that was both personal and generalizable. Please also join me in thanking the many individuals who worked unstintingly to make this year's commencement so successful – especially given the exceptionally hot weather conditions. As she has in each of the past 12 graduation ceremonies that I have had the pleasure to participate in, Ms. Zera Murphy, Director of Student Life, worked tirelessly and devotedly to make sure every detail was addressed and achieved. I also want to thank Ms. Char Hamada, Assistant Dean of Student Affairs and Director of Admissions, and the other wonderful professionals from the Office of Education Programs and Services and the Dean's Office for their exceptional contributions to this year's Medical School Commencement.

This year we also had the special privilege of sharing the commencement activities with Dr. Jose Sandoval and his family. As noted in Jonathan Rabinovitz's report on graduation day (see: <http://med.stanford.edu/ism/2012/june/graduation-0617.html>), Dr. Sandoval's family was unable to attend his graduation so he missed it entirely in 1977. He returned in 2012 to march with the class of 2012, which was also a wonderful thing to celebrate.

For those who missed it, I had the opportunity to present our candidates to President Hennessy for the granting of their degrees at the University Commencement on Sunday June 17th. The University Commencement Address was given by Cory Booker, currently Mayor of Newark, New Jersey and a Stanford alum (see: <http://news.stanford.edu/news/2012/june/commencement-cory-booker-061712.html>). Without question Mayor Booker's address was one of the most moving and meaningful commencement speeches I have ever heard and its message is deeply relevant. I would encourage you to watch it if you have not already done so (see <http://thenextweb.com/shareables/2012/06/18/watch-mayor-cory-bookers-stanford-commencement-speech-it-will-inspire-you/>). It is quite special and truly inspiring.

Student Speeches

A tradition at the School of Medicine Commencement is to hear comments from a graduating PhD student and graduating MD student who have been elected by their classmates. I am pleased to share their comments with you:

Remarks from Graduate Student Speaker - Moria Chambers, PhD Candidate in Microbiology and Immunology: Moria is a graduate of MIT and did her PhD work in Dr. David Schneider's Lab in the Department of Microbiology and Immunology. She is also the Past President and Mentorship Chair of the Stanford Biosciences Student Association (SBSA).

Thank you Dean Pizzo.

Graduates, I want each of you to look around and find someone who's supported you during the adventure that is graduate school - maybe you're looking at an academic adviser, a parent, an administrator or fellow student; and the people here today are probably just a small fraction of your support network. Collectively they refined our scientific thinking, took us out after an experiment flopped, and lent a listening ear. Take a moment and send them a silent thanks. They are so proud of you here today.

Now, some of you having been working for this and looking forward to this day for over five years, myself included. Not wanting to extend that by much more time today, I'll be brief. I have just two missions for you.

First - I'm asking for each of you to commit yourselves to being a life-long mentor. Some try to reserve the word "mentor" for those esteemed faculty that sponsor our dissertation research and sit on our committees; however, I believe that any motivated and caring person can mentor a graduate student. Let's retake the word mentor; that includes those of you going into biotech start-ups or public policy - you're not off the hook! The skills developed here at Stanford are launching us into a wide range of careers from improving water sanitation in Africa, to researching the next Lipitor, to rewriting science policy in DC. The education of future students will be greatly enhanced if we, as alums, lend our collective experience and support. Each of you have and will continue to have so much to share with future students.

So, make yourself accessible to current students online. If you're visiting the bay area, contact our student groups and offer to talk about your experiences! Believe me, they'll take you up on it. More broadly though, your responsibility isn't just to the wonderfully privileged students here at Stanford. Wherever you call home, think about reaching out to the local university, high schools and elementary schools. As a Stanford alum, you have the ability to both inspire and support the young scientists of this world. It is not enough to leave mentoring to others. In a world that demands high levels of efficiency and doesn't guarantee job stability, it may seem like a lot to ask, but future generations will thank you for this commitment. You might even find it personally rewarding.

Now onto my second and more immediate mission. I want each and every one of you to truly revel in what you've achieved. That's right - revel - celebrate the magnitude of what you've accomplished. Graduate school is a "choose your own adventure" and your adventure is unique and incomparable. Take the weekend off, take lots of pictures, party with family and friends and let yourself enjoy this finale. If you're like me, and still have papers waiting to be finished; forget about it for a couple of days. It's not going anywhere. This is your graduation, and it is well earned.

Thank you.

Remarks from Medical Student Speaker – Krishnan Subrahmanian did his undergraduate studies at Harvard and also received a MPhil in education from Cambridge University as a Gates Scholar. With his graduation he will begin a training program in Global Pediatrics at the Texas Children's Hospital and the Baylor International Pediatric AIDS Initiative.

Dean Pizzo, Dean Prober, Esteemed guest Dr. Hamburg, Dr. Salvatierra, Dr. Knox, Dr. Blaschke, Dr. Gesunheidt, Dr. Scholl's, Dr. Seuss, Dr. Pepper, Dr. Phil, Dr. Zaius, Dr. Octopus,

Dr. Oz, Dr. J, Dr. Drew, Dr. Dre. Dr. Quinn...Medicine Woman, ladies, gentlemen, friends, family and the newest doctors. The Stanford School of Medicine Class of 2012.

I stand before you with more debt than Greece, unable to afford redundant luxuries like pants underneath an expensive graduation robe, yet so grateful to bear witness to a transformation. For many of you this has been a long haul. Decades of study. Mike Mancuso and Matt Goldstein have been students here since the Ford Administration. It is a big day for them and many of our physician-scientists because not only do they get an MD and a PhD today, they also get to enroll in Medicare and collect social security. Whatever decade we started, we were asked to go into a room and interview a patient for the first time about a serious medical complaint. We were humbled by the tears and pain in that room and when it was over, the patient stood up, gave us a hug and said "Please stop crying. You're going to be a fine doctor...one day". Unsure of what to do, many of us spent our fifteen minutes in idle banter, where are you from? What do you do for a living? Do you come here often? Men, women or both?" All things you would hear at any local single's bar. Because we are all medical students, I assure you this was thoroughly awkward.

Years later, a lot has changed. You know, back when we started medical school we used a substance called paper and now, the kids use their fancy iPads and Angry Birds. When we started medical school, the building was made of cardboard, asbestos and lead and now it is made of platinum and powered by the strength of unicorns. In the spirit of student feedback and animal experimentation our class was guinea-pig to a new grading system. Over the years this has been tweaked and I'm excited to introduce to you today, the newest grading system at this distinguished institution. The top grade is now a smiley face representing "pass-with distinction but stay away from the patients." Next is a face that can neither smile nor frown. This means the student self-injected too much Botox. Finally, frowny face means "Your doctor does not play nice with others. Consider a career in pathology. At Harvard."

The greatest transformation of course, has been in the people gathered here, soon to be minted physicians and scientists. My classmates are an incredible group. We have published authors, and produced professional athletes. Last year seven Stanford medical students founded companies, three founded their own medical schools and four founded their own religions. Incredibly, two students last year learned how to take a blood pressure.

What makes my classmates incredible is not their accomplishments, it is their choice to care day after day. Graduations rarely celebrate the choice of compassion. From preschool to college we've been praised for talent and work. In medicine however, every day we bring our talents, work hard and yet we often, along with our patients, bow down in front of luck. A horrible accident, an aberrant cell. And we realize that while we may be talented, we are just really blessed. With the good health to be here. With the resources and support to be here. Lucky to be educated people in the most influential country in the most connected world ever. Nobody has had greater choice in the great and horrible things they could do. Talented people after all chose to start the sub-prime crisis and MTV's "Jersey Shore." The talents we possess are rather arbitrary. The choices we make are not. What we choose to make our lives about. How we treat others.

Our politicians, society and even alma mater will grant us access and privilege based on our proximity to capital. Yet in the tradition of great caregivers from mothers to teachers to nurses to good friends who listen, you have chosen, instead proximity to people. You researched and knew everything about a disease for rounds but in moments and gestures no one will ever know about,

you showed your patients that this disease was the least interesting thing about them. Your hands welcomed new life into the world and held on through last breathes. Your choice to spend your lives in service, caring for my parents. Our sisters and brothers. Today we celebrate your decision to confront suffering and especially celebrate those people who have chosen to spend their lives showing us how to care.

Administration, Faculty, Staff. The good news for you is that according to the original Hippocratic Oath, you as our teachers are entitled to a sum of our earnings from here on and I am to regard you and your children as family. The bad news for you is that I will now regard you and your children as family. Dear Uncle Dean Pizzo, I will be sleeping on your couch starting Tuesday. Dear Uncle Dean Prober, I need two-hundred thousand dollars and a pair of pants. We thank you for in your role as caregivers, in your role as educators and in your role as people, you always exemplified a life of care and love. You were there and caught us when we fell. Seriously, one of my classmates was in the operating room and just after the nine-hour surgery wrapped up, she began to feel light-headed and fell backwards into the arms of world famous surgeon Dr. Jeffrey Norton. With the efficiency of a surgeon he declared "Give her some room, get her some juice." When she went to apologize for the incident he promptly told her "You're an angel, you retracted perfectly." Again and again, this staff and faculty chose to care for us.

Our families, defined by blood, experience and love have cared for us, even when we didn't earn it. I learned in medical school that I owe a lot to my parents, namely a very bad lipid profile and nightmares about male patterned baldness. My mom once left me a voicemail and because I was a 'very busy' med student, it sat unlistened to for days. I proceeded to work a 30 hour shift and had a great post-call nap. I woke up to a loud knock at the door and found a very friendly Stanford police officer who had received a call from a very angry Indian woman. It is truly an act of care when your family will call the police on you. Worried hours by the phone and extra jobs so we could afford school. Gift baskets full of Twizzlers and journeys across the oceans more opportunities. Families, we thank you and we hope to honor your sacrifices by allowing a fraction of the love and grace you have shown us to be gifted to those in their moment of need.

That this community has transformed awkward medical students into equally awkward physicians is remarkable. As we embark on a life of caregiving, we ask you to remind us, and I remind myself that in order to care for others, we must care for ourselves. Unconditionally. We have all seen doctors, even predecessors from these seats, who were sad, frustrated. We work in a world and live in a field that, that sometimes tells us that we are good and valuable mostly due to a title, a rank, an honor or a Stanford degree. Let us not celebrate our accomplishment alone today for what when the accomplishments end or when they fail to satisfy? When we don't get this fellowship or grant? When everyone on Facebook has a bigger house, prettier baby, and a Nobel Prize. Our faith and this community remind us that it isn't our successes that make us great or construct our identity. Let us celebrate us today and every day, instead for reasons celebrate this work. The reasons we celebrate every patient. Our relationships. Our humanity. Our presence in this brief moment.

Classmates I hope we do continue to cure disease, solve problems and help create a world of deeper knowledge, greater justice and better health. But more importantly, I wish for us lives filled with care, joy and great relationships. Not as an abdication of the responsibility to improve the world, but as a recognition that maybe improving the world begins right there with care, joy and great relationships. I hope you have terrific conversations with patients, mentors and colleagues. I hope you have enough time with your family, friends and loved ones to enjoy

them. And more time, such that you find them boring. And still more time such that you find them annoying. I hope you have great conversations with yourself. But not so loud that other people get scared. I mostly hope you live out the moments and the life for yourself that you will fight so deeply to preserve for others. To the graduates and to this community of Care. I'm humbled by you and your ridiculous good looks. I thank you. I wish you all wonderfully mediocre careers and phenomenal, joyful lives.

Commencement Address by Dr. Margaret Hamburg, Commissioner of Food and Drug Administration.

Dr. Margaret Hamburg literally grew up on the Stanford campus. Her parents, David and Beatrix Hamburg, were pioneers in Psychiatry and Mental Health. David Hamburg was the first chair of Psychiatry when Stanford Medical School relocated to Palo Alto, and he also played founding role in the Human Biology Program. Margaret Hamburg left Stanford after high school to attend the “Stanford of the East,” doing her undergraduate work and medical school education at Harvard University. Following Residency in Internal Medicine at New York Hospital and the Weil-Cornell School of Medicine, she did research in neurosciences at the Rockefeller University. With the onset of HIV/AIDS she joined the National Institute of Allergy and Infectious Diseases at NIH as Assistant Director. Her work in public service continued when she was named the Commissioner of Health for New York City, where her impact on transmission of HIV infection and the control of multi-resistant tuberculosis won national acclaim. She was appointed by President Clinton as Assistant Secretary for Planning and Evaluation, a position she held through the end of the Clinton Presidency. She then served as the Vice President for the Biological Program at the Nuclear Threat Initiative until she was tapped by President Barack Obama on May 18, 2007 to become the 21st Commissioner of the Food and Drug Administration. She is the second woman to serve as Commissioner of the FDA. I have had the honor and privilege of knowing Dr. Hamburg for over 20 years and stand in awe of her incredible accomplishments and leadership. We are proud to have her as our 2012 Commencement Speaker.

Dean Pizzo, trustees, distinguished faculty, parents, families, and friends - thank you for inviting me to participate in this wonderful celebration. I join all of you in congratulating the outstanding 2012 graduates of the Stanford University School of Medicine.

Whether you are receiving an MD, Ph.D, Master's Degree, or a combined degree - you are graduating from an extraordinary institution...and you are poised to do extraordinary things.

As a daughter of Stanford, I admit to some bias, but there are few medical schools, anywhere, that offer the education and training that you have received. The dedication of Stanford's faculty, the caliber of the teaching, the importance of its research, the quality of patient care and the effectiveness of its leadership have earned Stanford Medical School enormous respect and admiration, and secured its position as one of the leading medical institutions in the world.

And for the Class of 2012, *you* too deserve respect and admiration. You have clearly succeeded—even excelled- in this exceptionally dynamic and demanding academic environment. As I look out from this podium, I know that for decades to come you will save lives, solve medical mysteries, and invent technological wonders - building on what you have learned and accomplished here.

There is an old saying that it is better to be lucky than good. True or not, there is certainly a lot of serendipity in life. But Louis Pasteur had a different take. He said, "Chance favors the prepared mind." I was reminded of this every day while serving as New York City Health Commissioner because the quote was inscribed on a wall in our lobby.

But you don't need a reminder. You are already far better prepared than most. And you now belong to a very elite group that has the tools and training to improve the lives of so many... whether it is through research, or medicine, or public service. What you do will matter.

So on behalf of those whose lives you have already touched with your medical and research skills - and will touch in the years ahead - I say: Thank you for working so hard - and preparing so well!

And now I'd like to suggest that you also say - thank you.

First and foremost, thank your families. They've stood by you. They've supported you. And today they share your joy, excitement and pride.

Thank your professors - the faculty and staff who put so much time and effort into teaching you, guiding you, inspiring you, and sometimes prodding you.

And thank each other too - because you never would have reached this auspicious day without the friendship, support, and collaboration of your colleagues.

For many years, Stanford was my home. I lived right on campus where both of my parents were on the Medical School Faculty. Growing up, I was immersed in medicine and science. My parents were physicians and researchers. So were most of my friends' parents. It was the life I saw every day - and it looked fun, exciting and rewarding.

I went to college wanting to be a doctor, but when I got there, I discovered that premed courses weren't so fun and there were plenty of other interesting things to do in life. I got involved with the school newspaper, and for a while considered a career in journalism.

My father now refers to this as the period when I was "drifting." But eventually the "prodigal daughter" saw the light and came around. And when I was admitted to medical school, my Great Aunt Winnie - who was like a grandmother to me - exclaimed "Oh sweetie, I'm so happy - now finally you can marry a doctor!" I did not.

And back then, I was absolutely not planning on a career in government or public service...I wanted to be an academic physician engaged in research, teaching and clinical practice. But that old Yiddish saying is true: People plan and God laughs.

For me, my path took a dramatic turn as I watched the HIV/AIDS epidemic emerge. As first year medical school students, we had been told that with the advent of antibiotics and vaccines, medicine was on the verge of ending the era of infectious diseases.

How wrong that was. Soon cases of a mysterious immune deficiency syndrome began to present. No one knew what caused it. No one knew how to care for it. No one even knew what to call it. But it was AIDS.

By the time I was an intern in New York City, I was taking care of a great many AIDS patients. Even one of my fellow interns was lost to this devastating disease. But we had no effective treatments and no medicine on the horizon. We could offer neither a cure nor hope. For a newly-minted, idealistic doctor like me - that was humbling.

Those early days of AIDS brought many lessons. The AIDS epidemic opened my eyes to the importance of research and global health. It opened my eyes to the need for strategic thinking - and an integrated health care system that harnesses the full continuum of science, medicine and public health. And it opened my eyes to the fact that some of the greatest challenges in medicine exist at the interface of a broader set of social, ethical, political and legal concerns.

The AIDS crisis propelled me into the world of public health and health policy. And yes, this terrible disease opened my eyes, but it also opened a door - the unexpected opportunity to become the New York City Health Commissioner.

My first reaction was: "This crazy! I'm not qualified." Frankly, I was scared. My Aunt Winnie was not altogether happy either. "You will be throwing away the chance - after so many years of training - to be a 'real doctor'," she admonished. My father tried to calm her down, explaining that I would still be a real doctor - but instead of having one patient at time, I would have 8 million. Now, as FDA Commissioner, I guess I have more than 300 million.

I am telling you this because when I sat where you are sitting today, I had no idea that I would one day end up in any of these jobs. Your future will definitely hold many opportunities. You've guaranteed that with the degree you are getting and all your hard work. But what path you choose will be neither obvious nor easy, nor without risk

So be open to and enthusiastically seize new opportunities, wherever and however you find them. Let chance favor your prepared minds...and make sure that you translate your ideas and opportunities into real world action. Even when the path is hard.

When I began as New York City Health Commissioner, the City was facing a fiscal crisis and budgets were being slashed. New York City was not only an epicenter for HIV/AIDS, but we were struggling to deal with the resurgence of tuberculosis in epidemic proportions, and now in a more dangerous and harder-to-treat drug-resistant form. Communities in the city had health statistics that looked more like those of developing countries, and we faced a new threat—domestic terrorism—that required that us to think in new ways about what it means to protect health.

I felt unprepared for so many problems, big and small. Whether it was how to ensure that thousands of TB patients scattered around the city—many of whom were homeless, drug-addicted, or had multiple concurrent medical and social maladies—took their medications reliably for months on end so that they would be adequately treated and in order to prevent further development of drug resistant strains... or how, after a young boy had been bitten by a possibly rabid raccoon, to transport the raccoon's brain up to the only rabies testing lab which was up in Albany when the only employees authorized to transport biological materials were out on strike.

Nothing in my medical school curriculum prepared me with the answers. But we found them: For TB, we sent healthcare workers into homes and under bridges or wherever needed, to make sure that patients took their medicine until cured; and for the raccoon brain, an igloo cooler, a car service, and a willingness to skirt a few rules did the job...and possibly saved a boy's life.

My experience as health commissioner was perhaps the best preparation for my job at the FDA. I entered this role in the midst of similar challenging circumstances. Economic uncertainty, budget constraints, mistrust in regulation, and concern about the future of health care overall.

But to be honest, when I agreed to lead this enormous agency, I did not fully appreciate the scope of the job. As you may or may not know, the FDA regulates drugs, medical devices, vaccines and biologics, the safety of our nation's food supply, blood supply, cosmetics, dietary supplements, and most recently tobacco. FDA regulated products account for over 20-cents of every dollar that consumers spend on products, and they represent things that people really care about—often in life-saving ways.

As an agency, we have to make hard decisions every day - and almost every decision leaves many people unhappy. But as I have learned, especially in the face of complex scientific and sociopolitical challenges, the only way for the FDA to stay on course is to be open, responsive and accountable; have a clear and consistent framework for decision making; weigh risks and benefits carefully; and - above all - ground our decisions in the best-available science.

No matter what you do, I think this is good advice for all.

As future doctors, scientists, and public health officials - much will be expected of you. I urge you to recognize that with your training -and your new titles-comes a broader responsibility.

The poet William Butler Yeats wrote, "Though the leaves are many, the root is one." I hope each of you will always remember that while the leaves of medicine are many, the root is one . . .and that is the imperative to advance human health for all.

Whether you are treating individual patients *as* a practicing physician; delving into the mysteries of life *as* a bench scientist; learning which therapies work best for which diseases *as* a clinical researcher; or addressing the broader issues of public health and health policy *as* a government official- you have the opportunity and responsibility to be part of a whole that's greater than yourselves.

Be willing to work across disciplines, across sectors, across borders. Be willing to work with all those who have a stake in what you are doing or a perspective to offer. I know that this philosophy of productive collaboration is embedded in Stanford's education, research and patient care mission. I hope that you have embraced it and that you will live it in earnest. And why? Because the complexity and urgency of the problems before us demands it.

AIDS is now a chronic, manageable disease—not a life-sentence- because the entire system worked together...from patients and their loved ones who advocated for their needs, to AIDS workers who walked the streets giving out accurate information and urging people to be tested, to doctors in clinics and hospitals who provided care and studied the disease, to dedicated and brilliant researchers in academic, government and private labs who made crucial discoveries about the nature of the disease and how to treat it.

The practice of medicine - and biomedical research - has never been more promising, more exciting, and more fulfilling. From sequencing the human genome, to eradicating small pox, to curing some deadly cancers, to effectively treating HIV infection, much of what is possible today was only a hope when I began medical school. Huge progress has been made. But there is so much more to be done.

So never stop learning; never stop asking questions; and never forget that medicine is an art as well as a science practiced by doctors and researchers who bring to the bedside - and to the bench - not only technology and training, but also their humanity, caring, and concern.

Patients do not put their trust in machines or devices. They put their trust in you. You have already spent years studying, training, doing research and seeing patients. And you likely have many more years of education before you.

But please remember that the more skilled you become, the more specialized you become, and the more dependent on technology you become - the easier it becomes to lose your humanity, forget your compassion, and ignore your instincts.

I have one last piece of advice: never, ever lose your moral compass.

AIDS was a crucible event that changed my career path - and my life's mission. Watching AIDS destroy so many led me to public service where I have had the opportunity to treat not just individual patients, but whole neighborhoods, communities, and populations.

You came of age under the shadow of a different crucible of events: 9/11; a bioterrorist attack; two wars; a flu pandemic; the worst recession since the 1930s; a widening gap between rich and poor; and the specter of everything from unsustainable growth in health care costs, to a widening gap between rich and poor, an aging population, growing conflict in many parts of the world, newly emerging biological threats—both naturally occurring and deliberately caused, global warming... and I'm afraid the list goes on.

I hope you will take advantage of these challenging times to strengthen *your* moral compass - by directing your energies and talents to doing good, not just doing well; that you will combine the knowledge and skills you've gained here at Stanford with the courage of your convictions...to be great doctors and scientists, to speak for those in need or underserved; to advance science in the service of humanity, and to make sure you hand the next generation of doctors and scientists an even more innovative, responsive, curative and preventive health care system than the one that was handed to you.

But all of that is about tomorrow. Today is about you - your joy, your pride, your achievements, and your well-deserved celebration. I offer you all my best wishes for your success and happiness.

Congratulations Class of 2012 - and good luck.

Teaching Awards to Faculty and Residents

The Arthur L Bloomfield Award In Recognition of Excellence in the Teaching of Clinical Medicine

- **Maha Mahadevan, MD**, Associate Professor, Emergency Medicine
- **Keith Posley, MD**, Clinical Assistant Professor, Medicine
- **Roland Torres, MD**, Clinical Associate Professor, Neurosurgery

The Alwin C Rambar-James B D Mark Award for Excellence in Patient Care

- **Paul Mohabir, MD** – Clinical Associate Professor, Medicine – Pulmonary and Critical Care Medicine

The Franklin G Ebaugh, Jr. Award for Advising Medical Students

- **Erika Schillinger, MD**, *Clinical Associate Professor, Internal Medicine*

The Henry J Kaiser Family Foundation Award for Outstanding and Innovative Contributions to Medical Education

- **Madelyn Kahana, MD**, *Professor, Pediatrics and Anesthesia*

The Henry J Kaiser Family Foundation Award for Excellence in Preclinical Teaching

- **Vivek Bhalla MD**, *Assistant Professor, Nephrology*
- **Jeffrey Chi, MD**, *Clinical Assistant Professor, Internal Medicine*
- **Mark Krasnow, PhD**, *Professor, Biochemistry*

The Henry J Kaiser Family Foundation Award for Excellence in Clinical Teaching

- **Jay Jernick MD**, *Clinical Associate Professor, Internal Medicine*
- **Kevin Keet, MD**, *Internal Medicine*
- **Gordon Lee, MD**, *Assistant Professor, Plastic Surgery*

The Arnold P Gold Foundation Award for Humanism and Excellence in Teaching

- **Monica Dua**, *Vascular Surgery*
- **David Iberri**, *Medicine*
- **Michelle Jonelis**, *Neurology*
- **Sid Mahapatra**, *Pediatrics*
- **Mariam Naqvi**, *Obstetrics and Gynecology*
- **Anand Veeravagu**, *Neurosurgery*

Lawrence H Mathers Award for Exceptional Commitment to Teaching and Active Involvement in Medical Student Education

- **John Gosling, MD**, *Professor, Surgery - Anatomy*

School of Medicine Award for Graduate Teaching

- **Nigam Shah, PhD**, *Biomedical Informatics*

School of Medicine Award for Outstanding Service to Graduate Students

- **Daniel Herschlag, PhD**, *Professor, Biochemistry*

Best Lecture or Presentation 2012

- **Lisa Chamberlain, MD**, *Assistant Professor, Pediatrics*

Outstanding Teaching Assistant

- **Daniel Roberts**, *SMS III*

Community Preceptor (Clinical) 2012

- **Erick Miranda, MD**, *Clinical Instructor, Emergency Medicine*
- **Scott Klein**, *Internal Medicine*

Other Awards and Honors

- **Dr. Steve Quake**, Lee Otterson Professor in the School of Engineering and Professor of Applied Physics and, by courtesy, of Physics, has been awarded the 2012 Lemelson-MIT Prize in recognition of his inventions. Quake invented a chip, similar to those in electronic devices, that lets scientists take nearly 10,000 different measurements at once. Through his work, called microfluidic large-scale integration, companies and research organizations are able to use the rubber chip technology in developing cancer drugs. The Lemelson-MIT Prize is known as the “Oscar for inventors” and recognizes people who translate ideas into innovations that improve the world.
- **Dr. Fernando Mendoza**, Professor of Pediatrics at Lucile Salter Packard Children’s Hospital, has received the President’s Award for Excellence through Diversity.
- **Dr. Ware Kushner**, Associate Professor of Medicine (Pulmonary and Critical Care Medicine), has been named as the recipient of this year’s William A. Nelson Award for Excellence in Health Care Ethics. This award was established to recognize a Veterans Health Administration employee and is based on the nominee’s contributions that demonstrate long-term commitment and achievement in the area of ethics education, consultation, policy, scholarship, or leadership.
- **Dr. Robert Tibshirani**, Professor of Health Research and Policy (Biostatistics), has won the 2012 Gold Medal of the Statistical Society of Canada (SSC). This award is the highest distinction bestowed by the SSC. It is given annually to a Canadian statistician or probabilist who has made outstanding research contributions to statistical sciences and is intended to honor a leader in the field.
- **Information Resources and Technology (IRT)** has been awarded the 2012 AMX Innovation Award for Automation & Control. It was selected from over 500 applications from universities across the globe.

Congratulations to all!

Appointments and Promotions

Alexander Butwick has been appointed to Assistant Professor of Anesthesia, effective 5/01/2012.

Andrew D. Endy has been reappointed to Assistant Professor of Bioengineering, effective 6/01/2012.

Nayer H. Khazeni has been appointed to Assistant Professor of Medicine, effective 6/01/2012.

Michaela Liedtke has been reappointed to Assistant Professor of Medicine, effective 9/01/2012.

Mark Pegram has been appointed to Professor of Medicine, effective 5/01/2012.

Eila Skinner has been appointed to Professor of Urology, effective 5/01/2012.

Edda Spiekerkoetter has been appointed to Assistant Professor of Medicine, effective 6/01/2012.

The Dean's Newsletter: July 2, 2012

The State of Health in the US: Not Even the End of the Beginning

The much-anticipated decision of the US Supreme Court on June 28, 2012 reawakened the national debate on healthcare in the US with much of the rhetoric that preceded the signing into law of the Patient Protection and Affordable Care Act (ACA) by President Barack Obama on March 30, 2010. Chief Justice Roberts wrote the 5-4 decision that upheld the constitutionality of the ACA and specifically its mandate that all US citizens must have health insurance (even now nuanced through a tax or supported by the federal government if they fall below 133% of federal poverty). The "mandate" for healthcare coverage had been challenged in a series of lawsuits under the banner of the *"National Federation of Independent Business et al v. Sebelius, Secretary of Health and Human Services, et al."* In a 59-page opinion that was joined by Justices Ginsburg, Breyer, Sotomayor and Kagan, Chief Justice Roberts concluded that an individual mandate for health insurance "is within Congress's power to tax." This provided an alternate way to uphold the constitutionality of the ACA, rather than the more widely and publicly debated proposal that it could be supported through the Commerce Clause that authorizes Congress to regulate interstate commerce. While Chief Justice Roberts decided against the use of the Commerce Clause, the decision that the mandate could be enforced through the taxing power of Congress proved critical to the majority decision upholding the constitutionality of the ACA.

Justices Scalia, Kennedy, Thomas and Alito filed a separate minority and dissenting opinion that the ACA "exceeds federal power" and "that the entire statute is inoperative."

While the individual mandate was upheld by Chief Justice Roberts' majority opinion, the Court ruled that while Congress can offer states the choice to accept an expansion of Medicaid as delineated under the ACA, they cannot do so in a fashion that the Court deemed coercive by requiring states to adopt the expansion or risk losing existing Medicaid funding. The expansion of Medicaid is thus left to the states to decide whether to pursue - a decision that has a number of implications, given the economic challenges a number of states currently face, and which have been made even worse by the economic downturn that began in 2008.

Needless to say, the issue of healthcare reform has been front and center in the press and in politics over the past several years and especially the last week. And while the ACA is a major step toward developing a more organized health and healthcare system for the US, it is an imperfect and complicated legislation that addresses only some of the important challenges we face as a nation, where healthcare costs continue to rise and now represent nearly 18% of the GDP. These excessive costs (twice that of other developed nations) do not come with clear metrics supporting the success of our "fee-for-service" employer-based health insurance care. Nor are the issues and debates around organizing healthcare for the US new, although most efforts to reform or organize healthcare have resulted in frustration and failure - which is what makes the recent Supreme Court decision so important. Several Stanford faculty members have offered their perspectives on the Supreme Court decisions (see: <http://scopeblog.stanford.edu/2012/06/28/stanford-experts-respond-to-supreme-courts-decision-on-health-law/>).

Indeed most of the 20th century was rife with debates about healthcare in the US, beginning with Teddy Roosevelt's endorsement of social and health insurance during his failed attempt to regain the presidency in 1912 as the candidate from the Progressive Party. Over the ensuing decades and through nearly every presidency, from FDR through Barack Obama, decisions about whether to introduce healthcare reform were intently avoided (notably by FDR) or more comprehensively pursued (e.g., Truman, Johnson, Clinton, Obama) but virtually always with divisive forces defining the boundaries of the debate in what has become market driven healthcare rather than a more thoughtfully organized healthcare system. Even today, when the unemployment rate still exceeds 8%, many point to healthcare as one of the important drivers of the local and national economy. Certainly healthcare has become a major employer in a number of cities and states, providing jobs and opportunities for millions of citizens. However, the notion that the market will correct the rising costs of medical care has certainly not been demonstrated to date, not the least reason being that health and healthcare are not commodities in the usual sense of the word - and, in the case of the US are impacted by divergent interests and perverse incentives. As discussed in a recent Perspective article in the June 28th *New England Journal of Medicine* entitled "*The Health Care Jobs Fallacy*" (see: <http://www.nejm.org/doi/full/10.1056/NEJMp1204891>), Katherine Baicker and Amitabh Chandra argue that "*The bottom line is that employment in the health care sector should be neither a policy goal or metric of success. The key policy goals should be to achieve better health outcomes and increase overall economic productivity, so that we can all live healthier and wealthier lives.*"

The journey to healthcare reform has been detailed and documented in countless scholarly articles, policies statements, the lay and professional press and public debates.

An interesting chronicle of the efforts to address healthcare by various Presidents, from FDR to Obama, is described in ***The Heart of Power: Health and Politics in the Oval Office*** by David Blumenthal and James Morone (2010. University of California Press). While there is no denying that the ACA is landmark legislation, it really only addresses certain aspects of health and healthcare and to varying extents is more of a reform of healthcare insurance than healthcare in its broader domains. As such it is really a beginning - but an important one nonetheless. While there are certainly many different views, had the ACA been declared unconstitutional or the mandate not allowed as a tax, much of what has been achieved since 2010 in insurance reform would likely unravel, in part or in whole. And much of what is still to come would have been stalled or thwarted, especially in today's highly polarized political environment. Since signing the ACA by President Obama in 2010, 57 different provisions of the ACA have been brought forth, of which some 52 are in effect. These provisions are wide ranging and some are already popular to Americans; however, most are unknown, a number of which are important. Moreover, a number of important aspects and provisions of the ACA are slated for 2013-2018, several of which will play a key role in the ultimate shift from a more individualized "fee-for-service" payment system to one that is based on the health of communities and populations. These changes also take place among the most exciting eras in our understanding of human biology and the risk for disease (and health) that is both individual and population based. Brief descriptions of some of the provisions yet to be introduced are listed below.

In 2013:

- State Notification Regarding the American Health Benefit Exchange
- Closing the Medicare Part D coverage gap (sometimes referred to as the "doughnut hole")
- Establish pilot programs to develop and evaluate "bundled payments" through Medicare
- Increase matching payments for preventive services in Medicaid
- Increase Medicaid payments for primary care physicians
- Increase the threshold for itemized deductions for unreimbursed medical expenses (except for a waiver for individuals 65 years or older through 2016)
- Limit the contributions to flexible spending accounts for medical expenses to \$2500 per year
- Increase in Part A Medicare taxes on a wage basis
- Eliminate tax-deduction for employers who receive the Medicare Part D retiree subsidy payments
- An excise tax of 2.3% on the salable of taxable medical devices
- Disclosure of financial relationships between health entities - which includes physicians, pharma, etc. (previously known as the Physician Sunshine Act)
- Creation of "Consumer Operated and Oriented Plans" to foster the creation of non-profit member run health insurance companies
- Extension of the Children's Health Insurance Program (CHIP) through 2015

In 2014

- Expansion of Medicaid to individuals not eligible for Medicare with incomes up to 133% of the federal poverty level. *This was one of the provisions that was impacted by the Supreme Court decision as noted above*
- Provision that hospitals participating in Medicaid can make presumptive eligibility determinations for Medicaid-eligible populations
- The "mandate" for US citizens and legal residents to have qualifying health coverage begins to go into effect. *This was one of the central issues of the Supreme Court decision - and as noted above, it is now approved as a "tax"*
- State-based exchanges - the "American Health Benefit Exchanges and Small Business Health Options Program Exchanges" become operative for small businesses with up to 100 employees
- Health insurance premium subsidies will be available to families with incomes between 133-400% of the federal poverty level so they can purchase insurance through the Exchanges
- Guaranteed and renewable health insurance will be available regardless of health status - the ratio of which may vary by certain factors such as age, geographic area, family composition, tobacco use
- Limits on the dollar value of insurance coverage will become prohibited.
- Essential health benefits that provide a comprehensive set of services will be created and include categories of plans that can be offered
- The Office of Personnel Management will be required to contract with insurers to offer at least two multistate plans in state "Exchanges", one of which must be by a non-profit entity and at least one of which must not provide coverage for abortions beyond those permitted by federal law
- A temporary reinsurance program will be created to collect payments from health insurers to provide payments of plans in the individual market that cover high-risk individuals
- States are permitted the option to create a Basic Health Plan for uninsured individuals with incomes between 133-200% of the federal poverty level who would otherwise be eligible to receive premium subsidies in the Exchange
- An assessment of \$2000 per full-time employees (excluding the first 30), on employers with more than 50 employees that do not offer health insurance coverage and have at least one employee who receives a premium tax credit
- Medicare Advantage plans will be required to have "medical loss ratios" no lower than 85% (which means that more dollars will go to direct health than to administrative costs)
- Financial incentives will be given to employers offering wellness programs and meeting "health-related standards"
- New fees will be levied on the health insurance sector
- An Independent Payment Advisory will be established to submit legislative proposals containing recommendations to reduce the per capita growth in Medicare spending if spending exceeds a target growth rate
- Medicare payments to Disproportionate Share Hospitals (DSH) will be reduced initially by 75% and subsequently increased on the percent of uninsured and uncompensated care provided

- Medicaid Disproportionate Share Hospital Allotments will be reduced but the methodology is to be established by the Secretary of HHS
- Medicare payments to hospitals will be reduced for "hospital-acquired conditions" by 1%

In 2015

- There will be a 23% increase in the Children's Health Insurance Program (CHIP) match rate up to a cap of 100%

In 2016

- States are permitted to form "health care choice compacts" and insurers can sell policies in any state permitted in the compact.

In 2018

- An excise tax on insurers of employee-sponsored health insurance plans with aggregate expenses that exceed \$10,200 for individuals and \$27,500 for family coverage

Clearly the 35 additional provisions that are expected to unfold between 2013-2018 are somewhat of a hodgepodge of actions that are mainly focused on health insurance reforms and payments from federal and state entitlement programs (Medicare and Medicaid). While the ACA will provide care to a majority of the US citizens and legal residents who are currently uninsured and while it attempts to reduce some of the payments and the basis for the payments (quality and safety in addition to service performed) in Medicare and Medicaid, this does not, in itself, constitute or provide a new comprehensive healthcare system. Nor does it necessarily control healthcare costs. A short and highly readable summary of this challenge is covered well in Victor Fuch's Perspective article in the March 25, 2012 issue of the *New England Journal of Medicine* entitled "*Major Trends in the U.S. Health Economy since 1950*" (see: <http://www.nejm.org/search?q=victor+fuchs>). About this there is much work to be done and it will require bold and creative new approaches to the delivery of health and healthcare and a focused attention on quality, efficiency, service - and cost. Thankfully Stanford University Medical Center is deeply committed to achieving these goals and has embarked on a number of initiatives that are unfolding now and that will continuously evolve over the years ahead.

I shared above the scope of the ACA provisions yet to come since some will shape the political and healthcare debate that will unfold in the months and years ahead. I doubt that many of them will be clearly delineated in the general public coverage of the health care debate - or that those engaged in the debate fully appreciate their scope and potential impact. Clearly there will be proponents and detractors in a debate that has been unfolding for decades - and that will likely continue for decades to come. While it is easy to frame the debate around government control or escalating costs or "medical loss" and insurance or Medicare fraud and abuse, it is the human condition that underlies this issue

- and it rests very much on whether we consider health care a commodity or a human right, an individual responsibility or a province for government oversight and regulation. Moreover health and healthcare cannot be divorced or separated from other societal issues and challenges. These are well framed in an article entitled "*To Isaiah*" that appeared in the June 27th issue of JAMA

(see: <http://jama.jamanetwork.com/article.aspx?articleid=1199158>) that Dr. Mike Link, Professor of Pediatrics, called to my attention. Dr. Don Berwick, a longtime colleague of mine, and the recent Administrator of the Centers wrote this thoughtful essay on medicine and society for Medicare and Medicaid Services (CMS). It is very much worth reading and offers much reflection as the healthcare debate continues to unfold.

As I noted at the outset of this Newsletter, the recent Supreme Court decision is just another chapter in the end of the beginning of the healthcare reform in the US. Much remains to be done before the US has a comprehensive healthcare system we can all be proud of. Hopefully Stanford Medicine will play an important role in achieving that goal.

Team Science Workshop Series

As scientific discoveries and translations become increasingly interdisciplinary and collaborative, there is an increasing need to prepare and train scientists for effective teamwork. Since its inception in 2008 as part of the Stanford Clinical and Translational Award (CTSA), the Career Development and Diversity Center (CDD), led by Dr. Hannah Valentine, Senior Associate Dean for Diversity and Leadership, has been developing programs for education in Team Science, an emerging field focused on understanding and managing facilitators and inhibitors to interdisciplinary collaborative science.

This year, based on feedback from prior programs, the CDD created the Team Science Workshop Series, the first educational initiative with a defined curriculum on principles and strategies for team effectiveness. The series, which ran from January to May 2012, consisted of five 2.5- to 3-hour workshops led by leading scholars and practitioners in Team Science. The workshops covered, in order: 1) an overview of Team Science in the clinical and translational research landscape (Dr. Holly Falk-Krzesinski, Northwestern University Clinical and Translational Science Institute); 2) discussions on building trust, vision and expectations in scientific collaborations (Drs. Michelle Bennett and Howard Gadlin, NIH); 3) case studies of interdisciplinary clinical and translational research teams (Drs. Maritza Salazar, Claremont Graduate University, and Theresa Lant, Pace University Lubin School of Business); 4) practical exercises and discussions around management of conflicts, team norms and team processes (Dr. Barbara Gray, Penn State Smeal College of Business); and 5) interactive exercises for teamwork, trust-building and creative thinking (Dan Klein, Stanford University and Rich Cox, ImprovImpact).

A total of 41 faculty members and 10 research professionals and administrators (including three invited guests from UCSF) participated in the Team Science Workshop Series. Faculty participants were selected based on recommendations of their involvement in and commitment to interdisciplinary collaborative research. Participants represent fourteen departments in the School of Medicine, across ranks and faculty lines, and varied positions and roles in research administration. Their research teams span across clinical and basic science disciplines, often also reaching into engineering and

natural sciences, and many participants hold leadership roles in multiple teams. Over half of the participants attended three or more workshops, and surveys of participants before and after the series suggest gains in feelings of preparedness for leading and building effective team processes.

Feedback from participants has been encouraging and suggestive of interest in further Team Science training programs. Participants noted the importance of gaining new perspectives and learning from one another. The series also provided networking opportunities, as some participants have joined together to begin new research collaborations. The CDD is currently working to develop a second follow-up series to explore the practices and conditions that foster team effectiveness and productivity through more in-depth and experiential education processes.

Congratulations to Dr. Valantine and Candy Ku for a successful program, which is addressing a key training need for advancing translational research. We look forward to continuing Team Science education efforts at Stanford.

Awards and Honors

- **Dr. David Spain**, Professor of Surgery, was named the inaugural holder of the Carol and Ned Spieker Professorship at a celebratory luncheon and ceremony on June 26, 2012. This new professorship was made possible because of the generosity and commitment of Carol and Ned Spieker and also honors Ned's friend of more than six decades, Dr. David Gregg. Dr. Gregg is currently a clinical associate professor in the department of surgery and is widely recognized as an outstanding physician and surgeon who has played a critically important role in trauma surgery at Stanford - and for Mr. Spieker specifically. In addition to honoring Dr. Spain as the first incumbent of this new professorship, the Spieker family has determined that when Dr. Gregg retires, the professorship will be renamed the David L. Gregg, MD Chair in Acute Care Surgery. We are indebted to Carol and Ned Spieker and offer congratulations to Dr. Gregg and to Dr. Spain.
Profile: http://med.stanford.edu/profiles/David_Spain/
- **Dr. Susan Swetter**, Professor of Dermatology and Director of the Pigmented Lesion and Melanoma Program at Stanford University Medical Center and Cancer Institute was honored on May 17th with the Melanoma Research Foundation's *2012 Humanitarian Award* for her commitment to the prevention, treatment and cure of melanoma.
Profile: http://med.stanford.edu/profiles/Susan_Swetter/

Appointments and Promotions

- **Vivien Abad** has been appointed as Adjunct Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 6/01/12.
Profile: http://stanfordhospital.org/profiles/Vivien_Abad
- **Fred Ackroyd** has been appointed as *Adjunct Clinical Professor* of Surgery, effective 9/01/12.

- **Kavin Desai** has been appointed as Adjunct Clinical Assistant Professor of Pediatrics, effective 4/01/12.
Profile: http://stanfordhospital.org/profiles/Kavin_Desai
- **Lorne Eltherington** has been appointed as Adjunct Clinical Associate Professor of Anesthesia, effective 6/01/12.
- **Cia Foreman** has been promoted to Adjunct Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective May 1, 2012.
- **Ricardo Munoz** has been appointed as Adjunct Clinical Professor of Psychiatry and Behavioral Sciences, effective 9/01/12.
- **Rebecca Powers** has been promoted to Adjunct Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 6/01/12.
- **Brian Roberts** has been promoted to Adjunct Clinical Assistant Professor of Medicine, effective 8/01/12.
- **David Seidenwurm** has been appointed Adjunct Clinical Associate Professor of Radiology, effective 8/01/12.
- **Albert Shen** has been promoted to Adjunct Clinical Assistant Professor of Medicine, effective 3/01/12.
- **Michael Smith** has been promoted to Adjunct Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 6/01/12.
Profile: http://stanfordhospital.org/profiles/Michael_Smith

Dean's Newsletter

July 24, 2012

Welcome to Provost Lloyd Minor as the Next Dean of the Stanford University School of Medicine

I am extremely pleased to extend my personal welcome to Dr. Lloyd Minor, who will succeed me as Dean of the School of Medicine on December 1st. Dr. Minor's contributions in science and medicine and currently as Provost of The Johns Hopkins University School of Medicine were well delineated in the announcement of his appointment on Wednesday July 18th (see: <http://med.stanford.edu/ism/2012/july/minor.html>). Over the weeks that I have interacted with Dr. Minor since the Search Committee and Provost completed their deliberations, I have been very impressed by the thoughtful and thorough way he has sought to learn about Stanford as a medical school and university. Dr. Minor's commitment to excellence is evident from his many past accomplishments and important leadership positions, and I am sure that he will work in a visionary and insightful manner with faculty, students, staff and leaders across the Medical Center and University to guide the future of Stanford Medicine to even greater heights and accomplishments.

While I will do so again in my last Dean's Newsletter this November, I also want to thank our entire community for their dedicated commitment to making Stanford Medicine a truly outstanding institution and community of excellence across all its missions. Despite the many challenges facing academic medical centers, the future for

Stanford Medicine is exceptionally bright and is made even more so by the appointment of Dr. Minor as the next dean.

Precision Medicine and the Health of Individuals and Communities: Managing Expectations

Hardly a day goes by when there isn't a report about a promising new discovery, insight, technologic breakthrough, new test or potential treatment from the rapidly advancing world of human genomics - and the modifying impact of epigenomics, proteomics, microbiomics, and metabolomics, now gathered under the banner of "omics." Indeed, it is a very exciting time in science and medicine, but it is also a time when enthusiasm and passion can give way to expectations that exceed current knowledge. This is a story we have witnessed many times, when enthusiasm and oversimplification can be taken for fact and when promissory messages advance beyond current realities.

At Stanford, exciting new technologies and opportunities have unfolded from the work of a number of scientists. One of the most notable is the recently reported "integrative personal genomics profile" described by Dr. Mike Snyder and his colleagues. They collected billions of bits of data serially, thus permitting a unique (and highly individualized) glimpse into how his genes and proteins responded to changing conditions of health and disease. In a seminal paper published in the March 16, 2012 issue of the journal *Cell*

(<http://www.sciencedirect.com/science/article/pii/S0092867412001663>), Snyder and his colleagues reported on the monitoring of some 20,000 distinct transcripts that coded for some 12,000 genes and measured the levels of over 6,000 proteins and over a thousand metabolites. The amount of data generated from this study of a single individual is staggering and illustrates that the rate-limiting step in the future will be how to gather, store, analyze and utilize massive amounts of data. While the technology permits rapid sequencing and unique measurements to be done in humans, it will be the wisdom and subsequent algorithms developed by biostatisticians and informaticians that will permit such data to be useful in day-to-day clinical settings. Clearly these opportunities are exciting, but they are also fraught with hazard – not just because of what is now known, but also more importantly because of what remains to be learned and analyzed.

Generalizing from unique individual experiences minimizes the incredible technologic, analytic and evidence based medical and even ethical issues that must be understood.

The excitement and potential of the opportunity has gone hand in hand with recent promises being made by medical centers around the nation – nearly all of which are forecasting personalized medicine as imminent and transformative. While it is easy to share in the excitement, we also have a responsibility to be cognizant of what we do know and can do now, versus what we think we can do but really don't know if we can accomplish. As in the past there is a competitive rush among academic medical centers and biomedical research institutes to be the "leader" in this endeavor. At Stanford we are fortunate to have among the most talented scientists in the world in this rapidly emerging discipline – from the molecular to the population levels. We also have the advantage of incredible depth in computer science, engineering, informatics and statistics. There is

every reason to aspire to lead this field – as long as we do so with evidence and responsibility. Some of the challenges dealing with the massive deluge of data are the topic of the newly published Summer 2012 issue of Stanford Medicine (see: <http://stanmed.stanford.edu/2012summer/>). I encourage you to read these excellent and timely articles.

Some very difficult lessons have been learned from centers where perceived potential became a marketing tool for cancer treatment – as was evidenced by the serious problems that impacted the Duke Cancer Center in recent years (duke http://www.nytimes.com/2011/07/08/health/research/08genes.html?_r=1). A recent series of articles in the *New York Times* also illustrates some of the extraordinary areas of promise as well as disappointment in cancer genomics (see: <http://www.nytimes.com/2012/07/08/health/in-gene-sequencing-treatment-for-leukemia-glimpses-of-the-future.html?ref=ginakolata> and <http://www.nytimes.com/2012/07/09/health/new-frontiers-of-cancer-treatment-bring-breathtaking-swings.html?ref=ginakolata> and <http://www.nytimes.com/2012/07/10/health/genetic-test-changes-game-in-cancer-prognosis.html?ref=ginakolata>). Of course the cycle of promise and disappointment is hardly new to scientists, physicians – or the patients and public we serve. But they are reminders to approach new knowledge with respect, thoughtfulness and evidence – as well as with enthusiasm.

The need for such balance prompted the Institute of Medicine of the National Academy of Sciences to issue a March 23, 2012 report entitled the “Evolution of Translational Omics: Lessons Learned and the Path Forward” (see: <http://www.iom.edu/Reports/2012/Evolution-of-Translational-Omics.aspx>). In the précis to this report, IOM notes that *“Genomics, proteomics, and other branches of molecular bioscience offer the prospect of greater precision in medical care, but some clinical tests based on “omics” research have proved invalid and highlighted the challenges of dealing with complex data. To enhance the translation of omics-based discoveries to clinical use, a new report by the Institute of Medicine recommends a detailed process to evaluate whether the data and computational steps underlying such tests are sound and the tests are ready to be used in clinical trials. The proposed process defines responsibilities and best practices for the investigators, research institutions, funders, regulators, and journals involved in development and dissemination of clinical omics-based technologies.”* While the cautions and caveats noted by the IOM are important, it is not really feasible for each institution to define best practice in isolation. Rather, this is something that should be part of a national standard setting – although individual institutions, including Stanford, can help pave the way to a national dialogue.

Recognizing that the national dialogue is really in its nascent stages, it seems important to provide some guidance for how we should proceed with the “omics revolution” within the Stanford University Medical Center. Accordingly, the CEOs of Stanford Hospital and Clinics along with the Dean of the School of Medicine and the Vice Provost for Research have recently assembled two committees – one to address “omics” in clinical care at SUMC, and the second to provide guidance and recommendations on the infrastructure

needed to support “omics” at SUMC. Each of the Committees includes representatives from SUMC and the University. They will be led by Dr. Steve Galli, The Mary Hewitt Loveless Professor and Chair of Pathology, and will provide a white paper report to the SUMC and University leadership by December 2012. These two Committees have just begun their work in the past week. Because this is such an important issue for our entire community I am taking the liberty of sharing the charge to each of these committees, recognizing that the scope and depth of their work and deliberations will almost certainly evolve as they get underway this month. Here are the charges:

1. ***To the Guidelines and Policy Committee: make recommendations and develop guidelines regarding the use of genomic and other "omics"-based data (such as those derived from assessments of patients' transcriptomes, proteomes, metabolomes, microbiomes, etc.) for the clinical care of patients at SHC and LPCH. Specific charges include:***

- Make detailed recommendations regarding how to provide such "omics-guided" clinical care in a manner that advances the goals of providing leading edge and coordinated patient care and ensuring that Stanford take a leadership role in such efforts, while also maintaining full compliance with all applicable certification requirements, regulations, and policies that apply to such testing, including HIPAA, CLIA, and Joint Commission/CAP/ASHI.
- Ensure that the recommendations set guidelines for the appropriate use of "omics testing" that: (1) clearly differentiate between the requirements to define the analytical and clinical validity of such testing, and those required to document clinical utility; (2) differentiate between the use of such testing for research vs. clinical care; (3) ensure that SUMC physicians and their patients who agree to have omics testing performed (whether on themselves or on dependents such as minor children) understand when the testing is being done solely or partly for research as opposed to when and how such testing can be used solely or partly for clinical care, including the limitations of testing that does not have documented clinical utility; and (4) develop guidelines for when the availability or use of such testing can be reported in any news releases, advertising, or fund-raising activities of the SOM, SHC or LPCH and how the clear distinction between the research and clinical uses of such testing should be maintained.
- Provide estimates of the costs of various approaches to implementing its recommendations.
- Propose a mechanism to provide scientific and clinical oversight of this ongoing effort.
- Recommend an oversight mechanism that ensures that such testing is developed and performed in full compliance with Stanford's policies regarding individual and institutional conflicts of interest.
- Produce a white paper document to convey these recommendations to the SUMC and University leadership.

2. ***To the Infrastructure Committee: make recommendations regarding the requirements for data storage, security, and use for employing human genomes and other large data sets (such as those derived from other "omics" analyses, or from digital anatomic pathology or radiology) for the care of patients at SHC and LPCH***

- Make recommendations regarding the requirements for: (1) acquiring and managing the amount of data storage capacity (whether within SUMC or elsewhere), (2) security provisions, and (3) IT functionality needed in order to use large data sets such as those derived from genomic and other "omics" studies to care for patients at SHC and LPCH in a manner that is fully compliant with all applicable certification requirements, regulations, and policies that apply to such testing, including HIPAA, CLIA, and Joint Commission/CAP/ASHI. The recommendations should specifically address the issue of whether patients' individual genomes or other large data sets should be embedded in the patients' SHC or LPCH EMRs, or instead should be accessible when needed for clinical care but stored outside of the standard EMR.
- Define the: (1) facilities, (2) personnel (professional and support), and (3) institutional capabilities required for the bioinformatic analysis of the results of such testing, and for linking such data, and such data analysis tools to the electronic medical records of SHC and LPCH.
- Provide estimates of the costs of various approaches to implementing its recommendations.
- Propose a mechanism to provide scientific, IT and clinical oversight of this ongoing effort.
- Recommend an oversight mechanism that ensures that such bioinformatics analysis and other IT functionality is developed and performed in full compliance with Stanford's policies regarding individual and institutional conflicts of interest.
- Contribute to a white paper document to convey these recommendations for the SUMC and University leadership.

There is little question that these deliberations will be a work in progress that will be informed by new insights along with data emerging from Stanford as well as from institutions around the nation and world. Importantly, these Committees will also help inform other major initiatives underway to align precision medicine with population health sciences. The goal of this alignment is to create a bidirectional flow of knowledge on the inherent biological and environmental factors affecting health and disease for individuals as well as for communities. These are exciting opportunities that will change the way we think about human biology and establish new paradigms for how we care for communities.

Personalized Medicine Witnessed Through an Individual Lens

Appropriately, there is a much greater focus on preserving health and wellness now, as part of the evolving health care reform debates and discussions in the US, than in previous eras. Of course, an important component of preserving health is personal responsibility. We all recognize that there are features of health and disease that we can't control as individuals because of genetic or epigenetic risk factors (as discussed above) or because of just bad luck. Often when physicians or the public think of preserving health, diet and exercise quickly become prominent in the discussion. And for good reason! There is no question that obesity is becoming a major health liability in the US and that it is rapidly emerging as a worldwide problem, with short and long-term consequences to individuals and societies. We also recognize how valuable exercise is to physical wellness – from cardiovascular health to helping prevent dementia – and we know as well that lack of exercise impacts obesity and that obesity negatively impacts exercise.

In a number of ways I have not been shy about sharing my personal views on personal health as well as broader topics about healthcare in the US. I have tried to “practice what I preach” about personal health and wellness, and I thought I was making good decisions about exercise and diet. But I missed a simple health maintenance practice that has had a number of negative personal consequences and that has compelled me to consider another facet of wellness through a different lens. Moreover, as I have become more attentive to this practice, I also see it is one overlooked by many of my colleagues as well, probably including a number of you. It came to my personal attention in an ironic way.

In late April of this year I was preparing to leave on the red eye to DC (a regular itinerary for me) that was to include a meeting the next day with the Office of the Secretary of the Department of Health and Human Services about a report that I had chaired for the Institute of Medicine. Having spent nearly eight intense months with a dedicated committee, our report, entitled “*Relieving Pain in America*”, (see also http://deansnewsletter.stanford.edu/archive/07_05_11.html#1) addressed the public health problems associated with chronic pain. More than 100 million American adults experience chronic pain from various causes at a cost of \$560-635 billion dollars per year. That's more than we spend as a nation on cardiovascular disease, cancer and diabetes combined. Despite these expenditures and the incredible toll on individuals and the nation, we lack many of the tools to accurately diagnose, treat and prevent chronic pain. Our report proposed “*A Blueprint for Transforming Prevention, Care, Education, and Research*” (which published in November 2011 by the National Academies Press). What I didn't realize as I helped prepare the report on pain in America and got ready to return to Washington to help continue to foster its implementation was that I would soon be one of the 100 million. It began, as it often does, with a simple act that was soon accompanied by acute back pain that has been followed by a long chronic phase mandating a number of changes and accommodations. I was first surprised but, in retrospect, recognize that I had not taken the personal responsibility to avoid or prevent this injury.

Part of the problem was that until this personal health challenge arose, I thought of myself as in “great shape.” For many (many) years I have run 50-70 miles per week, without any real joint aches or pains, seeming to defy the conventional wisdom that one

gets out of balance. Of course, what I hadn't done (despite many cautions to do so) was to also pay attention to building "core body strength" and preserving a healthy posture. In fact I had done terribly in both areas. Since April, I have now done what tens of millions of Americans have had to do, to greater or lesser extents. I have sought medical advice, had MR scanning, had physical therapy, utilized acupuncture, done lots of exercises and stretches - and engaged in posture training (which has been particularly challenging for a body with decades of sitting and standing in the wrong directions).

So, why I am sharing this personal saga with you? I now recognize that my problems, probably like tens of millions of others, is a result of not paying attention to well known features of personal wellness. Of course I realize that sharing my personal experience as advice is starting to sound paternalistic – although I remember well the admonitions of friends and colleagues about how poor my posture was. But that is not the reason for this commentary. Now that I am actually paying more attention to posture for my own health and wellness, I am also more attentive to how significant an occupational hazard it is in our community. Over the years I have heard from countless surgeons and anesthesiologists about their personal encounters with neck and back pains that not infrequently curtailed or limited their clinical practice and that were the result of their posture and position in the operating room. It is not, however just in the operating room, since most of us are slumped over computers, just as I am now trying **not** to do as I type this Newsletter. Accordingly, I have used my personal experience to also address this topic with a number of our surgical leaders and colleagues, encouraging them to include posture and ergonomic management for new trainees to help them prevent adopting sitting and standing patterns that will ultimately have a consequence on personal well-being. Similar concerns really apply to all of us whether we are caring for patients, working at the bench or sitting in front of computers.

As I have noted above, the expense of treating pain in America is truly astounding. And ascertaining one's personal genomic sequence would influence almost none of the outcomes, including early diagnosis and management. But many billions of dollars that are spent on lost productivity in the workplace, as well as the cost for medical interventions, could be saved if we devoted more attention to posture, ergonomics and core strengthening, in addition to diet and exercise. I see this more clearly through my personal experience – and I also see lots of my colleagues who are in the queue for a similar experience to mine unless simple health and wellness procedures are exercised, literally and figuratively.

The Convergence of Individuals and Institutions: Celebrating 50 Years of Clinical Trials Research on Hodgkin's Disease and 51 Years of Contributions by Dr. Saul Rosenberg

Friday, July 13th featured a "*Celebration of Success in the Treatment of Hodgkin's Disease*" (see also <http://med.stanford.edu/ism/2012/july/hodgkins-0716.html>). Fifty years ago the first clinical trial on Hodgkin's disease was done at Stanford led by the pioneering partnership of Drs. Henry Kaplan and Saul Rosenberg. Five decades later

the world of cancer biology and Hodgkin's disease has changed dramatically and serves as a remarkable beacon for discovery and innovation in science and medicine. Work begun at Stanford in Hodgkin's disease in 1962 created collaborations and debates of global significance. Studies in Hodgkin's disease helped shape the field of radiation oncology (largely because of the invention by Kaplan and Ginzton of the linear accelerator). This work also helped define the use of cancer chemotherapy as well as the role of combination chemotherapy and multi-modal therapy. It shaped the way clinical trials were conducted at single institutions and as multi-institutional trials.

This work gave rise to the concept and use of multidisciplinary teams, tumor conferences and collaboration between specialists in medical and pediatric oncology, radiation oncology, surgical oncology, pathology, and supportive care. The follow-up of Hodgkin disease survivors gave evidence of long-term complications (including second malignancies and organ damage) that, in turn, shaped the direction of subsequent clinical studies. As one looks at the history of Hodgkin's disease one can witness the story of cancer diagnosis, treatment and prevention that shaped the latter part of the 20th century and that is being reconfigured with more specific diagnostic tools and treatments in the 21st century. (Parenthetically, a highly readable book that tells the story of Hodgkin's disease and other important malignancies in the Pulitzer Prize winning 2010 book entitled *The Emperor of All Maladies: A Biography of Cancer*, by Dr. Siddhartha Mukherjee).

The symposium on July 13th also brought together many of the seminal investigators from around the world who contributed to the successful treatment of Hodgkin's disease. Importantly, this event appropriately celebrated the 51 year career of Dr. Saul Rosenberg on the Stanford faculty and his transformative role in defining and finding successful treatments for Hodgkin's disease. It is a unique story of individuals and institutions with pioneering ideas and the dedication to bring them to fruition for the benefit of patients. The institutional star of Stanford and Dr. Saul Rosenberg's own star shine very brightly in this story.

Special thanks to the Stanford Lymphoma group and especially Drs. Richard Hoppe and Ranjana Advani for their incredible efforts in making the event possible – and for their own important roles in contributing to the successful treatment of Hodgkin's disease.

Upcoming Event: Medicine X Conference, September 28-30

Medicine X Conference

September 28-30

Li Ka Shing Center for Learning and Knowledge

Discount available for Stanford community

Medicine X is an exciting new conference that explores how emerging technologies will reshape the practice of health and medicine. The conference takes place Sept. 28-30 at the Li Ka Shing Center for Learning and Knowledge. The conference will feature two days of talks by leaders from around the world, a Self Tracking Symposium, and once-in-a-lifetime chance to participate in a design workshop at design firm IDEO. Discounted tickets (up to 56 percent off) are available for faculty, staff, students, and alumni until

Monday, August 6th. STAP funds may be used for reimbursement of the registration fees with your supervisor's approval. For more information, visit: <http://stan.md/medxstanford>

Awards and Honors

- **Dr. James Brooks** was named the first incumbent of the Keith and Jan Hurlbut Professorship in Urology at a wonderful celebratory dinner on July 11th. Congratulations to Dr. Brooks.
- **Dr. Tracy Rydel**, Clinical Assistant Professor of Medicine, and **Dr. Sermsak (Sam) Lolak**, Clinical Assistant Professor of Psychiatry and Behavioral Sciences, have been selected as Rathmann Family Foundation Educators-4-CARE (E4C) Medical Education Fellows in Patient-Centered Care for 2012-2013. This program provides the part-time salary support for a Stanford faculty, fellow, or chief resident to pursue further study and activities focused on the promotion of patient-centered care in medical education. The Educators-4-CARE program, launched in 2008, formally recognizes the critical importance of mentors and clinical teachers by providing tangible support to a cadre of skilled and dedicated teachers of the practice of medicine. Please join us in congratulating Drs. Rydel and Lolak for this important achievement.
- **Dr. Joseph P. Garner**, Associate Professor of Comparative Medicine, has just been named the recipient of AALAS' 2012 Bhatt Young Investigator Award. This prestigious award is given to an outstanding young scientist who has made significant contributions to the fields of laboratory animal science or comparative medicine. Joe's research on animal behavior and animal models of human psychiatric disorders have truly advanced these fields.
- **Dr. John Pringle**, Professor of Genetics, has been selected to receive the Lifetime Achievement Award from the Genetics Society of America. This major recognition is given for lifetime contributions in the field of yeast genetics and outstanding community service. The award will be presented to Dr. Pringle at the Yeast Genetics and Molecular Biology Meeting on August 3rd at Princeton University.
- **The Arnold Gold Foundations Award for Humanism and Professionalism in Medicine** was awarded to 16 medical students based on recommendations of their peers and colleagues at a celebratory event on Friday July 20th. The honorees include:
 - Yi An, SMS 5
 - Joseph Carpenter, SMS 4
 - Andrew Chang, SMS 5
 - Stesha Doku, SMS 5
 - Harry Flaster, SMS 5
 - Deepa Galaiya, SMS 5
 - Jeremy Harris, SMS 4
 - Walter Igawa-Silva, SMS 6
 - Ahlia Kattan, SMS 4

- Ashley Koegel, SMS 5
- Anna Krawisz, SMS 5
- Temitope Lanre-Amos, SMS 4
- Julia Pederson, SMS 4
- Stephanie Smith, SMS 4
- Amy Waterlain, SMS 4
- Joslyn Woodward, SMS 5

Please join me in congratulating this year's recipients of the Arnold Gold Foundation Award for Humanism and Professionalism in Medicine.

Appointments and Promotions

Daniel T. Chang has been promoted as Associate Professor of Radiation Oncology, effective 6/01/12.

Hayley Gans has been reappointed as Assistant Professor of Pediatrics, effective 8/01/13.

Robert Harrington has been appointed as Professor of Medicine, effective 7/01/12.

Stephen Luby has been appointed as Professor of Medicine, Senior Fellow at the Freeman Spogli Institute for International Studies and Senior Fellow at the Woods Institute for the Environment, effective 9/01/12.

Josef Parvizi has been promoted as Associate Professor of Neurology and Neurological Sciences, effective 6/01/12.

Lee Sanders has been appointed as Associate Professor of Pediatrics, effective 6/01/12.

Stephen L. Skirboll has been promoted as Associate Professor of Neurosurgery, effective 6/01/12.

Justin L. Sonnenburg has been reappointed as Assistant Professor of Microbiology and Immunology, effective 6/01/12.

Dean's Newsletter

August 27, 2012

The MD Class of 2012 Arrives at Stanford

We welcomed the incoming MD class of 2012 on Wednesday, August 22nd for their official "transition" to the Stanford University School of Medicine. This year's entering class is our largest. For many years we have admitted 86 students to the MD (and combined MD/PhD) program. We had planned to increase the medical student class size

to 90 students for the class entering in 2012, but we actually will be matriculating 92 students – a record size for Stanford, albeit happily so. These 92 students were selected from an applicant pool of 6810 and are a remarkably talented group. More than half are women and 13 come from communities underrepresented in medicine. Twenty-five were born outside the US; their countries of origin include Australia, Canada, China (including Hong Kong), Ghana, Germany, India, Indonesia, Pakistan, the Philippines, the Russian Federation, Saudi Arabia, Taiwan and the United Kingdom.

Although 70 of the incoming students come from a relatively small number of colleges and universities (17), with the largest contingent (also 17) coming from Stanford), 39 different undergraduate programs are represented. In addition, 14 students have also completed either a Masters or a Doctorate in addition to their undergraduate degree. Nine students join Stanford's MSTP (Medical Science Training [MD/PhD] Program) and at least an equal number will elect to pursue a PhD degree in addition to an MD over the next year or two. Many others will elect to pursue joint degrees with one of the six Stanford Schools where we have joint programs or with UC Berkeley for an MD/MPH degree.

Our incoming students join Stanford with many other accomplishments, talents and interests beyond undergraduate and graduate degrees. Some 30 percent of the incoming students already have peer-reviewed publications, nine have been varsity athletes and twenty have spent at least three months working outside the US.

The vast majority of the incoming students joined with some 25 rising second year students led by Lindsay Sceats and Megan Roosen-Runge for a three-day "SWEAT" (Stanford Wilderness Experience Activity Orientation Trip) Camping Trip from August 18-21 just prior to attending orientation to medical school. This has proven to be a great entry to Stanford – fostering new friendships and shared experiences. The orientation culminated with the "Stethoscope Dinner" on Friday evening, August 24th, which is co-sponsored by the Stanford University Medical Center Alumni Association (SUMCAA). This annual event represents a wonderful opportunity to celebrate the entry of our new students, along with their families, into our Stanford community and family. Dr. Charles Prober, Senior Associate Dean for Medical Education, served as a wonderful "master of ceremonies." Dr. Linda Clever, Associate Dean for Alumni Affairs, in her welcoming comments, made the analogy between the new community of students and families and redwood trees, which exist in groves, share common roots and help support each other – each is stronger as a member of a community than standing alone. The importance of being part of the new Stanford family and community was echoed elegantly in the welcoming comments of Roxana Daneshjou, President of the Stanford Medical Student Association and SMS 4.

In my welcoming comments at the Stethoscope Dinner I highlighted three points. First was the relevance and symbolic importance of the stethoscope and why we celebrate it at the beginning of medical school. As you likely know, Rene Laennec, a French physician, invented the stethoscope in 1816 to improve the diagnosis of chest conditions. While it is distinctly unusual for any invention or innovation to last for as long as the stethoscope

(and indeed there are a number of more precise tools available to clinicians today), this device still has practical and symbolic importance in medicine and, I think, at Stanford specifically. Discovery and innovation are the underpinnings of our missions and efforts at Stanford, and the stethoscope is evidence of the transformative potential of invention. Equally importantly, the stethoscope connects the physician to the patient, compels touch as a symbol of humanism, and also underscores the importance of listening – to the sounds of illness and their verbal and nonverbal expressions in those we serve. Connecting innovation and discovery with humanism and professionalism is at the heart of Stanford Medicine, and the Stethoscope celebration – including giving a new stethoscope to each of our students as part of the entrance to medical school – helps underscore our core values and our aspirations for our future students.

My second point was the importance of focusing on health and wellbeing and not simply on disease as we strive to renew and reshape our medical care systems in the US. This is essential to controlling the spiraling costs of the medical care we provide and, indeed, to the future of our nation. I also emphasized the importance of each student and future physician fostering and promoting her or his own health and wellbeing. A career in medicine is a lifelong journey – in fact, it is a linked series of marathons (really ultra-marathons) – and being as fit and able oneself serves as both a model for health and a means to ensure and enhance one's ability to deliver care.

Finally, I emphasized the importance of Stanford students learning and taking positions of leadership in whatever career path they choose or community they join. The enormous challenges we face today – and will surely need to address in the future – requires leaders, advocates and champions who help create and discover knowledge, improve lives and care for individuals and communities. We have been part of a rich legacy of leaders coming from Stanford Medicine in the past and have every reason to hope that our new students will become the leaders of tomorrow.

I am pleased to share the names of our incoming 2012 class of Stanford medical students:

Muthuraman Alagappan
Stanford – BS, Biochemical Engineering

Whitman College – BA, Biochemistry & Molecular Biology

Noel Fahed Ayoub
UC Los Angeles – BS, Integrative Biology and Physiology

Sebastian Caliri
Yale – BS/MS, Molecular Biophysics & Biochemistry

Margaux Black
Harvard – BA, Psychology

Harvind Chahal
UC Berkeley – BA, MCB-Biological Chemistry

Elena Brandford
Pomona College – BA, Public Policy Analysis - Chemistry

Julia Chandler
Harvard/Pace – BA/MS, Economics/Adolescent Education

Carson Burns

Arhana Chattopadhyay

Harvard – BA, Chemical and Physical
Biology

Mei-Hsi Chen

U of Toronto – BS, Laboratory Medicine
and Pathobiology

Brian Cheung

U of Michigan – BS/MS/PhD,
Aerospace Engineering/Mechanical
Engineering

Bina Choi

MIT – BS, Chemistry

Raymond Deng

Washington St. Louis/Harvard –
BA/MPH, Biology, English
Literature/Health Policy

Anjali Dixit

Stanford/Columbia – BS/MPH,
Biological Sciences/Public Health

Christopher Dove

Truman State – BA, Biology,
Philosophy and Religion

Benjamin Dulken

U of Washington – BS, Bioengineering

Anne Erickson

Stanford – BA, Human Biology

Rogelio Esparza

Princeton – BA, Molecular Biology

Natalia Festa

Harvard – BA, Sociology

Alexander Fogel

CalTech – BS, Business Economics and
Management

Michael Fu

U of Pennsylvania – BS, Bioengineering

Trit Garg

UC Berkeley – BA, Public Health

Megan Garland

Boston U – BA, Chemistry,
Neuroscience

Gregory Gaskin

Stanford – BS, Science, Technology and
Society

Benson George

MIT – BS, Biology

Yannick Goeb

UC Los Angeles – BS, Physiological
Science

Angela Guerrero

CSU Los Angeles – BS, Biochemistry,
Chemistry

Lichy Han

Johns Hopkins – BS, Applied
Mathematics and Statistics, Biomedical
Engineering

Harrison Hines

Duke – BA, Chemistry, Religion

Karen Hong

Johns Hopkins – BA, Public Health

Brian Hsueh

Printeton- BA, Computer Science,
Engineering Biology, Neuroscience

Grace Hunter

Stanford/London School of Hygiene –
BA/MS, Human Biology/Public Health

Michael Hurley

MIT/Stanford – BS/MS – Materials
Science and Engineering/Epidemiology

Diana Huynh

Stanford – BS, Biology

Nadir Ijaz

Duke – BS, Chemistry

Zarah Iqbal

Columbia – BA, Neuroscience and Behavior

Joshua Jaramillo

Brigham Young U – BA, Latin American Studies

Rashmi Jasrasaria

Harvard – BA, Social Studies

Julia Jezmir

Boston U – BA, Biochemistry & Molecular Biology

Maxwell Kligerman

Duke – BA, Political Science

Anisha Kumar

Harvard – BA, Anthropology

Ami Kumordzie

Johns Hopkins – BS, Biomedical Engineering

Grace Laidlaw

Stanford – BS, Biology

Joyce Lee

UC Berkeley – BA, Molecular Biology

Alexander Li

Yale – BS/MS, Molecular Biophysics & Biochemistry

Matthew Li

U of Alberta – BS, Biological & Physical Sciences

Grant Lin

Indiana U – BS, Biochemistry, Neuroscience

Emily Lines

U of Chicago – BA, Biological Sciences

Brian Liu

Johns Hopkins – BS, Biomedical Engineering

Lydia Maurer

Yale – BA, Political Science

Amar Mirza

University of Georgia – BS, Biochemistry & Molecular Biology

Leslie Modlin

Duke – BA, Program II: Biopsychosocial Health

Nuriel Moghavem

Columbia – BA, Neuroscience and Behavior

Tara Mokhtari

MIT – BS, Chemistry

Margaret Mumbi Mongare

Smith College – BA, Biochemistry

Alexander Morgan

Brandeis/Stanford – BA/MS/PhD, Physics, Biomedical Informatics

Michael Nedelman

Yale – BA, Film Studies

Thuy Nguyen

Stanford – BS, Biology

Michelle-Linh Nguyen

Tufts – BA, Anthropology

Colin O'Brien

Brown – BS, Human Biology

Janet Okogbaa

Stanford – BA, Human Biology

Albert Pedroza

Arizona State – BS, Biochemistry

Marcelina Perez

Stanford – BS, Biology

Noelle Pineda

Stanford – BA, Human Biology

Lauren Pischel

Brown – BS, Biology

Elizabeth Qin

Washington U St. Louis – BA, Biology

Meera Ragavan

U of Pennsylvania – BS, Business,
Biology

Suchita Rastogi

Washington U St. Louis – BA,
Biochemistry

Himabindu Reddy

Washington U St. Louis/Columbia –
BA/MPH, Anthropology,
Biology/Sociomedical Science

Caitlin Roake

Stanford – BS, Biology

Thomas Roberts

U of Virginia – BA, Interdisciplinary
Studies

Scott Rodriguez

St. Mary's College/UCLA – BS/MS,
Chemistry

Daniel Rogan

U of Arizona – BS, Molecular and Cell
Biology

Janelle Ruiz

Loyola Marymount U – BA/BS,
Biology/Psychology

Shyam Sathyamoorthi

Tulane – BS, Cell and Molecular
Biology

Zahra Sayyid

Stanford – BS, Biology

Afaaf Shakir

NYU – BS, Neuroscience

Timothy Singer

Carleton College – BA, History

Bernard Siu

U of Pittsburgh – BS, Bioengineering

Holly Stewart

Tufts – BS, Biology, Community Health

Sarah Stewart

Stanford- BS, Materials Science and
Engineering

Priscilla Sugianto

UC Los Angeles – BS, Biochemistry

Kenneth Tran

U of Virginia – BS, Biomedical
Engineering

Madina Tugizova

Stanford – BS/MA, Biology/Russian,
East European/Eurasian

Jessica Vernon

Stanford – BA, Economics, Political
Science

Ellen Wang

U of Pennsylvania – BA, Biology

Caitlin Winget

U of Michigan – BS/MS, Biomedical
Engineering

Diane Wu

UC Berkeley – BS,
Microbiology/Bacteriology

Swati Yanamadala

Yale – BA, Biology

Cissy Yang

Stanford – BS, Biology

Michael Zhang

Harvard – BA, Economics

Alex (Gefei) Zhu

Yale – BS, Chemistry

The Challenging Issue of Student Mistreatment

A commentary on student mistreatment directly following a welcoming of Stanford's 2012 incoming class of medical students is an ironic juxtaposition. All of us at institutions like Stanford – or any medical school – would like to believe that we always treat our students and trainees with respect and professionalism. Sadly, this does not seem to be the case. I raised this issue in the February 21st Dean's Newsletter in a commentary entitled "*A Respectful Learning Environment for Our Students*" (see: http://deansnewsletter.stanford.edu/archive/02_20_12.html#3), which included our published "Standards of Conduct for the Teacher-Learner Relationship at the Stanford School of Medicine." I revisited this topic in an April 23rd article "*More Thoughts About Our Learning Environment*" (see: http://deansnewsletter.stanford.edu/archive/04_23_12.html#3). Since then we have had a number of discussions and reviews with leaders, students and trainees about the disturbing realities that a number of our students perceive and experience, especially humiliation and particularly in clinical settings. These negative student experiences can come from interactions with clinical faculty but also from residents, other healthcare professionals (most notably nurses) as well as from patients and other students. And they are not unique to Stanford. I have been engaged in a national dialogue about student mistreatment with members of the AAMC Council of Deans, since virtually every medical school is witnessing reports by students of mistreatment, mostly in the form of humiliation, in clinical learning environments.

This issue has been recently addressed in two important articles in the July issue of *Academic Medicine* that further highlight the extent and depth of these issues along with recommendations for the tremendous cultural transformations needed to address and deal with them. I call both of these articles to your attention and encourage you to review them. They are: *A Culture of Respect, Part 1: The nature and Causes of Disrespectful Behavior by Physicians* (see: http://journals.lww.com/academicmedicine/Fulltext/2012/07000/Perspective_A_Culture_of_Respect,_Part_1_The.10.aspx) and *A Culture of Respect, Part 2: Creating a Culture of Respect* (see: http://journals.lww.com/academicmedicine/Fulltext/2012/07000/Perspective_A_Culture_of_Respect,_Part_2_11.aspx). Of interest, the lead author on these two publications is Dr. Lucien Leape, who played a seminal role in highlighting the prevalence of medical errors in clinical settings and the call for a culture of safety in the 1999 Institute of Medicine Report "To Err is Human: Building a Safer Health System" (see: <http://www.iom.edu/~media/Files/Report%20Files/1999/To-Err-is-Human/To%20Err%20is%20Human%201999%20%20report%20brief.pdf>).

While student mistreatment and patient safety share some similarities in their ingrained social dynamics (among other behavioral factors), such as the fact that they have become very much a part of the fabric of medicine (including, ironically, medical education), there are also differences. Expectations between teachers and learners have surely evolved over the years, and behaviors that were once tolerated and even accepted as

normative are now seen (even in retrospect) as unacceptable. Any review of the kinds of disruptive behaviors that occur throughout our medical system (including in education settings) would be seen as shocking to virtually any reasonable individual. Here is a list of examples of disruptive behavior that was included in the Leape article referenced above:

Examples of Disruptive Behavior

Inappropriate words

- Profane, disrespectful, insulting, demeaning, or abusive language
- Shaming others for negative outcomes
- Demeaning comments or intimidation
- Inappropriate arguments with patients, family members, staff, or other care providers
- Rudeness
- Boundary violations with patients, family members, staff, or other care providers
- Gratuitous negative comments about another physician's care
- Passing severe judgment or censuring colleagues or staff in front of patients, visitors, or other staff
- Outbursts of anger
- Behavior that others would describe as bullying
- Insensitive comments about the patient's medical condition, appearance, situation
- Jokes or non-clinical comments about race, ethnicity, religion, sexual orientation, age, physical appearance, or socioeconomic or educational status

Inappropriate actions/inaction

- Throwing or breaking things
- Refusal to comply with known and generally accepted practice standards such that the refusal inhibits staff or other care providers from delivering quality care
- Use or threat of unwarranted physical force with patients, family members, staff, or other care providers
- Repeated failure to respond to calls or requests for information or persistent lateness in responding to calls for assistance when on-call or expected to be available
- Repeated and unjustified complaints about a colleague
- Not working collaboratively or cooperatively with others
- Creating rigid or inflexible barriers to requests for assistance/cooperation

I do not doubt that virtually every person in our community would find these kinds of behaviors unacceptable. Unfortunately they occur – across the nation and also at Stanford. I share this list and the articles cited above with you to call attention to this important issue and to the fact that we need to address it. As noted, a challenge is that this is very much of a systemic issue – expressed by physicians, trainees, nurses, patients and students. Addressing these challenges will need to be done in a multifaceted way and will require reflection and response by our community that will focus both on the way we

might behave as individuals and on our tolerance for the behavior of others. We anticipate a number of discussions over the next months with leaders of our clinical departments, residency program directors and medical center leaders that will help us achieve our goals of a respectful learning environment. This is essential.

Promoting Health and Well Being in Healthcare Professionals

I commend the group of medical student leaders who have made the decision to join forces with *Doctors for America* to promote health and well being among physicians and professionals. This is part of national initiative known as DocsRun that will have its first “big event” being a group wide participation in the upcoming Palo Alto Moonlight Run on Friday evening, September 28th. The team includes medical students Rich Joseph, Hayley Wheeler, Nicole Arkin, Megan Roosen-Runge, Adam Daoud, Michael Yokell, Patrick Sullivan and Katie Ransohoff. In addition to promoting health they are also hoping to raise funds for the Stanford Cardinal Free Clinics – both highly meritorious activities. The Palo Alto Weekly Moonlight Run & Walk on September 2 features a 5K walk that begins at 7:00 p.m. as well as a 10K run starting at 8:15 p.m. and a 5K run beginning at 8:45 p.m. For further details you can go to: www.drsforamerica.org/docsrun. The team will also be hosting training sessions, the first of which will be on September 5th at 5pm on the LKSC lawn.

As a longtime and very dedicated runner I really support this program. While it is true that I have been a bit sidelined over the past couple of months (see: <http://deansnewsletter.stanford.edu/#3>) I can still say without any equivocation that significant physical activity and exercise is an outstanding way to promote one’s health, wellbeing, and endurance. I will likely have to take a rain check on this year’s midnight run – but I will certainly be there in spirit and hope you get there in body and soul!

A Look Back To ARRA and a Case for the Future

As we enter the season of national acrimonious political debate and accusations of what has worked and not worked to improve the economic downturn that began in 2008, I was pleased to receive a recent analysis of the impact of ARRA funding on the Stanford University School of Medicine. You will recall that the American Recovery and Reinvestment Act of 2009 committed significant funding to the National Institutes of Health to promote discovery, innovation and job creation (see: http://deansnewsletter.stanford.edu/archive/02_23_09.html). Along with medical schools and academic health centers across the nation, Stanford faculty competed for ARRA funding. While we have assessed the impact of this funding at prior points in time, the most recent survey was done in 2012. It sought to assess the impact of ARRA funding on job creation and job retention and on the advancement of science.

The survey questionnaire was administered by our Office of Institutional Planning and was sent to the 141 Principal Investigators who had, in total, received ARRA funding for 241 grants amounting to \$123 million in support. The questionnaire had a 91% response rate. Overall some 21% of School of Medicine full-time faculty received an ARRA grant. The impact of the funding is notable: according to the PIs surveyed, 232 jobs were created – nearly 1.8 jobs per PI, and, of these, 180 have been retained. Also important is

the fact that some 210 individuals already employed kept their jobs as the result of ARRA funding to Stanford PIs – the majority at Stanford (56%), the rest in other academic settings or in industry or government. Nationally, the NIH has estimated that some 50,000 jobs were created or retained as a result of ARRA funding.

In addition to creating or preserving jobs, the ARRA funding received by Stanford faculty had a tremendous impact on scientific productivity. Over 270 scientific publications in major journals (nearly 2.2 per PI) have resulted from ARRA funding. Further, work supported by ARRA has resulted in a number of inventions as well as the creation of new companies and has also led to follow-up funding from NIH and other granting agencies. Both in the creation of jobs and in the creation of new knowledge, ARRA has had a clear and important impact – on Stanford and our community, locally and beyond. This is not really a surprise, since a number of studies have demonstrated the impact of biomedical research on economic vitality as well as in the creation of new knowledge and, over time, improvements in health and the treatment and prevention of disease.

Our nation's investment in biomedical research, largely through the National Institutes of Health, has made the US a world leader in the biosciences and medicine. Sadly, except for the ARRA funding, we are now approaching a decade of time during which NIH funding has been flat to declining– with major decrements in biomedical purchasing power. The long-term consequences of these declining investments in research are enormous and tragic, especially given the extraordinary opportunities that abound. Even for the most seasoned and successfully NIH funded faculty, concerns about the future are serious and highly worrisome. In addition to the amount of time spent in writing grants and exploring new funding sources, the ability to propose the most creative and innovative research becomes a question mark when study groups and research councils focus on more of what is achievable than what can be imagined. Of course, our broad institutional fears are heightened as we move toward the year's end and the prospect of a federal budget sequestration that could result in across the board reductions in research funding. If executed this will have a further damaging effect on our research mission – as well as our faculty and students.

Continuing our advocacy and support for basic research must remain at the very top of our goals and initiatives – and hopefully, it will for our national leaders as well. The case for support is clear and even though we face numerous economic challenges, investing in biomedical research has payoffs in every dimension, including our leadership as a nation in innovation and discovery.

Upcoming Events: Future of Health Care in American: New Hopes, New Fears

Friday September 14, 2012
2:30 – 4:00 P.M.
Rm. 130, Li Ka Shing Center
291 Campus Drive

This Stanford Health Policy Forum on September 14, will focus on where our health care system is succeeding, where it is failing and where it is going in the future with speakers Dr. Ezekiel Emanuel, the Chair of Medical Ethics and Health Policy at the University of Pennsylvania. This discussion will conclude with a dialogue with the audience. For more information, visit: <http://healthpolicyforum.stanford.edu/>

Awards and Honors

- **Dr. Camran R. Nezhat**, Adjunct Clinical Professor of Obstetrics and Gynecology and of Surgery, is the 2012 recipient of the Mentor Award of the College of Obstetrics and Gynecology.
- **Dr. Mark D. Pegram**, Director of the Breast Cancer Oncology Program at the Stanford Women's Cancer Center, became the inaugural holder of the Susy Yuan-Huey Hung Professorship at a lovely ceremony on Monday evening, August 20th. This new professorship was made possible by an estate gift from Ms. Susy Hung, who died in 2010 and who was dedicated to education, medicine and cancer, along with a major gift from Jill and John Freidenrich. We are deeply grateful to the Hung family for their donation and continuingly grateful to the Freidenrich family, without whom this professorship could not have been established. The Freidenrich gift is even more meaningful in that they elected not to receive any naming acknowledgement in the professorship – allowing it instead to honor the memory of Suzy Yuan-Huey Hung. The Hung family and the Freidenrich family are united in their support for breast cancer research and treatment – which will now be further advanced by this new professorship. Thus, special thanks go to the Hung and Freidenrich families.
- Please also join me in congratulating Dr. Pegram and Dr. Nezhat..

Appointments and Promotions

Jennifer Andrews has been appointed to Clinical Assistant Professor of Pathology and of Pediatrics, effective 7/16/2012

Raffi S. Avedian has been reappointed to Assistant Professor of Orthopaedic Surgery, effective 10/01/2012

Mehrdad Ayati has been promoted to Clinical Assistant Professor of Medicine, effective 6/16/2012

Brooks A. Bahr has been promoted to Clinical Assistant Professor of Dermatology, effective 7/1/2012

Sowmya Balasubramanian has been appointed to Clinical Assistant Professor of Pediatrics, effective 8/15/2012

Courtenay Barlow has been appointed to Clinical Assistant Professor of Pediatrics, effective 9/1/2012

Juliana Barr has been reappointed to Associate Professor of Anesthesia, effective 7/01/2012

Sanjay Basu has been appointed to Assistant Professor of Medicine, effective 9/01/2012

Anne Benham has been appointed to Clinical Professor of Psychiatry and Behavioral Sciences, effective 7/1/2012

David A. Bergman has been reappointed to Associate Professor of Pediatrics, effective 8/01/2012

Nancy A. Bitar has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 5/1/2012

Brian Blackburn has been reappointed to Clinical Assistant Professor of Medicine, effective 9/1/2012

Mark Boddy has been appointed to Clinical Associate Professor of Obstetrics and Gynecology, effective 9/25/2012

Clark A. Bonham has been reappointed to Associate Professor of Surgery, effective 8/01/2012

Rondeep Brar has been appointed to Clinical Assistant Professor of Medicine, effective 9/1/2012

Maurice Buchbinder has been appointed to Clinical Professor of Medicine, effective 7/1/2012

Sang-ick Chang has been appointed to Clinical Professor of Medicine, effective 8/1/2012

Aarti Chary has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 7/1/2012

Adam De la Zerda has been appointed to Assistant Professor of Structural Biology effective 8/01/2012

Jun Ding has been appointed to Assistant Professor of Neurology and Neurological Sciences, effective 8/01/2012

Robert Dodd has been reappointed to Assistant Professor of Neurosurgery and of Radiology, effective 8/01/2012

Katherine Eisen has been promoted to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 7/1/2012

Tarek El-Sawy has been appointed to Clinical Assistant Professor of Ophthalmology, effective 8/1/2012

William O. Faustman has been reappointed to Clinical Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 9/1/2012

Dean Felsher has been promoted to Professor of Medicine and of Pathology, effective 8/01/2012

Daniel C. Garza has been reappointed to Assistant Professor of Orthopaedic Surgery and of Surgery, effective 8/01/2012

Gregory H. Gilbert has been reappointed to Clinical Assistant Professor of Surgery, effective 9/1/2012

Aaron Gitler has been appointed to Associate Professor of Genetics, effective 7/01/2012

Kevin Graber has been promoted to Clinical Associate Professor of Neurology & Neurological Sciences, effective 8/1/2012

Susan Hintz has been promoted to Professor of Pediatrics, effective 6/01/2012

Michelle Holmes has been reappointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 9/1/2012

Robert Horowitz has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 11/1/2009

Joyce J. Hsu has been reappointed to Clinical Assistant Professor of Pediatrics, effective 7/1/2012

James Kahn has been appointed to Professor of Medicine, effective 7/01/2012

Fahd R. Khan has been promoted to Clinical Assistant Professor of Neurosurgery, effective 7/21/2012

Sarita Khemani has been appointed to Clinical Assistant Professor of Medicine, effective 8/13/2012

Holbrook Kohrt has been appointed to Assistant Professor of Medicine, effective 8/01/2012

Michael (Zach) Koontz has been appointed to Clinical Assistant Professor of Medicine, effective 9/1/2012

Marc B. Lee has been reappointed to Clinical Assistant Professor of Neurosurgery, effective 9/1/2012

Peter Lee has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2011

Steven Long has been appointed to Clinical Associate Professor of Pathology, effective 7/1/2012

Peter Li has been appointed to Clinical Assistant Professor of Otolaryngology – Head & Neck Surgery, 9/1/2012

Geoffrey Lighthall has been reappointed to Associate Professor of Anesthesia, effective 8/01/2012

Sermsak (Sam) Lolak promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 8/1/2012

Jennifer McNab has been appointed to Assistant Professor (Research) of Radiology, effective 10/01/2012

Katherine Mackenzie has been promoted to Clinical Assistant Professor of Neurology & Neurological Sciences, effective 10/1/2012

Samuel A. Mireles has been reappointed to Clinical Assistant Professor of Anesthesia, effective 9/1/2012

Erik Mittra has been promoted to Clinical Assistant Professor of Radiology, effective 8/1/2012

Kara Motonaga has been promoted to Clinical Assistant Professor of Pediatrics, effective 8/1/2012

Jose G. Montoya has been promoted to Professor of Medicine, effective 8/01/2012

Judith A. Murovic has been promoted to Clinical Assistant Professor of Neurosurgery, effective 8/1/2012

Donald M. Olson has been reappointed to Associate Professor of Neurology and Neurological Sciences, effective 10/01/2012

Charles Owyang has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 7/1/2012

Jonathan P. Palma has been appointed to Clinical Assistant Professor Pediatrics, effective 7/1/2012

Judith Prochaska has been appointed to Associate Professor of Medicine, effective 7/01/2012

Daryn Reicherter has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 7/1/2012

Echo Rowe has been reappointed to Clinical Assistant Professor of Anesthesia, effective 9/1/2012

Erika Rubesova has been promoted to Clinical Associate Professor of Radiology, effective 8/1/2012

Jeannie L. Seybold has been reappointed to Clinical Assistant Professor of Anesthesia, effective 2/1/2013

Davud Sirjani has been reappointed to Clinical Assistant Professor of Otolaryngology – Head & Neck Surgery, effective 7/31/2012

Patrick David Soran has been reappointed to Clinical Assistant Professor of Anesthesia, effective 10/1/2012

Matthew Strehlow has been promoted to Clinical Associate Professor of Surgery, effective 7/1/2012

Christopher Ta has been promoted to Professor of Ophthalmology, effective 8/01/2012

Joyce Teng has been appointed to Clinical Associate Professor of Dermatology and of Pediatrics, effective 7/15/2012

Wendy T. Thanassi has been reappointed to Clinical Assistant Professor of Surgery, effective 9/1/2012

Allison L. Thompson has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 7/1/2012

Chih-Hung (Jason) Wang has been appointed to Associate Professor of Pediatrics, effective 7/01/2012

William P. Wilkes has been appointed to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 7/1/2012

Sanno E. Zack has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 7/1/2012

Michelle Zebrack has been promoted to Clinical Associate Professor of Pediatrics, effective 7/1/2012

Dean's Newsletter

September 10, 2012

Dr. Jim Spudich Wins the 2012 Albert Lasker Basic Medical Research Award

This morning the Albert and Mary Lasker Foundation announced that Dr. Jim Spudich, the Douglass M. and Nola Leishman Professor at Stanford, is the winner of the 2012 Albert Lasker Basic Medical Research Award. Dr. Spudich shares this prize with Dr. Ron Vale, the William K. Hamilton Distinguished Professor of Anesthesia and Professor and Chair of Cellular and Molecular Pharmacology at the University of California, San Francisco and Investigator, Howard Hughes Medical Institute, and Dr. Michael Sheetz, the William P Kenan Jr. Professor, Biological Sciences, Columbia University. This incredibly prestigious award recognizes Jim Spudich's seminal contributions to understanding how molecular motors transduce the chemical energy of ATP hydrolysis into mechanical movement in muscle and nonmuscle cells (see: Stanford press release: "[Lasker Award Goes to Biochemist Jim Spudich](#)"). His pioneering work and collaborations have crossed many scientific disciplines and forged interdisciplinary research collaborations by biochemists, structural biologists, physicists, chemists and others.

Dr. Spudich's research elucidates fundamental biological systems and is elegant in its own right but also has implications for treatment of human disease. Indeed, clinical trials are now underway utilizing several drugs that are based on applying his insights about how cells contract to problems like heart failure, amyotrophic lateral sclerosis and aging, to name a few. His work underscores the importance of investing in basic research as a fundamental underpinning for understanding and ultimately improving the human condition.

Equally important, Jim Spudich is not only a great scientist but also a visionary leader. An extension of his research with Steve Chu, now Secretary of the Department of Energy but formerly Professor of Physics at Stanford, led to the seminal thinking for what has now become BioX – which carries on the tradition of interdisciplinary research and education that has characterized Jim Spudich's own work. Jim is also a wonderful colleague and university citizen, deeply admired by colleagues and students worldwide. It is thrilling to congratulate Jim Spudich, and his colleagues Ron Vale and Michael Sheetz, as winners of the 2012 Albert Lasker Medical Research Award. Jim will officially receive the Lasker Award at a ceremony in New York City on September 21st, where

family and friends will join him for this wonderful honor. We will also have a reception to honor Jim Spudich and Ron Vale on Thursday, September 13 at 4 p.m. at the Dean's Courtyard at the Alway Building.

Dr. Bobby Robbins Will Leave Stanford to Become the President and CEO of the Texas Medical Center

Dr. Robert (Bobby) Robbins has been a major leader at Stanford University School of Medicine, where he has served as both Chair of the Department of Cardiothoracic Surgery and, since 2005, Director of the Stanford Cardiovascular Institute. While we must be proud of the wonderful opportunity he has been given to lead the Texas Medical Center (TMC), Bobby will be deeply missed by our entire community - a sentiment I very much share. According to the Texas Medical Center news release, Bobby was selected from a large pool of potential candidates to lead TMC, which has grown since it was established in 1945 to become the largest medical complex in the world. It is composed of 52 member institutions from Houston to Galveston whose mission is to "improve the health status of people through research, education, patient care and prevention." Bobby will begin his new role on November 5th.

Ever since he joined Stanford as a resident more than two decades ago, Bobby Robbins' accomplishments have spanned across all our missions - each with notable success. Bobby is a highly regarded cardiac surgeon known worldwide for his expertise in heart transplantation. His accomplishments in research have been outstanding and have attracted major awards from the NIH and the California Institute of Regenerative Medicine. He has led a pioneering transformation in the training of future cardiac surgeons. His leadership has won him wide respect among both clinical and basic science chairs and faculty, and his role in establishing the Cardiovascular Institute at Stanford has created amazing bridges and connections across the Medical Center and University and deep into our community. Bobby's affection for sports and commitment to them are legendary, and his charismatic personality and people skills are deeply valued and respected. Bobby's commitment to his family and to his many colleagues and friends has created a rich network that will long be sustained. I have been privileged to count Bobby Robbins as a colleague and leader for nearly a dozen years and have been enriched through his friendship - especially his love of Stanford. We look forward to his future success and leadership in academic medicine and beyond.

The LCME Accreditation Review Is Now Scheduled for October 2013

I want to call to your attention the fact that in October 2013 the Liaison Committee on Medical Education (LCME), the accrediting body for education programs leading to the Doctor of Medicine (MD) degree in the United States and Canada, will hold its official site visit to Stanford. Needless to say, a successful accreditation is critical to the School of Medicine and is among the highest priorities for the School of Medicine over the next year. Preparations for the LCME review often begin years in advance of the official site visit and are significantly intensified by the "institutional self-study" that begins during the year prior to the visit. With that in mind, an orientation meeting for the LCME 2013

Accreditation Review was held on Monday August 27th. Your commitment and dedication throughout this process will ensure our continued excellence and leadership in medical education. As you also know, Dr. Lloyd Minor will succeed me as Dean beginning December 1, 2012, and he will take over the leadership of the LCME Institutional Task Force through the October 2013 review. I will do everything possible to make sure our transition is smooth and successful for our Stanford community.

By way of background, the LCME, which was formed in 1942, includes 19 voting members and is jointly sponsored by the American Medical Association (AMA) and the Association of American Medical Colleges (AAMC). Members of the LCME include medical professionals, students and lay public members. A central facet of the LCME is the aforementioned self-assessment, which includes significant internal data collection related to various education standards and, importantly, an independent student assessment and analysis. This is also an opportunity for institutional self-reflection and strategic planning about current and future education programs and initiatives. The most recent LCME site visit was in 2005. The official review of that visit was reported to John Hennessy, President of Stanford University, on March 1st 2006; it identified areas of strength as well as areas needing improvement. Overall it was an extremely positive and successful review, but it also raised issues that the medical school leadership has continued to assess and address in the past seven years.

All of the documents, reviews and updates of the previous LCME reviews are now posted on our website (see: <http://med.stanford.edu/lcme/>). There are a number of documents for public viewing but official reports from the LCME (including our past submissions and self study and the LCME report) require a SUNet ID for access and can therefore be viewed by members of the Stanford community. We are sharing these documents to promote transparency and also to do all we can to improve our environment for the continued and future education of students.

As noted, over the 2012-2013 academic year (and already underway), many of our faculty, trainees, staff, and clinical partners will be actively engaged in our institutional self-study. In addition to assuring compliance with the LCME accreditation standards, this is also an important opportunity for members of our diverse community to engage in thoughtful dialogue about our ongoing efforts to improve the quality of our MD educational program. The various committees, their leadership, and milestone timelines are all available on the website (see: <http://med.stanford.edu/lcme/>). Dr. Charles Prober, Senior Associate Dean for Medical Education, is the faculty lead for these accreditation efforts. If you have any questions, please contact one of the members of our LCME Accreditation Planning Team:

- ☐ Charles Prober (cprober@stanford.edu) - Faculty Lead, LCME Accreditation
- ☐ Aarti Porwal (aaporwal@stanford.edu) - Administrative Lead, LCME Accreditation
- ☐ Georgianna Newell (gnewell@stanford.edu) - LCME Project Assistant

I want to thank our faculty, staff and students who are contributing their time and energy to this important process and to encourage you to review the website and offer any comments or suggestions you think helpful or necessary.

Official Groundbreaking Ceremony for the Lucile Packard Children's Hospital Addition

Although construction has been well underway, the official groundbreaking ceremony for the major expansion to the Lucile Packard Children's Hospital (LPCH) was held on September 5th and 6th, signaling another major milestone for this extraordinary resource for children and families – in our community and worldwide. When it is completed in 2016, the \$1.2 billion addition to LPCH will add 150 new patient rooms along with advanced diagnostic and treatment facilities. It will be among the most advanced state-of-the-art facilities in the world.

Christopher Dawes, President and CEO of LPCH, and John Etchemendy, Provost of Stanford University, presided over the event, at which both parents and children gave voice to the importance of LPCH to the lives of children and families. The partnership that LPCH has with Stanford contributes significantly to its uniqueness, distinction and opportunities for the future.

Children's hospitals have played an extraordinary role in transforming the health of children since they were founded during the Dickensian period in London (the Great Ormond Street Hospital being the first) and in Philadelphia, Boston, and Chicago in the US. Often founded by community members, these institutions have provided a haven for children and have been the font of discovery that has transformed the diagnosis and treatment of virtually every congenital or acquired illness over the past 160 years. The foundations for pediatric surgery, diagnostic testing and the cures for diseases like cancer and organ transplantation had their origins and champions in children's hospitals. They have been the focal point for training pediatric specialists and care providers of every medical and surgical or related disciplines, creating generations of leaders, physician scientists, clinicians, advocates and policy makers.

Over the past 50 years a number of the major independent children's hospitals in the US have become as large and complex as academic medical centers, embracing all the missions of research, education, and patient care. While the benefits have been extraordinary, we are also at a remarkable point in history when future scientific and clinical insights will require interactions and collaborations that extend well beyond traditional disciplinary boundaries. As such, a number of our nation's most prominent children's hospitals run the risk of become too insular and self-contained – a topic I addressed in a presentation to the American Pediatric Society in April 2012 (see: <http://www.nature.com/pr/journal/v72/n3/full/pr201283a.html>).

This is where the collaboration between LPCH and Stanford become ever more important. As a children's hospital, LPCH is really an island with bridges to the Stanford University Medical Center, including both its basic and its clinical science faculty and community. It also has many bridges to Stanford University that foster opportunities for

engaging the social sciences as well as the biosciences and engineering. It has bridges to Stanford's Schools of Education, Law, Business and, importantly the community of Silicon Valley and beyond. As such the alignment of LPCH with Stanford creates a unique children's hospital for the future and creates opportunities that can be transformative for the future of child health and the health of families throughout the life cycle.

Revised and Updated Policies on Conflict of Interest

Policies and regulations regarding compliance, including conflicts of interest, have continued to evolve and emerge over the past two decades and now encompass virtually every mission of our university and medical center. With the recent conflict of interest mandates from the National Institutes of Health, Stanford's policies have been reviewed, renewed and now aggregated under a single website (see: <http://www.stanford.edu/group/coi/index.html>). I encourage you to review the web site to make sure you are aware of any changes that affect your activities.

IOM Report on Healthcare Expenditures

With the conventions now ended, the heated national debate for the presidency in the US will almost surely focus on healthcare from very different perspectives. Regardless of the political debate, the reality is that healthcare costs in the US continue to rise at unsustainable rates and that serious and significant changes and solutions are needed. The Affordable Care Act is a beginning but much more is needed to control costs and to improve healthcare delivery in the US. This week the Institute of Medicine released a report from an expert panel entitled "Best Care at Lower Cost: The Path to Continuously Learning Health Care in America" (see: <http://www.iom.edu/Reports/2012/Best-Care-at-Lower-Cost-The-Path-to-Continuously-Learning-Health-Care-in-America.aspx>).

While there will continue to be many points of view, the IOM report is likely to provoke debate and discussion. Two features of the report are relevant at a high level – both available online. One is a table of what the Committee views as "Characteristics of a Continuously Learning Health Care System" that focuses on:

- **Science and Informatics**
 - Real-time access to knowledge
 - Digital capture of the care experience
- ***Patient-Clinician Relationships***
 - Engaged, empowered patients
- ***Incentives***
 - Incentives aligned for value
 - Full transparency
- ***Culture***
 - Leadership-instilled culture of learning
 - Supportive system competencies

This assessment is coupled with the observation that wasted health care spending can be linked to unnecessary services, excessive administrative costs, fraud, and other problems. The IOM report notes that “the traditional systems for transmitting new knowledge—the ways clinicians are educated, deployed, rewarded, and updated—can no longer keep pace with scientific advances. If unaddressed, the current shortfalls in the performance of the nation's healthcare system will deepen on both quality and cost dimensions, challenging the well-being of Americans now and potentially far into the future.” Based on that observation, the report offers ten recommendations for improving healthcare, including addressing:

Digital Infrastructure: "Improve the capacity to capture clinical, care delivery process and financial data for better care, system improvement and the generation of new knowledge."

Data Utility: "Streamline and revise research regulations to improve care, promote the capture of clinical data and generate knowledge."

Clinical Decision Support: "Accelerate integration of the best clinical knowledge into care decision."

Patient-Centered Care: "Involve patients and families in decisions regarding health and health care, tailored to fit their preferences."

Community Links: "Promote community-clinical partnerships and services aimed at managing and improving health at the community level."

Care Continuity: "Improve care coordination and communication within and across organizations."

Optimized Operations: "Continuously improve health care operations to reduce waste, streamline care delivery and focus on activities that improve patient health."

Financial Incentives: "Structure payment to reward continuous learning and improvement in the provision of best care at lower cost."

Performance Transparency: "Increase transparency on health care system performance."

Broad Leadership: "Expand commitment to the goals of a continuously learning health care system."

While important, this report from the IOM is one of many perspectives on how to address health care in the US – but it is one worth reviewing.

Health Policy Forum Will Feature Dr. Zeke Emmanuel – Friday, September 14

On Friday, September 14th, the Stanford Health Policy Forum will feature a conversation with Dr. Zeke Emmanuel on “The Future of Health Care in America: New Hopes, New Fears.” Dr. Emmanuel is the Vice Provost for Global Initiatives, the Diane VS Levy and Robert M. Levy University Professor and Chair of the Department of Medical Ethics and Health Policy at the University of Pennsylvania. Dr. Emmanuel also served as the Special

Advisor on Health Policy to the Director of the Office of Management and Budget and the National Economic Council in the White House. The conversation will be moderated by Paul Costello, Chief Communications Officer for the School of Medicine, and will be held in Room 130 in the Li Ka Shing Center for Learning and Knowledge from 2:30 – 4:00 pm on Friday, September 14th.

Memorial Service for Dr. Robert Glaser (Dean 1965-1970) - October 8th

On Friday, October 8th a Memorial Service will be held to honor the life and contributions of Dr. Robert Joy Glaser (1918-2012), who served as Dean of the School of Medicine from 1965-1970. The service will begin at 4:00 pm in the Paul and Mildred Berg Hall of the Li Ka Shing Center for Learning and Knowledge. Please feel free to attend.

Counting Down on Dean's Newsletters

Since arriving at Stanford in 2001 I have shared a “Dean’s Newsletter” on a nearly biweekly schedule as a means of sharing updates and undertakings as well as a way of getting feedback and comments from our Stanford community. It has been an honor to share thoughts and observations about the progress, challenges and opportunities for Stanford Medicine. Quite obviously I am now in the countdown phase with just a couple of issues remaining. This may be a relief to many in our community – but it has been a privilege to share these communications with you.

Upcoming Event

22nd Annual Jonathan King Lectureship: **The Ethics and Practice of Loving Care**

Tuesday, October 2nd

5:30 pm

Lucile Packard Children’s Hospital, Auditorium, 1st floor

This lecture is free and open to the public

Speaker: Ira Byock, MD, is Chair, Palliative Medicine, at the Geisel School of Medicine at Dartmouth, Director of Palliative Medicine, Dartmouth-Hitchcock Medical Center, and Professor, the Geisel School of Medicine at Dartmouth in the Departments of Medicine, Anesthesiology, and Community and Family Medicine. Involved in hospice and palliative care since 1978, Dr. Byock has authored numerous articles and several books on the ethics and practice of hospice, palliative and end-of-life care.

Awards and Honors

- **Dr. Anand Veeragu** has been appointed to the 2012-2013 Class of White House Fellows. The White House Fellows Program was created in 1964 by President Lyndon B. Johnson to give promising American leaders “first hand, high-level experience with the workings of the Federal government, and to increase their sense of participation in national affairs.” Selection as a White House Fellow is highly competitive and is a significant honor.

The citation regarding Dr. Veeragu from the White House Fellows Program (see: at www.whitehouse.gov/fellows) notes that Anand Veeragu “is a Neurosurgeon in training at Stanford University SOM. He most recently served as Chief Neurosurgery Resident at the Palo Alto Veterans Affairs Hospital caring for soldiers returning from Afghanistan with traumatic brain and spinal cord injuries. Anand is focused on advancing minimally invasive diagnostic and surgical techniques for diseases of the central nervous system. In 2006, Anand developed a novel radiotherapeutic to treat Glioblastoma Multiforme, a malignant brain tumor. He has published over 50 peer-reviewed scientific manuscripts and has written for the Huffington Post. In 2011 Anand staffed the CURE Neurosurgical Hospital in Uganda and organized medical relief missions for the Tsunami of 2004. Anand has received over 30 awards for his leadership, research and promotion of healthcare access to underserved populations. In 2012 Anand received the Gold Foundation's Humanism and Excellence in Teaching Award for his commitment to mentorship.

Anand’s research employs national databases to evaluate trends in health resource utilization to provide guidelines for policy reform. Anand has been accepted to the Stanford GSB MBA program, received his M.D. from Stanford University and graduated with honors from Johns Hopkins University with a B.S in Biomedical Engineering and minor in Multicultural and Regional Studies.” Please join me in congratulating Dr. Veeragu.

Appointments and Promotions

Janelle Aby has been reappointed to Clinical Associate Professor of Pediatrics, effective 10/1/2012

Arash Anoshiravani has been promoted to Clinical Assistant Professor of Pediatrics, effective 9/1/2012

Nawal Atwan has been promoted to Clinical Assistant Professor of Medicine, effective 8/16/2012

Michael J. Bresler has been reappointed to Clinical Professor of Surgery, effective 9/1/2012

Sangetta Chona has been reappointed to Clinical Assistant Professor of Surgery, effective 9/1/2012

Rebecca E. Claure has been promoted to Clinical Associate Professor of Anesthesia, effective 9/1/2012

Glenn Cockerham has been reappointed to Clinical Associate Professor (Affiliated) of Pathology and of Ophthalmology, effective 3/1/2012

Beth Darnall has been appointed to Clinical Associate Professor of Anesthesia, effective 10/1/2012

Glen R. Elliott has been reappointed to Clinical Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 9/1/2012

Jordan Firestone has been promoted to Clinical Associate Professor of Medicine, effective 9/1/2012

Deborah Franzon has been promoted to Clinical Associate Professor of Pediatrics, effective 11/1/2012

Norman W. Gross has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 9/1/2012

Terri Haddix has been promoted to Clinical Associate Professor of Pathology, effective 9/1/2012

Parag Kale has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 3/1/2012

Amid Keshavarzi has been promoted to Clinical Assistant Professor (Affiliated) of Surgery, effective 9/1/2012

Edward Klofas has been reappointed to Clinical Associate Professor of Surgery, effective 9/1/2012

Justin M. Ko has been appointed as Clinical Assistant Professor of Dermatology, effective 9/1/2012

Bernice Y. Kwong has been appointed as Clinical Assistant Professor of Dermatology, effective 9/1/2012

Joel Levis has been promoted to Clinical Assistant Professor (Affiliated) of Surgery, effective 9/1/2012

Lauren S. Maeda has been appointed as Clinical Assistant Professor of Medicine, effective 9/1/2012

Morvarid Moayeri has been appointed to Clinical Assistant Professor of Pathology, effective 9/16/2012

Pramela Ramachandran has been promoted to Clinical Associate Professor of Pediatrics, effective 9/1/2012

S. Goney Sandhu has been appointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 6/1/2012

Sen, Subhro – has been reappointed to Clinical Assistant Professor of Surgery, effective 9/1/2012

George S. Sternbach has been reappointed to Clinical Professor of Surgery, effective 9/1/2012

John M. Stevenson has been reappointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 9/1/2012

Anne Elizabeth Stuart has been promoted to Clinical Professor of Pediatrics, effective 9/1/2012

Volney Van Dalsem has been promoted to Clinical Professor of Radiology, effective 9/1/2012

Mytilee P. Vemuri has been reappointed to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 8/1/2012

David Wang has been promoted to Clinical Assistant Professor of Radiology, effective 9/1/2012

Ellen Y. Wang has been promoted to Clinical Assistant Professor of Anesthesia, effective 9/1/2012

Martin K. Wong has been reappointed to Clinical Associate Professor (Affiliated) of Obstetrics and Gynecology, effective 9/1/2012

Tonia E. Wroolie has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 9/1/2012

Laraine Zappert has been reappointed to Clinical Professor of Psychiatry and Behavioral Sciences, effective 5/1/2012

Dean's Newsletter

September 24, 2012

Dr. Lucy Shapiro Wins the 2012 Horwitz Prize

Columbia University announced today that its 2012 Louisa Gross Horwitz Prize is being awarded to Dr. Lucy Shapiro, the Virginia and DK Ludwig Professor and Director of the Beckman Center at Stanford University (<http://med.stanford.edu/ism/2012/september/brief-shapiro-0924.html>). This the 45th year since this prestigious award was established; over those years, 42 of the 87 Horwitz Prize winners have gone on to win the Nobel Prize. Dr. Shapiro shares this year's prize with Drs. Richard Losik of Harvard University and Joe Lutkenhaus of the University of Kansas.

The announcement of the award cites Dr. Shapiro's seminal work on "how one-dimensional DNA can encode and be translated into a complex three-dimensional organism. She showed, for the first time, that bacterial DNA replication occurs in a spatially organized way and that cell division depends on this spatial organization and on segregation of the DNA to opposite ends of the cell. She also showed that the cell cycle requires the precise coordination and timing of multiple biochemical and morphological events, each of which occurs at a specific stage in the cell cycle and requires the expression and function of a discrete set of genes."

Not only has Dr. Shapiro's work elucidated incredibly important biological insights, but, in doing so, she and her collaborators have also defined and utilized the field of systems biology. As a result of bringing together physicists, engineers, biologists, computational scientists and more into this new field, she and her colleagues have moved it forward with startling speed and impact. Her work embodies and embraces the unique intersections of the physical and life sciences at Stanford – and was evidenced in her seminal contributions to making BioX so much a part of the Stanford landscape.

I would hasten to add that Dr. Shapiro is not only an incredible scientist, well deserving of the 2012 Horwitz Award, along with the many other awards that preceded it and that are yet to come, but she is also a remarkable leader at Stanford and around the world. Dr. Shapiro stands for excellence in all that she does – and she has worked tirelessly and often behind the scenes to bring excellence to our community in virtually every dimension we value and celebrate. Please join me in congratulating Dr. Shapiro as the 2012 Louisa Gross Horwitz Prize winner.

Stanford School of Medicine Receives the Alfred P. Sloan Award for Excellence in Faculty Career Flexibility

The American Council on Education and the Alfred P. Sloan foundation announced today that the Stanford University School of Medicine is the recipient of the Alfred P Sloan Award for Excellence in Faculty Career Flexibility (<http://med.stanford.edu/ism/2012/september/flexibility-0924.html>). This award

recognizes Stanford's leadership and progressive policies and its commitment to enhance and develop flexible career paths for its faculty. The award is based on "*Academic Biomedical Career Customization (ABCC): An integrated approach to faculty career flexibility*." This highly innovative program was developed by Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership and Professor of Medicine; Dr. Christy Sandborg, Vice President of Medical Affairs, the Lucile Packard Children's Hospital at Stanford and Professor of Pediatrics; Dr. Jennifer Raymond, Associate Dean for Faculty Flexibility and Associate Professor of Neurobiology; Dr. Caroline Simard, Associate Director of the Office of Diversity and Leadership (ODL); and Jennifer Scanlin, Program Manager, ODL. The award provides \$250,000 to further develop a pilot plan that has been initiated by Dr. Valantine and her colleagues to develop new approaches to creating more flexible career opportunities for both basic and clinical faculty in the School of Medicine. Stanford was one of five medical schools to receive an excellence award for faculty career flexibility and will be honored at an event on September 24th in Washington DC.

Stanford is already a leader in having a number of policies promoting flexibility, including ones for parental leave, reduced teaching or clinical load, family care, part-time appointment, tenure clock extension and personal disability. Despite having these and other policies a major concern is that, with the exception of maternity leave and part-time appointments, a number of these progressive policies are either unrecognized or underutilized by faculty. Not surprisingly, among the major reasons for not using flexible work policies is the fear of seeming to be less committed to one's career or a concern about burdening one's colleagues. This is a topic about which I have written frequently over the years (see: http://deansnewsletter.stanford.edu/archive/05_31_04.html#1, http://deansnewsletter.stanford.edu/archive/07_26_10.html#3, http://deansnewsletter.stanford.edu/archive/01_24_11.html,

As Dr. Valantine and her colleagues have noted on a number of occasions, although flexibility is a pressing issue for institutions across all sectors, as evidenced by Ann-Marie Slaughter's recent article about her decision to opt-out of a prestigious position in government, <http://www.theatlantic.com/magazine/archive/2012/07/why-women-still-cant-have-it-all/309020/2/>), few have offered definitive plans to solve the problem. The School of Medicine recognizes that to recruit and retain the best and brightest, we need to align our organizational practices and culture to the needs of the 21st century workforce. Hopefully the Sloan Award will allow the School of Medicine to move forward with the initial phases of pilot ABCC projects that will begin in both basic science and clinical science departments. The model is organized around teams of faculty members who will work collaboratively with division chiefs or department chairs, assisted by professional career-life coaches, to create individual faculty career plans that evolve over time and ensure that faculty actually use existing and newly designed flexibility options to enhance work life integration. A key goal is to collect data and assess the impact of the ABCC methodology and determine whether and how it can be more widely employed in the years ahead.

There is a lot at stake for our faculty. Our work environment is supportive (note that Stanford was named this week by the “Working Mother” as one of the 100 Best Companies fostering a balance between work and family life (see: <http://www.workingmother.com/best-companies/stanford-university>), but there is much work to do, especially for junior clinical faculty, who are trying to balance the often competing pressures of achieving excellence in research, teaching, patient care and family life. Making progress in this area is important to our current faculty and to future generations. It is wonderful that the work already accomplished or underway has been recognized by the Council on Education and the Alfred P Sloan Foundation, but we are really at the beginning of a long journey. Thankfully, Drs. Valantine, Sandborg, Raymond, Simard and Ms. Scalin are ready to initiate new and novel programs that may help create a better future. We congratulate their accomplishments – and more importantly, wish them well in these future endeavors.

Challenges at Stanford from Different Perspectives: Views from the Faculty Senate

The School of Medicine’s Faculty Senate held its first meeting of the year on September 20th. Dr. Sabine Girod, Associate Professor of Surgery (Plastic and Reconstructive Surgery), is the new chair of the Senate. During the meeting she asked the faculty senators to introduce themselves and to offer personal perspectives on what they hope the senate and school will work on in the year ahead. It was helpful and important to hear the range of views and topics of interest to faculty, students and trainees as they offered individual perspectives as well as collective wisdom. They also reflected on issues and concerns affecting each of our faculty –obviously seen through an individual lens.

Among the concerns raised was how the school and university will support and assist basic science faculty during this time of fiscal constraint and limitation in research funding. Coupled with this was how career development will be supported and fostered at Stanford. Senators expressed concern about the perceived value of Clinician Educators in comparison to other faculty, as well as how medical school faculty are seen in relation to the greater university. One or more senators raised the question of whether Stanford is preparing its medical students for the dramatically changing landscape in how medical care will be delivered. Also raised was the issue of whether education programs promoting joint degrees have had an impact on medicine, and how this fits into the education of future physicians. Questions (and hopes) were raised about how to develop more interdisciplinary interactions among departments and across the university. Also raised was the question of how to engage more faculty involvement in improving the quality and cost-effectiveness of patient care. And the list could go on.

Of note, many of the issues and concerns expressed by this year’s senators have been topics that have been raised in the past, and a number have received considerable attention during my association with Stanford. Indeed, a number have consumed the time and efforts of previous members of the faculty senate, medical school and university. Clearly none are fully resolved, which underscores the reality of the continued external and internal forces that impact academic medicine. Further, the importance of these forces will almost certainly be further exacerbated in an era when NIH funding is flat to declining and when the economics and changes in healthcare alter the overall practice of

medicine. Taken together, the various issues and concerns raised by members of the senate highlight the fact that the work of improving our work environment, locally and beyond, is constant and ongoing – sometimes with two steps forward to one back and on other occasions the opposite.

On further reflection, the expressions by members of the Senate of what we can do to further improve Stanford as a medical school and medical center illustrate that each of us, whether faculty, student or staff, has an individual responsibility to seek ways of helping to address concerns and offer solutions. It is terrific to witness suggestions, comments and of course concerns and disappointments, because they show a willingness to engage in seeking ways of making our community better and stronger. The issues are enduring, and the solutions often more evanescent, with new solutions building on past successes or failures. Obviously there is much to be done – and it is important that the Faculty Senate began by reflecting on some of those challenges and opportunities. Hopefully, next will come steps to solutions – and further progress.

Report to the Executive Committee from the Department of Anesthesiology, Pain and Perioperative Medicine

On Friday September 7th, Dr. Ron Pearl, the Richard K. and Erika N. Richards Professor and Chair of the Department of Anesthesia, provided an update to the Executive Committee, including a change in the department's name. Dr. Pearl's summary follows:

In recognition of the expanding involvement of anesthesiologists outside the operating room, the Department of Anesthesia has been renamed the Department of Anesthesiology, Pain and Perioperative Medicine. Overall, it is one of the three largest departments in the medical school with 155 faculty, 80 residents, 35 fellows, 40 administrative staff, and an additional 50 people involved in research. The annual budget is over \$71 million, primarily in healthcare services and research.

The department has maintained clinical growth at 7% per year throughout the past decade, and now has over 100 clinical FTEs at Stanford and Packard Hospitals. The majority of the faculty growth has been in the Clinician Educator Line, which accounts for over half the current faculty. The department is divided into eight clinical divisions: the general OR group (renamed the multispecialty division), pediatric anesthesia, pain management, critical care, cardiovascular anesthesia, obstetrical anesthesia, and medical acupuncture, plus the VA group. In addition to increasing patient numbers there has been an increase in patient acuity and in the complexity of surgical procedures, which has required increasing sub specialization within the anesthesia divisions. The pain management division has had the greatest percentage growth, and is one of only four programs in the country to receive two Center of Excellence awards from the American Pain Society.

In resident education, the 80 anesthesia residents are involved in 26 rotations at four hospitals. The majority of the residents continue with fellowship training after residency, and half continue in academic anesthesia. The residency program at Stanford has been highly innovative, including an iPad-based curriculum, a research track, a resident

wellness program, a global health program, combined residency programs with pediatrics and with internal medicine, and the extensive use of information technology, simulation, and blended multimedia experiences for training. A Faculty Scholars Teaching Program has trained 26 faculty in curricular theory during the past 5 years. Nationally, simulation in medicine developed from the efforts of David Gaba, Associate Dean for Immersive and Simulation-based Learning at Stanford, and the anesthesia residents participate in simulation programs, often in collaboration with other departments, in anesthesiology, critical care, obstetrics, pediatrics, and neonatology. Many of the departmental educational innovations, including the use of advanced information technology, have been published. Larry Chu organizes the annual Medicine X symposium at Stanford, which is attended by over 500 national and international experts on the use of information technology to advance health care. At the fellowship level, Stanford is the only anesthesia department in the country to offer all five ACGME-approved fellowships (critical care, pain, pediatrics, cardiac, and obstetrical anesthesia).

During the past five years, departmental NIH funding has tripled, and the department now ranks third in the country. The department has 20 active federal awards, including 9 new grants this year, for a total of \$44.3 million in total costs over the award periods. In addition, there are 19 non-federal awards. Overall, there are 21 different principal investigators. Areas of research include pain, mechanisms of anesthesia, neuroscience, cardiopulmonary research, adult and pediatric clinical pharmacology, patient safety, health care economics and outcomes research. Approximately half the departmental research is in the area of pain. A \$17 million P01 grant to Sean Mackey uses deep phenotyping and genotyping to determine which individuals will respond to one of four different treatments for low back pain. Other ongoing pain studies include the use of low dose naltrexone to modulate microglia to decrease pain in fibromyalgia, an EGR-1 DNA decoy to prevent the progression from acute to chronic pain after surgery or injury, the use of brain imaging as an objective marker for pain, and basic mechanisms, including epigenetic modifications, underlying complex regional pain syndrome, postsurgical pain, and response to opioids. In the area of anesthetic mechanisms, electrophysiological studies have examined effects of alcohol and anesthetics on specific ion channels and neural circuits. Modeling of molecular dynamics has described the details of binding between anesthetics and relevant ion channels and has begun to identify new anesthetic molecules that may have greater specificity and safety. A study of identical and fraternal twins demonstrated the role of genetic variability in the effects of narcotics, and subsequent studies will examine candidate genes. The use of computational mouse genetics demonstrated the role of the 5HT₃ receptor in opioid withdrawal, and an NIH-funded multi-center study is examining the use of ondansetron to prevent narcotic drug withdrawal in neonates born to mothers taking narcotic drugs.

Many of the complications of anesthesia and surgery are due to perioperative inflammation. In collaboration with Gary Nolan, Mark Davis, and Mike Longaker, Martin Angst is using CyTOF mass cytometry to perform a comprehensive, system-based quantitative and functional evaluation of the circulating immune system in the context of surgery. Based on data from cytokine changes in the wound fluid of patients, Gary Peltz is studying the ability of anakinra, an IL-1 receptor antagonist, to decrease postoperative wound pain. In other work, his transformative RO-1 uses human hepatocytes to replace

the native liver in Tk-NOG mice, allowing in vivo pharmacokinetic studies applicable to human metabolism and providing a potential method for human liver regeneration from differentiated human adipocytes obtained from liposuction.

Finally, although the Department of Anesthesiology, Pain and Perioperative Medicine has been successful in clinical care, education, and research, resource constraints (money, billets, and space), the impact of new health care reimbursement systems such as accountable care organizations, and the increasing role of mid-level practitioners will need to be addressed to continue this success in future years.

Dr. Natalie Rasgon Appointed Associate Dean of Academic Affairs

Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, has announced the appointment of Dr. Natalie Rasgon, Professor of Psychiatry and Behavioral Sciences, as Associate Dean of Academic Affairs. A member of the Stanford faculty since 2002, Dr. Rasgon holds a courtesy appointment in the Department of Obstetrics and Gynecology and serves as the Director of the Stanford Center for Neuroscience in Women's Health. In addition to her research, teaching and clinical activities, Dr. Rasgon has served on the School's Appointments and Promotions Committee and has just completed a two-year term as chair of the School of Medicine Faculty Senate. She is also co-chair of the Women's Faculty Forum at Stanford. She will join the Office of Academic Affairs on October 1.

Stanford Faculty Continue Amazing Success with Prestigious Awards for Innovation

"Innovative," "creative," and "entrepreneurial" are words that characterize Stanford faculty in ways that transcend virtually every other university in the world. Many different metrics can be used to measure these attributes, some of which occur year after year. For example, on September 13th the NIH announced the 2012 winners of the NIH Director's Pioneer Awards, New Innovative Awards and Transformative Research Awards (see: <http://med.stanford.edu/ism/2012/september/nih-awards-0913.html>). Stanford faculty account for 9 of these 81 awards, which recognize creative and innovative scientists – demonstrating once again that our medical school, as well as the rest of the university, is the beneficiary of enormously talented faculty who themselves benefit from the unique and big-idea thinking that results from the very special environment we know as Stanford. The awardees in the School of Medicine (including Bioengineering) include:

- **NIH Director's Pioneer Award**
 - *Dr. Christina Smolke*, Associate Professor of Bioengineering
 - *Dr. Ann Brunet*, Associate Professor of Genetics
- **New Innovator Awards**
 - *Dr. Alexander Urban*, Assistant Professor of Psychiatry and Behavioral Sciences
 - *Dr. Rajat Rohatgi*, Assistant Professor of Medicine (Oncology)
 - *Dr. Jan Carette*, Assistant Professor of Microbiology and Immunology
- **Transformative Research Awards**
 - *Dr. Karl Deisseroth*, Professor of Bioengineering and of Psychiatry and Behavioral Sciences

- **Dr. Helen Blau**, Donald and Delia B Baxter Professor and Director of the Baxter Laboratory, Department of Microbiology and Immunology
- **Dr. Ben Barres**, Professor and Chair of the Department of Neurobiology

In addition to these prestigious awards from the NIH, the Howard Hughes Medical Institute (HHMI) also announced the recipients of the HHMI Collaborative Innovation Awards, which will bring together six teams to carry out potentially transformative research, each headed by an HHMI investigator. These awards include 28 investigators from 20 institutions in the US, Germany and Israel – including Stanford. Indeed, two of the six teams will be led by (and include) Stanford faculty, including:

Structures of challenging biological systems with the world's first hard X-ray laser

- **Axel Brunger**, Lead Investigator, HHMI Investigator and Professor of Molecular and Cellular Physiology, Neurology, Photon Science and Structural Biology, Stanford University. Dr. Brunger's team will develop new methods of sample delivery, data collection, and analysis to enable structural studies of nanometer or micron-scaled crystals of biological molecules using the new Linac Coherent Light Source at the SLAC National Accelerator Laboratory in California.

Collaborators:

- **James Berger**, University of California, Berkeley
- **David Eisenberg**, HHMI Investigator, University of California, Los Angeles
- **Douglas Rees**, HHMI Investigator, California Institute of Technology
- **William Weis**, William Hume Professor of Structural Biology and of Molecular and Cellular Physiology, Stanford University

Mapping global patterns of connectivity in the mammalian brain

- **Liqun Luo**, HHMI Investigator and Professor of Biology and, by courtesy, of Neurobiology, Stanford University. Dr. Luo's team plans to develop a suite of tools for mapping neuronal connections in the complete mouse brain, including those that extend across long distances, and use those tools to study the organization of neural circuits and how they are affected by specific neurotransmitters.

Collaborators:

- **Edward Callaway**, Salk Institute for Biological Studies
- **Karl Deisseroth**, HHMI Early Career Scientist and Professor of Bioengineering and of Psychiatry and Behavioral Sciences, Stanford University

- **Adi Mizrahi**, Hebrew University

Congratulations to each of these remarkable faculty members for these recent awards and recognition.

Upcoming Events

Stanford Medicine X September 28-30, 2012 Li Ka Shing Center, Berg Hall

This conference will show attendees how emerging technologies will reshape the practice of medicine, right from the front lines of Silicon Valley. Social media, mobile apps, design practices, and self-tracking technologies are reshaping healthcare and have the potential to transform the doctor-patient relationship. In order to engage the Stanford community, the Medicine X organizers are pleased to extend discounted rates of up to 72% off our current prices.

- \$699 to attend Medicine X and the Self-Tracking Forum Sept 28-30, 2012 (Normally \$2448, a 72% savings)
- Regular staff members may be eligible to use STAP funds to cover the full cost of the conference with supervisor approval. Refer to the [STAP website](#) for further details.

To register today, visit: <http://medicinex.stanford.edu/stanford-university-access-program>. Please [click here](#) to access the special \$699.00 rate to attend Medicine X Sept 29-30, 2012.

Some Notable Events

- The Stanford Cancer Institute hosted the ***Sixth Comprehensive Cancer Research Training Program*** from September 17-21st. Special thanks to Drs. Amato Giaccia, Ginna Laport, James Ford and Karl Blume for their leadership with this excellent program.
- ***The Stanford University Postdoctoral Association*** held its 2nd Annual Research Symposium on September 20th. The SUPD has done a great job in fostering a community of scholars, colleagues and friends at Stanford. Special thanks to Simal Ozen Irmak, Hedwich Kuipers, Gerwin Hassink, and Yoan Konto-Ghiorgi for their work in hosting and coordinating this important program.

Other Awards and Honors

- ***Dr. Jonathan S. Berek*** was named the first incumbent of the Laurie Kraus Lacob Professorship at a festive event on September 18th. This event honored the extraordinary compassion, commitment, dedication and generosity of Ms. Laurie Lacob, who made this professorship possible, along with the exceptional contributions of Dr. Berek as a world-renowned leader in gynecologic cancer. Dr.

Berek is also the Chair of the Department of Obstetrics and Gynecology and the Director of the Stanford Women's Cancer Center.

- **Dr. John R. Adler Jr.**, Professor of Neurosurgery and Radiation Oncology, has just received the Ralph Cloward Award from the Western Neurosurgical Society. Please join me in congratulating Dr. Berek and Dr. Adler.

Appointments and Promotions

- *Stephen Baccus* has been promoted to Associate Professor of Neurobiology, effective 8/01/2012
- *Valerie Baker* has been promoted to Associate Professor of Obstetrics and Gynecology, effective 9/01/2012
- *Victor Carrion* has been promoted to Professor of Psychiatry and Behavioral Sciences, effective 9/01/2012
- *Karl Deisseroth* has been promoted to Professor of Bioengineering and of Psychiatry and Behavioral Sciences effective 9/01/2012
- *Jason Dragoo* has been promoted to Associate Professor of Orthopaedic Surgery, effective 9/01/2012
- *Sharon Geaghan* has been reappointed to Professor of Pathology at the Stanford University Medical Center, effective 6/26/2012
- *Jeremy D. Goldhaber-Fiebert* has been reappointed to Assistant Professor of Medicine, effective 11/01/2012
- *Allison W. Kurian* has been reappointed to Assistant Professor of Medicine and of Health Research and Policy, effective 2/01/2013
- *Laura Lazzeroni* has been reappointed to Associate Professor (Research) of Psychiatry and Behavioral Sciences, effective 10/01/2014
- *Henry Lowe* has been appointed to Associate Professor of Pediatrics, effective 9/01/2012
- *Peter G. Maxim* has been reappointed to Assistant Professor of Radiation Oncology, effective 9/01/2012
- *David Miklos* has been appointed to Assistant Professor of Medicine, effective 9/01/2012
- *Walter Park* has been appointed to Assistant Professor of Medicine, effective 9/01/2012

- *Kathleen L. Poston* has been reappointed to Assistant Professor of Neurology and Neurological Science, effective 2/01/2013
- *Edward Riley* has been promoted to Professor of Anesthesia, effective 8/01/2012
- *Daniel L. Rubin* has been reappointed to Professor of Radiology and of Medicine, effective 2/01/2013
- *John Sunwoo* has been reappointed to Assistant Professor of Otolaryngology-Head and Neck Surgery, effective 10/01/2012
- *Jeffrey Yao* has been promoted to Associate Professor of Orthopaedic Surgery, effective 9/01/2012

Dean's Newsletter

October 15, 2012

Celebrating Science and Discovery

The announcement on October 10th that Brian Kobilka is the winner of the 2012 Nobel Prize in Chemistry (see: <http://med.stanford.edu/ism/2012/october/nobel-kobilka.html>) was an extraordinary affirmation of the value of science and discovery. Dr. Kobilka's life and work are tributes to scientific elegance, excellence and endurance, conducted over decades with passion, dedication and commitment. He wins this extraordinary prize with Bob Lefkowitz of Duke University, who was his mentor earlier in his career and who helped shape and launch his career in science. Trained as an MD, Brian became dedicated to solving deep and important scientific mysteries. When others felt the problem he was focusing on was impossible to solve, he devoted his energies to doing just that. Over the past decades he pursued with exquisite detail an understanding of the adrenergic receptor and succeeded in defining its 3-dimensional structure along with its function and physiological relevance. His work stands at the crossroads of chemistry, structural biology, and molecular medicine and has been greatly enhanced by the scientific environment of Stanford University, which bridges these and other disciplines.

Brian's commitment to staying focused on a problem of extraordinary complexity and to finding the techniques and technologies that answer both structural and functional questions is also a testament to the value of investigator initiated basic science research. In a day when big teams and massive labs have become the common mediator of modern science, Brian Kobilka stands as a model -- a small group of committed scientists who can illuminate deep mysteries and open doors to new solutions that will ultimately improve human life. His work is a powerful demonstration of the importance of supporting basic science research - whose payoff can take many years or decades to reach fruition but, when it does, changes the direction of medicine and science. And beyond all this, Brian Kobilka is one of the most humble, caring and generous people we are

privileged to know and value in our community at Stanford, where he serves as the Helene Irwin Fagan Professor and Chair of the Department of Molecular and Cellular Physiology in the School of Medicine.

It is also notable that a week prior to this year's Nobel announcements, we held a Partners in Medicine Event in the Paul and Millie Berg Hall that featured interviews with the then three current Nobel Laureates: Dr. Paul Berg, winner of the 1980 Nobel Prize in Chemistry; Dr. Roger Kornberg, winner of the 2006 Nobel Prize in Chemistry; and Dr. Andy Fire, winner of the 2006 Nobel Prize in Medicine or Physiology. Dr. Kobilka was one of the more than two dozen faculty in attendance at the dinner that preceded the "Conversations with Nobel Laureates." Along with his colleagues, Dr. Kobilka was helping to educate and inform the nearly 300 attendees of this event about the importance and relevance of basic science in leading to fundamental insights about the world in which we live, and also how basic science establishes the foundations for discoveries that can transform medicine and human health.

As noted above, many of dividends of basic research take years to decades before their impact is truly understood or applicable to the diagnosis and treatment of disease. Investment in basic science is what has made the USA the world leader in discovery and innovation. But, as I have written on numerous occasions, these investments are now threatened by our nation's economy and the priorities being set by our government, including the funding priorities set by the National Institutes of Health. Increasingly over the past decade (and with the exception of the years of stimulus funding from the American Recovery and Reinvestment Act), support for funding of research from the NIH and other agencies has become more limited and even more competitive, with less purchasing power and with an increasing shift to "big science" and more applied research than to investigator initiated basic research – such as that carried out by Brian Kobilka and many of our other outstanding basic science faculty at Stanford. We have witnessed science becoming more politicized and sometimes being accompanied with an anti-science bias, whether in climate research, stem cell biology or evolutionary biology. These are worrisome trends and could result in America losing its global preeminence in science and engineering.

While it is exciting and exhilarating to celebrate "Nobel moments," less appreciated is how challenging the work and life of an academic scientist can be. This is particularly the case in medical schools, where most of the support for research and a not insignificant proportion of personal compensation come from success in grant funding. It is true that at Stanford medical school faculty have the highest amount of competitive NIH funding per individual of any other medical school in the nation. This speaks to the extraordinary talents and tenacity of our faculty – as well as to the time and effort spent in writing grants and pursuing various funding opportunities. But it does not address the pressures and toll on faculty of continuously writing grants to sustain research funding. This is very much the story for Dr. Kobilka, who has spent enormous portions of his time and energy submitting grants and seeking new sources to support his work and that of his students, trainees and colleagues, sometimes with success but also with failure and disappointment.

This is the hard backstory of the celebratory news of discovery and success and the recognition that comes from major awards and honors.

While most of our faculty will continue to say how fortunate they are to be part of a community of excellence like that at Stanford, most would also acknowledge the pressures and worries about whether grants will be funded and whether they can pursue ideas and research directions that matter. This is enormously stressful – and is becoming even more so. Even great scientists, including Nobel Laureates, are not immune to these challenges, which are getting worse rather than better. This is, in part, why we held the Partners in Medicine event on October 2nd.

At universities like Stanford, philanthropic support from our community, both locally and globally, has been transformative. This extraordinary support has enabled us to build world-class laboratories and education facilities. The recently launched Campaign for Stanford Medicine will play a major role in the construction of the new Stanford Hospital, just as the Children's Health Initiative and the "Breaking New Ground" campaign have helped with the plans and construction for the Lucile Packard Children's Hospital. Support from grateful patients, alumni and wonderful community members has created financial aid funding for our students and has been a source for seed grants for innovative research, including for our Stanford Institutes of Medicine.

The Campaign for Stanford Medicine is just getting underway and will be led by our next Dean, Dr. Lloyd Minor, in collaboration with Amir Rubin, CEO at Stanford Hospital & Clinics, along with faculty and hospital leaders and the tremendous support from community volunteers and the Office of Medical Center Development. However, it is clear already that making the case for support for basic science research and graduate education is of essential importance. Of course no one envisions that philanthropic support can or should supplant or replace the competitive funding that comes from agencies like the NIH. That is not an attainable or even a meritorious goal. But when philanthropic support can be garnered to create Faculty Scholar Awards, Professorships, Graduate Student Education and Innovation Funds (among other needs) it can make a world of difference in the ability of our faculty to be successful – and innovative – and make transformative discoveries.

Many times we hear that raising philanthropic funds for basic research is too difficult or not feasible, because the connections between basic research and the drugs or treatments that impact human life and disease are too distantly separated in time. However, I would venture that, while those of us in science and medicine understand this dilemma, we have personal examples of how these connections are actually quite closely defined and how they have impacted our careers or the patients we have cared for. I can think of many examples in my own career, but one that stands out for me occurred at the beginning of the HIV/AIDS epidemic in the US. I was a pediatric oncologist and infectious disease specialist doing laboratory and clinical research in the Clinical Center at the National Institutes of Health when the first cases of HIV/AIDS occurred in adults and then children.

Initially the cause of what became known as AIDS was unknown and approaches to diagnosis and treatment were lacking. But advances in diagnosis and treatment were able to advance relatively rapidly and to a large measure because of discoveries and technologies that had been made years to decades earlier, some of which took place at Stanford. These included the Fluorescent Activated Cell Sorter (FACS) invented by Len and Lee Herzenberg and the discoveries of retroviruses and the enzyme reverse transcriptase. Of course, these basic science discoveries also happened because of other fundamental scientific insights that emerged from different disciplines, often driven by the curiosity of the investigator and not because of an anticipated impact on a human illness. Indeed none the examples I mentioned above anticipated the eventuality of HIV infection – but they each played a central role in the early diagnosis of HIV infection, the ability to make blood transfusions safe (which came from the work of Dr. Ed Engelman at Stanford) or in the first antiretroviral agents that blocked reverse transcriptase and that I was able to use in the children I was caring for at the NIH.

Simply put, if basic research hadn't been done years or decades previously in seemingly unconnected fields and disciplines, the opportunity to make progress against a new disease like HIV/AIDS would have been almost unthinkable. Similar stories can be told about many other basic science discoveries that ultimately had a big impact on medicine but which were not known or anticipated when they were first being conducted. This is the value and payoff of investments in basic research.

We are fortunate at Stanford to have outstanding basic and clinical science faculty who work collaboratively and who engage with amazing students and trainees. We have an environment that fosters innovation and discovery across disciplines and that has created an intricate ecosystem of excellence. It is a system that has facilitated extraordinary discoveries, including those made by Brian Kobilka and by others that helped his journey that culminated in the Nobel Prize. But we are at a point in history when we cannot expect this work to go on unless there is commitment from our government and community to invest in and support research broadly – including in the biomedical sciences. It is also a point in history when we need to be advocates for research and when our community can make an exceptional difference in supporting innovation and our pipeline to the future that includes our students and trainees. This is how we create the future – the fruits of which may not be known for years to decades from now, but which ultimately can be tracked back to fundamental discoveries resulting from probing minds and creative inquiries. That is an investment worth making and is the case for supporting basic science research at Stanford and beyond.

Welcome to the 2012 Stanford PhD Students

On Monday evening, September 24th, a newly designed graduate student Orientation and Welcome Dinner was held in Berg Hall of the Li Ka Shing Center for Learning and Knowledge (LKSC). Dr. Dan Herschlag, the Senior Associate Dean for Graduate Education and Postdoctoral Affairs, fostered discussions about issues highly relevant to new PhD students. Among the topics were: the transition from undergraduate to graduate school; choosing rotations and a thesis lab; and how to succeed in graduate school. These

topics were discussed by incoming PhD students together with current students and faculty and thus permitted a nice introduction to Stanford and the challenges and opportunities in graduate education. In addition, Dr. Adam de la Zerda, a newly appointed Assistant Professor in the Department of Structural Biology, spoke engagingly about his life as a graduate student – a perspective that is helpful to those just beginning their journey.

We are pleased to welcome the 135 incoming Bioscience and Interdisciplinary PhD students and 36 new Masters students, who began classes on September 24th. As with the MD students we welcomed in late August (see: http://deansnewsletter.stanford.edu/archive/08_27_12.html), the incoming PhD class is diverse, and the entering students have exceptional academic and personal credentials and accomplishments. Our 97 Biosciences PhD students were selected from a pool of 1820 applicants submitting a total of 4182 applications (applicants can apply separately to one or more departments or programs). This was an increase of almost 14% from last year. Women comprise 52% of the 2012 entering class, and 8.2% of the incoming PhD students are underrepresented minorities. Reflecting our global community, 20% of the students are international and were born in 19 different countries. Those born in the US come from 22 different states. Our new PhD students come from 60 different undergraduate schools, with four or more coming from each of the following: MIT (7), UC Berkeley (5), Brown (4), University of Washington (4), and Yale (4). Of note, 15 of these students already have advanced degrees: one Master of Technology, three MA degrees, 11 MS degrees (one student has two of these), and one has an MD.

The home programs of the Biosciences are housed primarily in the School of Medicine, but they also include the Humanities and Sciences Programs in Biology and Biophysics. In addition to the Biosciences programs, the new Stem Cell PhD program (see: <http://med.stanford.edu/ism/2011/april/stem-phd.html> and <http://stemcell.stanford.edu/education/phd/index.html>) matriculated 15 new students, and Bioengineering, a joint program of the schools of Medicine and Engineering (see: <http://bioengineering.stanford.edu/>), matriculated 23 new PhD candidates. The number of incoming students in a program/department ranges from "large" in the case of Biology (with 24 students) to small (with one student in Structural Biology). The 36 Masters students joining us are matriculating in Bioengineering, Epidemiology, Genetic Counseling, Biomedical Informatics, Masters in Medicine, and Health Services Research.

Also of note, the third annual White Lab Coat Ceremony will be held on October 19th in Berg Hall. This celebration parallels the Stethoscope Ceremony for MD students as a welcoming tradition in the School of Medicine. Stanford Medical School is unique in having nearly equal numbers of MD and PhD students (with lots of dual degree students), which is something worth celebrating in its own right. Our outstanding PhD students play an incredibly important role in contributing to the rich and creative scientific environment that defines Stanford.

Special thanks go to the staff who organized and brought the Orientation and Welcome Dinner to life: Sarina Tom, John Bray, Lorena Najarro, Dominique Kalata, Mary Boyer,

Samar Fahmy, and Zera Murphy and to Julia Tussing, Associate Dean for Education Programs and Services.

Having shared the names of the new MD students in my August 27th Newsletter I am also most pleased to share the new PhD students and their home program. Please note that these are only the PhD students entering the current Bioscience Program and the list does not include the new students in Stem Cell Biology and Regenerative Medicine or the new PhD students in Bioengineering. It is also important to point out that two of the major home departments (Biology and Biophysics) are officially housed in the School of Humanities and Sciences. It is terrific that we are able to have PhD programs that cut across schools and disciplines.

Welcome to all!

Will November 6th Impact the Cost of Care in the US?

With the presidential election just weeks away, it is not a surprise that there is considerable interest and concern about how the results of the election will impact health care costs and the Affordable Care Act. While the topic of healthcare costs are certainly on the minds of voters, the discussions and debate between candidates and constituencies has seemed more rhetorical than illuminating. While the details of the Affordable Care Act are known, there is still confusion and debate about how its various components will unfold and, most importantly, how the ACA will impact health care costs into the future. This is a topic I have covered in a number of past newsletters (see: http://deansnewsletter.stanford.edu/archive/07_02_12.html, http://deansnewsletter.stanford.edu/archive/03_07_11.html, http://deansnewsletter.stanford.edu/archive/09_27_10.html#4

Recognizing that the details of the healthcare plan that would unfold under a Romney presidency are less well defined, the Commonwealth Fund recently reported an analysis entitled “*Health Care in the 2012 Presidential Election: How the Obama and Romney Plans Stack Up*” (see: <http://www.commonwealthfund.org/Publications/Fund-Reports/2012/Oct/Health-Care-in-the-2012-Presidential-Election.aspx>). The analysis and report question whether the respective candidates’ plans will increase the number of Americans who have health insurance, whether their stated or assumed plans will make health insurance more affordable and whether they will protect consumers, whether the plans will improve choice, and help small businesses and whether they will address some of the major challenges with entitlement programs like Medicare. The bottom line question is whether it can be determined which of the candidates’ plans will slow healthcare costs and improve the quality of the healthcare that is delivered.

Needless to say the answers to such questions are of enormous importance, but it is certainly safe to say that the conclusions drawn from the Commonwealth Fund report – or others – will be broadly contested and debated. That said, the Commonwealth Fund study concluded that “*On each of the seven criteria used in this analysis to evaluate the candidates’ health care platforms, President Obama’s plan to fully implement the Affordable Care Act would likely outperform Governor Romney’s plan to repeal the law and replace it with fewer federal requirements for insurance markets and reduced funding for the Medicaid and Medicare programs. This conclusion is driven in part by the considerable detail available in the health reform law and the new guidance and regulations issued by the Department of Health and Human Services to implement its provisions, compared with Romney’s far less detailed proposal to replace the law.*”

Of course details are important and we cannot dismiss that those that would unfold from a Romney plan would have a greater impact on the healthcare system and healthcare reform. Hopefully we will learn more of the details between now and November 6th. But there can be no question that the results of the election will impact healthcare in the US for the future. Regardless of the politics, we need to continue to advocate and support changes that improve the quality, service and costs of medical care – and at the same time, foster innovation and discovery to improve health and the delivery of healthcare. Based on the many programs put into place over the years, Stanford has the opportunity to lead in all of these areas, which would be great for our communities, locally and globally.

Massachusetts Voters Will Consider the Death with Dignity Act on November 6th.

Having come to Stanford from Massachusetts I well recall the feeling of being a member of a Commonwealth that was unique, sometimes singularly so. Although now ancient history, I recall having a bumper sticker on my car saying, “Don’t Blame Us – We are from Massachusetts” following the 1972 presidential election (can that really be 40 years ago!). And as we move to the upcoming election, it is of some interest that Massachusetts has been the testing ground for healthcare reform that one candidate offers as a model for the nation and the other seems to want to deny – or at least limit it to Massachusetts. While it won’t be the first state to do so (Oregon did so in 1990 and Washington in

2009), citizens of Massachusetts will vote on a ballot initiative called the “**Death with Dignity Act**” so that “*an adult Massachusetts resident who has the capacity to make health care decisions and who has been determined by his or her attending and consulting physician to be suffering from a terminal disease that will cause death within six months may obtain medication that the patient may self administer to end his or her life in a humane and dignified manner. It is further declared that the public welfare requires that such a process be entirely voluntary on the part of all participants, including the patient, his or her physicians, and any other health care provider or facility providing services or care to the patient.*”

The Death with Dignity Act is distinctly different from euthanasia or direct physician assisted death, such as is practiced in the Netherlands, Belgium and several other nations (see: “End-of-Life Practices in the Netherlands under the Euthanasia Act that was published in the New England Journal of Medicine in 2007 - <http://www.nejm.org/doi/full/10.1056/NEJMsa071143>). Julian Prokopetz and Lisa Soleymani Lehmann discussed this issue in an article entitled “*Redefining Physicians’ Role in Assisted Dying*” in the July 12, 2012 NEJM (see: <http://www.nejm.org/doi/full/10.1056/NEJMp1205283>). Of course there are strong views on all sides of this issue, one of which is provided by Marcia Angell, former Editor in Chief of the New England Journal of Medicine, in the October 11th issue of the New York Review of Books entitled “*May Doctors Help You to Die*” (see: <http://www.nybooks.com/articles/archives/2012/oct/11/may-doctors-help-you-die/>). As a physician and someone who has cared for many dying children with cancer and AIDS, I have opinions about these issues, but that is not the point of mentioning the ballot initiative in this newsletter. Simply it is to highlight that states are coming forward with initiatives to address the process of death and dying and importantly, this is a matter we should all understand better and about which we should form our own opinions.. But at least a dialogue is underway – even if still nascent.

Opening of the Stanford Women’s Cancer Center

On Thursday, September 27th we celebrated the official opening of the Stanford Women’s Cancer Center. This new Center, led and championed by Dr. Jonathan Berek, the Laurie Kraus Labov Professor and Chair of the Department of Obstetrics and Gynecology, was made possible through the dedicated efforts and commitments from Under One Umbrella. In addition to the incredible gifts from Laurie Labov and Jill and John Freidenrich, Under One Umbrella, representing a group of community leaders and volunteers, has worked tirelessly since 2009 to bring the Women’s Cancer Center to reality. Special thanks go to the Under One Umbrella leaders, including Deborah Berek, Fan Codisoti, Jill Freidenrich, Lanie Garrick, Jillian Manus, Lisa Schatz and Diane Taube. Numerous other members of the community have contributed their time, dedication and resources – for which we are enormously grateful. We also want to thank the partnership, support and contributions from the leadership of Stanford Hospital & Clinics (SHC), particularly Amir Rubin, President and CEO of SHC, and the wonderful support from Sridhar Seshadri, Vice President, Clinical Cancer Center and Cardiovascular Health.

The Women's Cancer Center provides a caring home facility for women facing the serious challenges of breast and gynecologic cancer. It also serves as important symbol to the community that Stanford Medicine cares deeply about the care of women.

Thanking CJ Huang and Family

On Thursday, October 4th we had the opportunity to thank CJ Huang and his family for the extraordinary gifts and support they have provided to Stanford over many years. Because of this support Stanford was able to launch the Asian Liver Center in the 1990s that has been so ably led by Dr. Sam So, the Lui Hac Minh Professor in the Department of Surgery. In November 2010, the Haungs pledged funding that will enable the construction of the CJ Huang Center that will be located at 780 Welch Road. Construction of this new facility, which will house the Asian Liver Center and other programs related to clinical and translational research, will begin in several months. We are deeply grateful to CJ Huang and his family and were so pleased to honor and celebrate his incredible contributions to Stanford.

Dean's Medal Celebration

On Saturday evening, October 13th, we had the wonderful opportunity to award and celebrate the 2012 winners of the Stanford University School of Medicine Dean's Medal. This is the highest honor that the medical school bestows and it was truly an honor to recognize the extraordinary contributions of this years Dean's Medal Awardees (see: <http://med.stanford.edu/ism/2012/october/medal-1008.html>).

The recipients of the 2012 Dean's Medal offer new depth to our understanding of how science shapes humanity and why Stanford Medicine unites medicine with compassion and communities, locally and globally.

The work of **Dr. Lucy Shapiro**, the Virginia and DK Ludwig Professor, Department of Developmental Biology, exemplifies an artist's exploration of life – how its basic elements are formed and assembled, how they interconnect, take shape and function in multiple domains and dimensions. Her work is a testament to the beauty of basic science and how discovery can lead to insights in the human condition.

The many contributions of **Dr. Sarah Donaldson**, the Catharine and Howard Avery Professor, show how fundamental physical energies can change the lives of children with cancer through discovery and compassion that has been extended to communities worldwide.

The Baxter Foundation has not only provided seminal funding for innovative research at Stanford, but has also provided the human presence of its Trustees, who have become a beacon of hope and opportunity for students and faculty for more than five decades.

Anna Deveare Smith is an artist and playwright (and former Stanford faculty member) who has connected the lives of individuals from different walks of life to give new voice and meaning to some of society's and medicine's most pressing dilemmas –by connecting sobering facts with compassion, humanity and deep insight.

While each of our 2012 Dean's Medal winners has had different and discrete life journeys, they share in common a passion and commitment to science, medicine, compassion and humanism – and to making the world a better place. Please join me in congratulating this year's recipients of the 2012 Dean's Medal.

Upcoming Events

Oral Cancer Screening at Stanford - FREE

Saturday, October 20

8 a.m. - 12 p.m.

Stanford's Adult ENT Clinic, 1st floor
801 Welch Road, Palo Alto

If you use alcohol or tobacco or lack dental care, you may be at risk for oral cancer. Come to our Oral Cancer Screening Clinic to be examined by Stanford doctors and learn more about oral cancer prevention and detection. Screening is quick and painless, and resources for tobacco cessation and low-cost dental care will be available.

For more information, call (650) 427-9777 or email oralcancer@stanford.edu.

Seminar – iPS Technology and its Potentials for Future Medicine

Tuesday, October 23

10 a.m. – 11 a.m.

Clark Center Auditorium

You are invited to hear Hiromitsu Nakauchi, MD, PhD, Director of the Centre for Stem Cell Biology and Regenerative Medicine at the University of Tokyo, speak about how iPS technologies will affect medicine in the future.

Four School of Medicine Faculty Are Elected to the Institute of Medicine (IOM)

On October 15th, the Institute of Medicine announced the 70 individuals who have been elected to the 2012 class. Election to the IOM of the National Academy of Sciences “is considered one of the highest honors in the fields of health and medicine and recognizes individuals who have demonstrated outstanding professional achievement and commitment to service”. This year's newly elected Stanford faculty IOM members are:

- ***Dr. Lloyd Minor***, Dean Designate, Stanford University School of Medicine
- ***Dr. Stephen Quake***, Investigator, Howard Hughes Medical Institute; and Lee Otterson Professor and professor of bioengineering and applied physics, department of applied physics
- ***Dr. David Spiegel***, Jack, Samuel and Lulu Willson Professor and Associate Chair, Department of Psychiatry

- **Dr. David Stevenson**, Dean and Senior Associate Dean for Academic Affairs, and the Harold K. Faber Professor of Pediatrics and Professor, by courtesy, of Obstetrics and Gynecology

Honors and Awards

- **Dr. Russ Altman**, Professor of Bioengineering, Medicine and Genetics, has been appointed to two major national leadership positions. He is now President-Elect of the American Society for Clinical Pharmacology and Therapeutics and will assume the role of President of ASCPT beginning in March 2013. Dr. Altman was also appointed Chair of the Science Board to the US Food and Drug Administration. In addition, Dr. Altman has just been appointed as the first Kenneth Fong Professor in the School of Engineering. The professorship carries with it a preference for faculty whose academic focus is at the intersection of engineering and medicine. Congratulations to Dr. Altman!
- **Dr. Ellen Yeh**, Acting Assistant Professor in Pathology, has been selected for a 2012 Career Award for Medical Scientists (CAMS) by the Burroughs Wellcome Fund (BWF). She is one of ten recipients chosen from 124 applicants from top research universities to receive this very competitive award, which honors her personal accomplishment and the scholarly environment at Stanford. Congratulations, Dr. Yeh.

Appointments and Promotions

Todd F. Atwood has been promoted to Clinical Assistant Professor of Radiation Oncology, effective 10/1/2012

James T. Badger has been reappointed to Clinical Assistant Professor of Surgery, effective 10/1/2012

Dipanjan Banerjee has been promoted to Clinical Assistant Professor of Medicine, effective 10/1/2012

Joy Brown has been promoted to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 10/1/2012

David R. Chen has been appointed to Clinical Assistant Professor (Affiliated) of Neurology & Neurological Sciences, effective 8/1/2012

S. Charles Cho has been promoted to Clinical Professor of Neurology & Neurological Sciences, and by courtesy Neurosurgery, effective 12/1/2012

Cheryl Cho-Phan has been reappointed to Clinical Assistant Professor of Medicine, effective 9/1/2012

Theodore Chu has been promoted to Adjunct Clinical Assistant Professor of Otolaryngology-Head and Neck Surgery, effective February 1, 2013

Todd Dray has been promoted to Clinical Associate Professor (Affiliated) of Otolaryngology – Head & Neck Surgery, effective 10/1/2012

Jeffrey C. Faig has been promoted to Clinical Professor of Obstetrics and Gynecology, effective 1/1/2013

Jennifer Kaci Fairchild has been promoted to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 10/1/2012

Jonathan D. Feldman has been promoted to Clinical Professor (Affiliated) of Pediatrics, effective 11/1/2012

Anthony L. Filly has been appointed as Adjunct Clinical Assistant Professor of Radiology, effective October 1, 2012

Jennifer D. Frankovich has been promoted to Clinical Assistant Professor of Pediatrics, effective 10/1/2012

Carlos Greaves has been reappointed to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 9/1/2012

Alan Greene has been appointed as Adjunct Clinical Professor of Pediatrics, effective September 1, 2012

Meghan N. Imrie has been reappointed to Clinical Assistant Professor of Orthopaedic Surgery, effective 9/1/2012

Aarif Y. Khakoo has been appointed as Adjunct Clinical Associate Professor of Medicine, effective November 1, 2012

Elizabeth Koehler has been promoted to Clinical Assistant Professor of Medicine, effective 11/1/2012

Amy Kunihiro has been promoted to Clinical Assistant Professor of Surgery, effective 10/1/2012

Truc M. Le has been promoted to Clinical Assistant Professor of Pediatrics, effective 10/1/2012

Charles Lin has been appointed to Clinical Assistant Professor of Ophthalmology,

effective 10/1/2012

Peter T. Lin has been appointed to Clinical Assistant Professor (Affiliated) of Neurology & Neurological Sciences, effective 8/1/2012

Amardeep K. Mann has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 6/1/2012

Ann L. Marqueling has been appointed to Clinical Assistant Professor of Dermatology and of Pediatrics, effective 10/1/2012

Halan Matles has been promoted to Adjunct Clinical Assistant Professor of Medicine, effective November 1, 2012

Martha J. Morrell has been reappointed to Clinical Professor of Neurology & Neurological Sciences, and by courtesy Neurosurgery, effective 2/1/2013

Hemalatha Narra has been appointed to Clinical Assistant Professor (Affiliated) of Neurology & Neurological Sciences, effective 8/1/2012

Periklis Panousis has been reappointed to Clinical Assistant Professor of Anesthesia, effective 4/1/2013

Ravi Prasad has been promoted to Clinical Associate Professor of Anesthesia, effective 10/1/2012

Nilima Ragavan has been promoted to Clinical Associate Professor of Pediatrics, effective 11/1/2012

Arun Rangaswami has been reappointed to Clinical Associate Professor of Pediatrics, effective 2/1/2012

Ella Reznik has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 11/1/2012

Katherine Sanborn has been reappointed to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 10/1/2012

Kimberly Genise Shepard has been reappointed to Clinical Assistant Professor (Affiliated) of Otolaryngology – Head & Neck Surgery, effective 10/1/2012

Eva Van Leer has been appointed to Clinical Assistant Professor of Otolaryngology – Head & Neck Surgery, effective 10/1/2012

Brian Yim Young has been appointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 6/1/2012

The Dean's Newsletter: November 5, 2012

This is My Penultimate Newsletter

Following this more traditional Dean's Newsletter I will have one more to share a bit later in November. Beginning on my first official day at Stanford (April 2, 2001), I have tried to keep you abreast of various actions, undertakings, issues and challenges that have affected Stanford Medicine and beyond. Admittedly we have shared a lot of words together - in fact, over 3,000 pages worth according to David Haray, Vice President, Patient and Financial Services at Stanford Hospital & Clinics, who has tabulated the bits of information in the Newsletters over the past nearly 12 years.

I deeply believe that keeping our broad and diverse community aware and informed about the issues transpiring at Stanford Medicine is important as a way to building a sense of engagement and involvement in each of interrelated missions, goals and objectives. With that in mind, within the next weeks I will have shared 264 issues of the Dean's Newsletter with you (about 22 issues per year) that have chronicled day-to-day events impacting our community, important issues in medicine, science, education, health care as I saw them, and many other relevant issues. I made the decision to compose these issues myself (including typing them) but to benefit from very helpful format and style checks by Kathy Gillam, Senior Advisor to the Dean. I thank Kathy for that heroic work, which she has often done on Sunday evenings with the assistance of one or more lattes - depending on the size and scope of the DNL.

I also made the decision to "push" the newsletters to you broadly - students, trainees, faculty, staff and others - in the belief that you had the choice of reading them or not. However, because all the Newsletters are also archived and easily accessible (see: <http://deansnewsletter.stanford.edu/archive/>), they have offered me - and others - the opportunity to check issues, facts and events that occurred weeks - or years ago - and review them in a reasonably objective fashion. That said, I readily acknowledge that the Dean's Newsletters are unabashedly written in my own voice (not infrequently in the first person) and reflect my biases, beliefs and positions - something I also felt I wished to share with you. Needless to say, some of those beliefs, positions and decisions have been sustained and others not. Some positions were widely agreed to - and others not. But that is part of the leadership journey as well and is also how life unfolds - for individuals and institutions.

I have also received considerable feedback from readers of the DNL over the years - including individuals who are not even at Stanford. There is no denying that preparing these Newsletters has taken a lot of my personal time - often done on Saturdays, during travel or in other spare moments. Of course if I totaled up the number of hours I have spent composing and writing the Newsletters (at least 1,500 hours) that could be seen as an astounding number. Some might say it was a waste of my time - but I have viewed it as

one of my priorities and privileges, the opportunity to engage you in conversations on the developments, issues and the very evolution of Stanford Medicine. This will be the last DNL in the format of its 262 predecessors, and while I must admit that not having to build in time to compose and write future issues also brings a sense of relief and personal closure, it has been an honor and privilege to have shared more than 1.2 million words with you - and to share our individual and collective journey through this chapter in Stanford Medicine.

The Issue of Information Technology Security, Privacy and Personal Health Information

Since the initial passage of the Health Insurance Portability and Accountability Act of 1996 (HIPPA), data security and patient privacy have become major sources of concern and risk for individuals and institutions. These risks have increased with greater access to patient information (including through the Electronic Medical Record) and, increasingly, because of the risk of Protected Health Information (PHI) or other Restricted or Prohibited Data being stored on individual computers - which have increasingly shifted to laptops and other mobile devices. We now live in a world in which all of us (especially at institutions like Stanford) have multiple devices (computers, smartphones, tablets, memory sticks, etc.) for information storage. Most of the devices we use at work have been purchased through Stanford - but many individuals have personal devices, including those they have purchased themselves, which are also used to store information and communicate with colleagues at Stanford and well beyond. Given the complexity of these issues, Stanford University has clear policies on Health Information Privacy and Security (see: <http://hipaa.stanford.edu/policy.html>).

There are, of course a range of risks, the most stringent of which relate to breaches of patient privacy. Such breaches can occur within an institution and medical center by unauthorized access to patient information or by loss of a device (computer, mobile device or other) that potentially has PHI or Restricted or Prohibited Data on it. Unless those devices have been protected by encryption, when loss or theft occurs of a device that potentially contains PHI or Restricted Data, the episode is reportable, carries potentially significant fines and enormous individual and institutional risk - both reputational, financial, legal and operational. As you likely know, there have been some major infractions of HIPPA security at many major institutions - to which Stanford is not immune.

These privacy breaches violate a fundamental trust of our patients and research subjects, and the risk to their privacy and to their trust is a major concern, and one that raises this protection of such information to a higher level.

Managing information security is an enormous challenge, given the great number of devices that now exist - likely more than 10,000 in the School of Medicine alone. The School of Medicine, Stanford University Medical Center and Stanford University have been grappling with these issues and risks, which are heightened whenever a device is lost or stolen and especially if that device potentially contains PHI or Restricted Data and the device has not been secured or encrypted.

Over the past several weeks the School of Medicine Office of Information Resources and Technology in conjunction with Stanford University's Office of the General Counsel have been exploring better ways of protecting PHI and Restricted Data in a reliable and safe way - one protects patients, faculty, data and the institution. This is a topic about which I have communicated frequently - but which has gained considerable attention in the last weeks. The results of these discussions are a work in progress and have benefited from input from faculty as well as input and reactions from institutional leaders across the Medical Center and University. While they will evolve further over the next months based on input from both research and clinical faculty, a reasoned rendition of where we are as of November 5, 2012 follows:

The School of Medicine Data Security Policy **mandates** enterprise backup and encryption of all computers and mobile devices used for Stanford business by faculty, staff, residents, fellows and students, **if the device might store or access Protected Health Information (PHI) or other Restricted or Prohibited Data**. This requirement applies to both Stanford-owned and personally owned equipment.

The School also **strongly encourages** and supports backup and encryption of all computers, tablets, smartphones and storage devices used to support our community's work at Stanford even if the devices do not store or access Restricted Data, including PHI. This is not however mandatory.

All faculty, staff, students, residents and fellows are required to complete an attestation process declaring their access to PHI and other Restricted or Prohibited Data and attesting that their computers and mobile devices are compliant with this policy.

Mobile Device Management technology (MDM) automatically enables encryption and strong password protection on mobile devices as well as supporting the ability to remotely erase a device if it is lost or stolen. Given the particular risk of loss or theft of smartphones and tablet computers, and the requirement to investigate each loss when the device is not encrypted, **the School of Medicine requires that MDM be installed on all Stanford-owned and personally owned devices for which we have a satisfactory MDM solution**. Currently the School and University provide MDM for iPhones and iPads and hope to have effective MDM solutions for other mobile platforms in the coming months. Mobile devices, such as smartphones and tablets, that might store or access Protected Health Information (PHI) or other restricted data, must have MDM installed. If MDM is not available for a device it must not be used to store or access Protected Health Information (PHI) or other restricted data. Policies will be applied to all mobile devices when appropriate MDM solutions are finalized.

Additional background information, guidelines and fact checks can be found on the IRT information website (see: <http://med.stanford.edu/datasecurity/>). Additional information about data security issues that are relevant to those doing international travel can be

found

at: <https://www.stanford.edu/group/security/securecomputing/stanfordonly/travel.html>

We fully recognize that the issues of data security, computer backup, encryption and related topics evoke many responses and reactions. At this juncture it should be clear that the School of Medicine policies require an attestation regarding whether one's computers or devices might contain PHI or Restricted Data. The process of gathering that information is underway and will be completed in early December. Those computers or devices that might contain PHI or Restricted Data will require backup and encryption. Policies related to computers that do not contain PHI and Restricted Data will be further formulated over the months ahead.

The Transformation of Health Care and the Workforce of the Future

It is hard to not be mindful, even if only briefly, that this issue of the Dean's Newsletter will be posted on the eve of the Presidential Election at a time when the future of health and healthcare have such importance and impact to our nation and the world. Beyond the rhetoric of the debates are the substantive matters of what will happen to the still nascent efforts in healthcare reform - and the impact that political and economic forces will have on the future healthcare in the US and beyond. At a superficial but still informative level, the healthcare plans of President Barack Obama and Governor Mitt Romney were shared in side-by-side Perspectives

(see: <http://www.nejm.org/doi/full/10.1056/NEJMp1211514> and <http://www.nejm.org/doi/full/10.1056/NEJMp1211516>) along with an analysis by Robert Blendon, John Benson and Amanda Brule about "*Understanding Health Care in the 2012 Election*" in the New England Journal of Medicine (see: October 25th issue <http://www.nejm.org/doi/full/10.1056/NEJMp1211516>).

While some of these issues will be past tense in a relative way following the November 6th election, the impact on the health profession, including education in the health professions and our entire healthcare environment, will unfold over the next decade and more. "Transforming Health Professions Education; Creating a Health Workforce for the 21st Century" was the theme of the Annual Meeting of the Institute of Medicine on October 15th, which I helped plan and chair. Given the length of training and the slow pace of change, it is clear that many of the forces that will guide healthcare even a decade from now are already unleashed. But to all it seems clear that medicine of the future will require new teams of providers who will need to work much more effectively across interdisciplinary boundaries, using technology as a medium for healthcare delivery but not losing sight of the social and value contract with patients and providers.

The shift of focus from disease to health has important implications for where care is delivered and who is responsible for delivering and coordinating it. The traditional hierarchical model of healthcare will change - but will be influenced by the increasing need to also provide care of the growing population of individuals with chronic disease, many of whom will be more elderly and urban dwelling. There seems little doubt that revised payment systems will guide some of these changes, with significant implications for physicians, hospitals and other providers. Indeed it is highly plausible that there will

be continued challenges to the "scope of care" and how much is provided by doctors, nurses, pharmacists, mental health care workers and others.

The obvious implications of these changes on professional education - its content, length and expectations, among other factors - will also unfold. At the same time, it is clear that if progress is to be made we cannot lose sight of innovation and discovery, basic and applied, and the opportunities to better utilize new technologies to add to the value proposition rather than just increasing costs. While there is no question about the power of biology in better defining the risk for disease, this must be coupled with the reality that the actual expression of illness has more to do with social, psychological and environmental forces than with risk *per se*. Preparing future generations of healthcare providers to more proactively address these challenges will be essential - and certainly a place where academic centers, including Stanford, will play an important role.

Clearly exciting times ahead, including the impact of the presidential election on November 6th!

Transition in Leadership and Farewell to Dr. Bobby Robbins

On Wednesday, October 31st, we had a celebration to honor Dr. Bobby Robbins, who leaves Stanford to begin his new role as the CEO of the Texas Medical Center on November 5th (see: <http://med.stanford.edu/ism/2012/september/robbins-0907.html>). Dr. Robbins has been an exceptional faculty member and leader at Stanford for more than two decades, and he has made an indelible mark on students, trainees, staff, faculty, colleagues and our community. At the ceremony honoring Dr. Robbins, important perspectives about Bobby's multifaceted contributions were shared by Dr. Bruce Reitz, Norman E Shumway Professor, Emeritus and Past Chair of the Department of Cardiothoracic Surgery; Dr. Alan Yeung, the Li Ka Shing Professor and Chief of the Division of Cardiology; Dr. Amir Rubin, President and CEO of Stanford Hospital & Clinics; Dr. Joe Wu, Associate Professor of Medicine and of Radiology and Member of the Stanford Cardiovascular Institute; and Dr. Lloyd Minor, who becomes Dean of the School of Medicine on December 1, 2012. They and many others offered their tributes, accolades and appreciation to Dr. Robbins.

I am also pleased to announce that Dr. Phil Oyer, the Roy B. Cohn-Theodore A. Falasco Professor of Cardiothoracic Surgery, has agreed to serve as the Interim Chair of the Department until Dr. Robbins' successor is found. We are grateful and appreciative for Dr. Oyer's important leadership during this time of transition. To that regard, on October 27th, Dr. Lloyd Minor charged the search committee to begin its important work on finding Dr. Robbins' successor as department chair.

Celebration of Art in the Li Ka Shing Center for Learning and Knowledge

Art lifts our spirits and brings meaning, reflection and dignity to our lives and environment. Since its opening, the Li Ka Shing Center for Learning and Knowledge has benefitted from art, much of it thanks to the wonderful gifts and dedication of Helen and Peter Bing. An additional and wonderful feature of the artwork in the LKSC has been the selections chosen by the School of Medicine Committee on Art. The first collection included paintings, sculpture and photography from School of Medicine faculty. On

October 30th, the Art Committee celebrated new art pieces that are housed on the first three floors of the LKSC and that represent the work of our broader School of Medicine Community. Among the wonderful new art pieces are the work of medical student Tessa Lohung, faculty member Dr. Al Spivack, staff member Roxanne Blackwood and Stanford Medicine family member Lea Feinstein. These wonderful new additions will remain on exhibition through April 2013. I invite you to take a tour of these new artistic expressions.

I also want to thank our School of Medicine Committee on Art that is chaired by Dr. Ralph Greco, Johnson and Johnson Professor of Surgery, along with Dr. Paul Berg, Robert W. and Vivian K. Cahill Professor of Cancer Research, Emeritus; Sabrina Buell (Consultant); Niraj Dangoria, Associate Dean, Facilities Planning and Management; Hilarie Faberman, Curator, Cantor Art Museum; Dr. Peter Koltai, Professor of Otolaryngology; Dr. Daria Mochly-Rosen, Senior Associate Dean for Research and Training in the School of Medicine and the George D. Smith Professor in Translational Medicine; Jon Pierucci, Senior Director of Development Operations; Maggie Saunders, Education Project/Program Planner; Traudi Sedelmayr, Conference Center Retail Services Manager; Dr. Audrey Shafer, Professor of Anesthesia at the Palo Alto Veterans Affairs Health Care System; Chris Shay, Facilities Engineer and Dr. Sakti Srivastava, Associate Professor (Teaching) of Surgery.

School of Humanities and Sciences Announces the Stanford Center for Computational, Evolutionary and Human Genomics

With the support of Dean Designate Dr. Lloyd Minor, Dean of Research Ann Arvin and the Provost and President, Richard Saller, the Dean of the School of Humanities and Sciences, has approved the creation of a new center called the Stanford Center for Computational, Evolutionary and Human Genomics. The Co-Directors of the new center are Dr. Marcus Feldman, the Burnet C. and Mildred Finley Wohlford Professor in the Department of Biology, and Dr. Carlos Bustamante, Professor of Genetics (in the School of Medicine) and, by courtesy, of Biology.

Celebration of Dr. Suzanne Pfeffer as the Emma Pfeiffer Merner Professor

On November 1st we celebrated the appointment of Dr. Susan Pfeffer as the new holder of the Emma Pfeiffer Merner Professorship in the Medical Sciences. The Merner Professorship is one of the oldest in the School of Medicine and was first held by Dr. Arthur Kornberg, founding Chair of the Department of Biochemistry at Stanford and Nobel Laureate in Medicine or Physiology. As the Merner Professor, Dr. Kornberg's contributions to medicine, science and Stanford have been nonpareil. When he became the Emma Pfeiffer Merner Professor Emeritus, the next incumbent of the Merner Professorship was Dr. Gary Glazer. Dr. Glazer's pioneering efforts provided the foundations for the department of Radiology at Stanford and for imaging sciences worldwide.

With the wonderful support from the Gustavus and Louise Pfeiffer Research Foundation we are now honored to have Dr. Suzanne Pfeffer as the third incumbent of this distinguished professorship. Dr. Pfeffer is an extraordinarily distinguished scientist, educator and leader, at Stanford and globally. She brings wonderful distinction to the

Merner Professorship and I hope you will join me in congratulating her for this new honor.

Celebration of the Professorship Honoring Dr. Harry Oberhelman and Mark Welton

On November 8th a celebration will be held to honor the announcement of the Harry A Oberhelman Professorship and the investiture of Dr. Mark Welton as its inaugural holder. The wonderful opportunity to honor Dr. Oberhelman, a much beloved surgeon and remarkable individual, by the creation of a professorship in his name has been made possible by a wonderful gift from Ed and Liliane Schneider, along with support from the Department of Surgery, thanks to the efforts of Dr. Tom Krummel, the Emile Holman Professor and Chair of Surgery. Dr. Oberhelman served on the Stanford faculty for more than five decades and his impact on the lives of patients, faculty and students has been extraordinary. It is also a great privilege to honor Dr. Mark Welton as the inaugural incumbent of the Oberhelman Professorship based on his exceptional contributions to surgery and academic leadership.

Please join me in congratulating Drs. Harry Oberhelman and Mark Welton.

Oral Cancer Screening Day

The Department of Otolaryngology held its first annual Stanford Oral Cancer Screening Day on October 20th at 801 Welch Rd with great success. Free oral cavity exams were provided by medical students, residents, faculty, and physician assistants. Over 120 underserved patients were screened throughout the morning, traveling from areas ranging from San Francisco, to the East Bay, to Santa Clara and San Mateo counties.

Approximately 10% had some finding that called for follow up, and one (almost certain) malignancy was discovered. This high prevalence of suspicious lesions speaks to how well announcements and advertising were delivered to the appropriate communities. The department intends to continue this fantastic program in the years to come.

Special thanks to faculty advisor Dr. John Sunwoo and department chair Dr. Robert Jackler for their enthusiasm and generous support. The event was organized by two third year medical students, Cristen Olds and Frank Chen. The event would not have been possible without the logistical support provided by Karen Pendley (assistant clinic manager), Asha Viswanathan (clinic manager), and Erika Shimahara (academic research and programs officer). Special thanks to otolaryngology residents Paula Borges and Gabriel Tsao, as well as Chafeek Tomeh (clinical instructor of the head and neck surgery program), Dr. Gary Roberts (Stanford dental program), and the Stanford Stop Smoking Program, all of whom volunteered their time to staff the event. Finally, Linda Apeles, manager of media relations at SHC, and Sara Wykes, staff writer of the communications office, were crucial to the event's success.

Holiday Food and Toy Drive Sponsored by Dean's Office

The Dean's Office is conducting a food drive to benefit Second Harvest Food Bank of Santa Clara and San Mateo Counties. By participating we have the opportunity to assist those in our community who are struggling to make ends meet and ensure that no child, family or senior goes hungry. Please join us in this effort to feed our neighbors who, each

month, have to decide between paying for rent, utilities, or medicine and providing food for their loved ones. Through your generosity we can help feed the nearly one quarter of a million people that Second Harvest Food Bank of Santa Clara and San Mateo Counties assists each month.

Food donations may be dropped off in the barrels located at LKSC - 1st floor and the Dean's Office, LKSC, 3rd floor. Please note the most needed food items:

- Meals in a can (stew, chili, and soup)
- Peanut butter
- Cans with pop top lids
- 100% fruit juices
- Canned fruit
- Canned vegetables
- Tuna/canned meat
- Low-sugar cereal

In addition, the Dean's Office will also be collecting donations for children who will be inpatients at the Lucile Packard Children's Hospital during the holidays. We are sensitive to the many celebrations at this time of year, and will work with the Office of Child and Family Life Services and the various chaplains to ensure that all children are recognized. Your gift of a new toy, clothing item, or craft supplies will go a long way towards brightening a child's hospital stay.

The gifts have to be brand new and unwrapped. The greatest need is donations for preemies, infants, and adolescents. Donations will be collected in the Dean's Office and the main lobby of the LKSC by the receptionist's desk between November 26th and December 14th. A donation "Wish List" will be available at these collection sites.

Thank you in advance for your participation!

Appointments and Promotions

- **Justin Annes** has been appointed to Assistant Professor of Medicine, effective 10/01/2012.
Profile: https://med.stanford.edu/profiles/Justin_Annes/
- **Shiva Avari** has been appointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 11/1/2012
- **Michael Bellino** has been reappointed to Clinical Associate Professor of Orthopaedic Surgery, effective 11/1/2012
Profile: https://med.stanford.edu/profiles/Michael_Bellino/
- **Latanya Benjamin** has been reappointed to Clinical Assistant Professor of Dermatology and of Pediatrics, effective 9/1/2012
Profile: https://med.stanford.edu/profiles/Latanya_Benjamin/
- **Sarah M. Carey** has been appointed to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 12/1/2012
- **Jin H. Chang-Yu** has been appointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 11/1/2012

- **Frederick Chin** has been appointed to Assistant Professor (Research) of Radiology effective 2/01/2013.
Profile: https://med.stanford.edu/profiles/Frederick_Chin/
- **Stephen Fisk** has been reappointed to Clinical Professor (Affiliated) of Anesthesia for the period September 1, 2012 through August 31, 2017
- **Matthew J. Garabedian** has been appointed to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 11/1/2012
- **Jack Yu Jen Huang** has been appointed to Clinical Assistant Professor of Obstetrics and Gynecology, effective 11/1/2012
- **Daniel Katzenberg** has been appointed to Clinical Assistant Professor (Affiliated) of Neurology & Neurological Sciences, effective 11/1/2012
- **Bruce S. Linenberg** has been promoted to Clinical Associate Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 11/1/2012
- **Anne Yee Liu** has been appointed to Clinical Assistant Professor of Pediatrics and of Medicine, effective 11/1/2012
- **Daphne Ly** has been reappointed to Clinical Assistant Professor (Affiliated) of Surgery, effective 9/1/2012
- **Birgit Maass** has been reappointed to Clinical Assistant Professor of Anesthesia, effective 5/1/2013
Profile: https://med.stanford.edu/profiles/Birgit_Maass/
- **Denise Monack** has been promoted to Associate Professor of Microbiology and Immunology, effective 10/01/2012.
Profile: https://med.stanford.edu/profiles/Denise_Monack/
- **Dung Nguyen** has been appointed to Clinical Assistant Professor of Surgery, effective 11/1/2012
- **Neda Pakdaman** has been promoted to Clinical Assistant Professor of Medicine, effective 11/1/2012
Profile: https://med.stanford.edu/profiles/Neda_Pakdaman/
- **Phillips Perera** has been promoted to Clinical Associate Professor of Surgery, effective 10/16/2012
Profile: https://med.stanford.edu/profiles/Phillips_Perera/
- **Elizabeth Price** has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 11/1/2012
- **Tohru Sato** has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine, effective 7/1/2012
- **Neil Schwartz** has been promoted to Clinical Associate Professor of Neurology & Neurological Sciences, effective 1/1/2013
Profile: https://med.stanford.edu/profiles/Neil_Schwartz/
- **Aimee Shu** has been appointed to Clinical Assistant Professor of Medicine, effective 11/1/2012
- **Laura Tarter** has been appointed to Clinical Assistant Professor of Medicine, effective 11/1/2012
- **Tessa Walters** has been promoted to Clinical Assistant Professor (Affiliated) of Anesthesia, effective 11/1/2012

- **Katherine Warner** has been reappointed to Clinical Assistant Professor of Ophthalmology, effective 4/1/2012
Profile: https://med.stanford.edu/profiles/Katherine_Warner/
- **Wolfgang Winkelmayer** has been reappointed to Associate Professor of Medicine, effective 10/01/2012.
Profile: https://med.stanford.edu/profiles/Wolfgang_Winkelmayer/
- **Joy Wu** has been appointed to Assistant Professor of Medicine, effective 10/01/2012.
Profile: https://med.stanford.edu/profiles/Joy_Wu/
- **Jennifer Young** has been promoted to Clinical Assistant Professor of Medicine, effective 11/1/2012

Dean's Newsletter November 19, 2012

Thank You

I will be brief, which I fully recognize is at variance with my previous 263 *Dean's Newsletters*. Since I accepted the invitation of President John Hennessy to join the Stanford community as Dean of the School of Medicine in December 2000 through now, I have had the privilege of working with thousands of students, faculty and staff on behalf of Stanford Medicine. Through our shared goal in achieving the decade-long strategic plan *Translating Discoveries*, we have witnessed the continued evolution of excellence in our missions in education, research and patient care that have been aimed to better serve our communities, locally and globally. Today Stanford Medicine stands proudly as one of the very best academic medical centers in the world – thanks largely to your efforts. Of course the journey has had its debates, its ups and downs, its champions and detractors, its leaders and followers. While I recognize that I have sometimes been a lightning rod for change, I have always tried to put the future of Stanford Medicine first and foremost.

More importantly, you have been the source of illumination and luminescence. Along the journey I have done my best to create connections between students, faculty and staff across the medical school, medical center, university and community. Today we stand more united and unified in our commitment to discovery, innovation and to doing all we can to make Stanford Medicine a model of excellence for our community, the nation and beyond. Of course this is a journey that will continue long into the future and I am honored to have served with you for one small set of time points. This month is an ending for me personally but a beginning for the leadership Dr. Lloyd Minor will bring to Stanford in the years ahead. It is also a continuum that has its deep foundations in the outstanding contributions that each of you brings to Stanford.

I wish you and your families a very happy holiday season and look forward to Stanford's continued excellence into the future. Thank you very much and very best wishes to all.
